10,470. You stated, did you not, that the maximum charge authorized by Act of Parliament is $1\frac{1}{4}d.$ per ton per mile?—Yes, on pig iron, and $1\frac{1}{2}d.$ on bar iron.

10,471. But that the railway company do, in some cases, charge as high as $2{\cdot}28d.$?—Yes.

10,472. If you deduct the $9d.$ per ton off the $2{\cdot}28d.$ per mile, what would that reduce the charge per ton per mile to?—I will take the rate from North Staffordshire to Manchester. The rate upon pig iron is $4s.$ $6d.$ a ton; the parliamentary rate of carriage is $1\frac{1}{4}d.$ per ton per mile, $3s.$ $1\frac{1}{2}d.$, and that leaves $1s.$ $4\frac{1}{2}d.$ as the terminal charge. But they are not entitled to charge this sum unless it costs it; they can only charge a reasonable sum for putting it into a siding and taking it out, therefore there arose a dispute between the freighters and the company, which has now lasted for three or four years.

10,473. Is not that the interpretation of the freighters?—The Act of Parliament says "a reasonable charge."

10,474. But is your interpretation a reasonable one?—That is the difficulty; that is the question at issue.

10,475. You seem to interpret it as meaning, no more than it costs them?—It is the interpretation that all the world of freighters put upon it.

10,476. (*Capt. Galton.*) Has that been tried in an action at law?—I am not aware that it has.

10,477. Would not the freighters be able to bring it before the Court of Common Pleas?—No doubt; but the Honourable Commissioner must be quite aware of the disinclination that freighters have to go to law with a great railway company, and the disinclination also that a great railway company has to go to law with the freighters upon a great principle like this. I dare say it will be in the recollection of the Commissioners that in the session of 1861 a conference between the chairmen of committees, the chairmen of the railway companies, and the freighters was held, with a view to endeavouring to frame a clause which should control and define this charge for terminals. They tried to frame a clause that should be introduced into all the Bills then before Parliament to effect this, the railway companies contending for a maximum of $9d.$ a ton at each end of their line, to which the freighters objected as being excessive. They could not agree, and the matter relapsed into the uncertain condition of the law as it now stands.

10,478. (*Mr. Ayrton.*) How do you arrive at the charge of $9d.$ a ton?—I cannot arrive at it. I only take the parliamentary rate from their general charge, and the residue represents the terminal charge.

10,479. (*Mr. Glyn.*) It appears to be $8d.$ and not $9d.$ a ton?—It varies.

10,480. In the case that you instanced just now it comes out at $8d.$?—In this table it varies very much; it comes out at $8d.$ in that case.

10,481. (*Mr. Ayrton.*) Are there any other rates which would enable you to state how much has been added to the parliamentary charge for terminal charges?—Yes. I will confine myself to North Staffordshire, with which I am more familiar with respect to terminal charges, because I have more to do with the terminal charges there than in South Staffordshire. Take the case of pig iron from Longton to Harecastle, the works with which I am connected being situated close to Harecastle; the rate is $1s.$ $8d.$ per ton, and that leaves $9\frac{1}{16}d.$ as a terminal. From Apedale, $10\frac{3}{4}$ miles, the rate per ton is $2s.$, leaving a terminal of $10\frac{9}{16}d.$ From Silverdale it is the same. From Shelton the rate is $1s.$ $6d.$ per ton, and the terminals $11\frac{1}{2}d.$; and from Manchester the rate per ton is $4s.$ $6d.$, and the terminals $1s.$ $4\frac{1}{2}d.$

10,482. Is that the terminal charge at both ends?—Both ends, I conclude; we have no means of knowing. Upon bars from Longton it leaves a terminal of $1s.$ $11\frac{3}{8}d.$; from Apedale, $1s.$ $7\frac{7}{8}d.$; from Silverdale, $1s.$ $7\frac{1}{8}d.$; from Tunstall, $2s.$ $3d.$; from Shelton, $2s.$ $3\frac{1}{2}d.$; from Liverpool, $10\frac{1}{2}d.$; and from Manchester, $1s.$ $3d.$ So that the inference from these charges would be that where the parliamentary rates are unprofitable, they supplement the rate by what we call an extravagant terminal charge at each end.

10,483. (*Chairman.*) What remedy do you suggest for that?—I must leave the remedy to the Government.

10,484. (*Mr. Hamilton.*) But is the charge by Act of Parliament $9d.$ at each terminus?—I believe the law stands thus; that they are entitled to a reasonable charge for the service that they do off their own line, so that if they put the trucks of a freighter from their own line on to his siding, they are entitled to a reasonable charge for that, but that charge shall not exceed $9d.$ a ton.*

10,485. Is that $9d.$ a ton at each terminus?—I suppose so.

10,486. (*Capt. Galton.*) Is that in the Acts of Parliament?—$9d.$ is in Acts of Parliament, I believe.

10,487. In what Acts?—I believe in all the Acts; at least I understand so. I am sure that it is in some Acts, because I have been brought in contact with it.

10,488. (*Mr. Glyn.*) It is limited, you say, to $9d.$?—Yes.

10,489. Can you inform us, from your experience as a railway director and also as an ironmaster, what you think ought to compose the terminal charges and the amount under each head?—It is very difficult to say what ought to compose the terminal charges. I should simply say that they should charge for putting trucks into sidings, and there their duty should cease. If the freighter requires them to do anything more than that, such as loading, unloading, covering, or what not, then the Acts prescribe that they shall make a reasonable charge for that service.

10,490. There must be an allowance for office expenses; then there is the working through the clearing house and for that there must be an allowance also; it is not merely the manipulations on the line that is paid for?—Some indifferent party must decide what this expense should be, and what I should propose is, that the Board of Trade should be the tribunal to which the freighter might appeal. I say as a freighter, that if you charge me $9d.$ a ton, or $7d.$ or $8d.$, whatever it may be at each end of the line, I may think it too much. The railway company says, "I do not think it is too much, and I insist upon "having it paid." I have never yet heard of an instance in which the matter has been brought to an issue. I once had a dispute with the North Staffordshire Company in a case in which they charged what I considered an excess of their legal rate, and I objected to pay them, whereupon they said, "Very "well, then we will stop your trucks until you pay "the rate beforehand." I said, "Very well, when "you have done that I will bring an action against you "for charging more than you are entitled to under your "Act; and on the other hand, if you like to bring an "action against me I will defend it, and that will bring "the matter to an issue." They declined bringing an action, and they did not compel me to pay the rate at the time that I declined to pay it, and so it ended in a sort of drawn battle; they conceded the greater part of it, and I yielded the rest.

10,491. Have they charged you a lower rate ever since?—Yes, ever since.

10,492. (*Capt. Galton.*) Have the trade all been treated in the same way?—No doubt. The rate is not so low as I contended for, but they have charged a lower rate since then.

10,493. (*Mr. Hamilton.*) Do you consider that the railway companies supplement the limit imposed upon their mileage rate by Parliament by imposing what is practically an unreasonable terminal charge?—I say so, for short distances.

10,494. They make use of this indefinite term, "reasonable," to supplement the mileage rate?—No doubt. I dare say the railway companies would tell me, It is an unprofitable traffic to them. I dare say it is, but as they engross the whole of the traffic

* The witness afterwards withdrew the portion of this and several other answers defining the charge at $9d.$ per ton.

they are bound to do it whether it is profitable or unprofitable; and they are bound to do it upon the terms prescribed by the Act of Parliament.

10,495. Did not you start by undertaking to explain how it was that for those short distances the railway company alleged that the traffic was unprofitable to them?—Their allegation is general. They only state this: it is unprofitable for those short distances, therefore we must charge you this higher rate; and they supplement that charge by saying, we must charge a higher terminal at each end of the line.

10,496. Then they virtually acknowledge that they put on a higher terminal charge in order to supplement what they say is an inadequate mileage rate?—No doubt.

10,497. (*Mr. Ayrton.*) Were the parliamentary rates which you have taken out the rates including trucks and locomotive power?—I have taken them as inclusive of trucks and locomotive power. Those are the maximum charges under the acts. There are two descriptions of charges: there is a separate charge for trucks, for locomotive power, and for use of the railway; and there is a subsequent clause which says that the whole of those rates collectively shall not exceed a given sum. It is that sum which I have taken, where the railway companies find trucks, and I have done that for the sake of uniformity.

10,498. (*Chairman.*) To return to the former question, what do you propose with regard to the unequal rates which now exist? I do not understand you to propose that the rates should be equal throughout the country, but only that such rates should be established as should be fair between the different localities. By what means would you fix those rates?—It is a very difficult thing to say how we should remedy the evil with which we have to deal as the state of the law exists, but I think that if a railway company charge a very low rate into a district from a distance, they should charge the same low rate out of that district to the neighbourhood. Perhaps for very short distances they should not charge quite so low a rate as for long distances, but there should not exist the great discrepancy which exists now. South Staffordshire and North Staffordshire are very injuriously affected in that respect, as you can readily understand. They have no means of availing themselves of any seaport accommodation, and there are iron districts, particularly new ones like Middlesborough and other districts similarly situated, that have the advantage of the sea-board, and have the advantage also afforded them of a very low rate of railway transit, so that they compete with us first by means of sea and river accommodation to London and other places not available for Staffordshire, and next by railway by the low rates that are given to them.

10,499. (*Capt. Galton.*) If the railway companies coming out of that district did not carry their goods at a low rate, would they have any of their goods at all to carry?—Of that question the directors are better judges than I am; the probability is that they would not get as much as they do.

10,500. Would not they reasonably complain of it as a hardship that they were prohibited the enjoyment of their low rates?—I think that the public have no right to complain however low they choose to make their rates; but I say, let all the world have the advantage of it; do not charge a low rate in one case and a high rate in another.

10,501. You mean that you would not let the railway company make its profits out of a district where there is no competition, in order that they may gain traffic from a district where there is competition?—Yes; otherwise you may aggrandise one district to the serious disparagement of another, and affect the value of property indefinitely at the caprice of a railway company.

10,502. (*Mr. Glyn.*) If a railway company lowers its rate for the purpose of competing with the sea-board, you say that it is fair that that same rate should operate over the whole system?—Yes, for the same class of traffic; because you give the parties on the sea-board a double advantage over the inland trade, seeing that they have a low sea freight which the inland ironmasters cannot compete with.

10,503. Then you would not take into consideration any one of the circumstances which might operate with the railway?—I should be very unwilling to admit any circumstances that would give an advantage to any district that had already got the advantage of sea or water communication.

10,504. Then you would deprive the directors of all right of using discriminating rates?—I would not let them go beyond their Act of Parliament.

10,505. But you know they must be within their Act of Parliament?—If they work within their Act of Parliament it is very difficult to interfere with railway companies.

10,506. (*Mr. Ayrton.*) Your principle is, that if once a company make a reduction of any rate, that reduction should be made throughout the whole of the lines of that company?—I think it should. I think I have a right to say this. Take the London and North-western by way of illustration, not because they are greater sinners than other railway companies, for, on the contrary, I think that the public is very much indebted to the London and North-western for the great amount of tact and judgment and discretion which they display in the management of their railway; but I will take them as an illustration, and I say, you bring pig iron from Middlesborough into South Staffordshire, and you bring it at $\frac{3}{4}d.$ or something less per ton per mile. I have pig iron in South Staffordshire which I want to send to Liverpool or to Manchester; take my pig or bar iron out of South Staffordshire to Liverpool, Manchester, or London at the same railway rate as you bring Middlesborough pig iron into South Staffordshire.

10,507. Do not you think that that system would have the effect of discouraging reduction on the part of railway companies?—No, I think it would not. It might perhaps interfere in some small degree with the profits of the railway company. I do not know that even it would do that, but at all events my argument is that that would only be equitable for the freighters.

10,508. I mean, would it not discourage the company from reducing its rate in any case, if it were compelled by law to reduce its rate throughout its whole system if it reduced it on any particular part of the line?—Possibly it may; but if it prevented the company from doing that which is inequitable, it would be a proper thing to do.

10,509. (*Capt. Galton.*) If I understand you, your argument would be that if the company choose to reduce their rates between, we will say, Middlesborough and South Staffordshire, the traders of South Staffordshire should have a right to arbitration as to what the rates should be from South Staffordshire to Liverpool?—Clearly.

10,510. And that rate you would have fixed by some tribunal outside the company and the traders?—Yes, outside the company itself.

10,511. (*Mr. Glyn.*) You would not fix the rate from Middlesborough to South Staffordshire at a certain amount, but you would put it in as an element of consideration when you send it to arbitration?—I would fix it at a certain rate unless the railway company should show very good reasons why that should not be the rate.

10,512. (*Sir R. Hill.*) That is to say, the same rate upon the same system of lines?—Yes.

10,513. (*Mr. Glyn.*) When you speak of the London and North-western Railway Company as making the rate from Middlesborough, are you sure that you are quite accurate as regards the fact; do they make the rate from Middlesborough?—I speak of the railway system generally, not of any particular company.

10,514. You are taking a rate made by another company, and applying it to the London and North-

Mr. W. Mathews.
13 Dec. 1865.

western, or any company in that district that may have nothing to do with the rate?—I am speaking of the railway system generally. I do not charge this particular sin upon the London and North-western; I charge it as a sin upon the general railway system of the country.

10,515. (*Capt. Galton.*) The London and North-western Company must be a party, must it not, to any rate over its line?—Yes, the London and North-western and the Great Western are the two companies with which we have to deal, and whatever arrangements are made must be made through them. The arrangements with other companies are subsidiary to the arrangements that we make with them; we have only these companies to whom we can apply.

10,516. (*Mr. Ayrton.*) You do not carry your idea of uniform rating to the extent that if one company reduces its rate another company is to be bound to do the same?—No; our difficulty with the railway system is this, that one company may say, I will reduce my rate, and another company may say, I will not; but the system now is so worked that, I think, there is very little difficulty on that score. If the major part of a series of railways consent to carry at a certain rate, I think they generally persuade the minority of the series to co-operate with them.

10,517. Would you propose that the law should compel any one company to reduce its rates because another company had reduced its rates?—All these are questions which it is very difficult for me to propose specific remedies for. What I have to do here is to state facts as they exist; I must leave it to this Commission to suggest remedies.

10,518. (*Capt. Galton.*) You have had such great experience as a railway director as well as a freighter, that this Commission would be very glad to have the benefit of your experience?—I should not like to take upon myself the responsibility of propounding a scheme for remedying the existing evil; the subject is so manifold, that I should have difficulty in embracing it in all its bearings.

10,519. (*Mr. Ayrton.*) If you cannot suggest any possible remedy, do you not think that it is one of the inequalities of trade to which all trade is subject?—All trades are not controlled by Acts of Parliament and governed by specific laws; mercantile affairs are controlled by the reciprocal arrangements of individuals with whom you trade; whereas the acts of railways are professed to be controlled by Parliament.

10,520. (*Mr. Hamilton.*) They are parliamentary bodies constituted under Acts of Parliament?—Yes.

10,521. (*Mr. Ayrton.*) Are not the different situations of works elements of inequality quite apart from the railway companies?—They are to a certain extent, but of course I confine myself to speaking of district as against district, without going to individual works.

10,522. (*Capt. Galton.*) As long as trade was confined to the roads, all traders had the same facilities along those roads, had they not?—No doubt.

10,523. What you contend for is that, now that railways have monopolised the whole carrying trade of the country, equal facilities should be afforded by railway?—I say so.

10,524. (*Sir R. Hill.*) You think that because you suffer from natural inequalities, that is no reason why you should also have to suffer from artificial inequalities?—Clearly so.

10,525. (*Chairman.*) What is the nature of the tribunal which you would propose for the purpose of deciding on these questions of rates?—It appears to me that the Board of Trade is the natural court of appeal to which individuals should apply if they find themselves aggrieved upon any of these points; but I think it will be for this Commission to frame suggestions upon that subject. The public would be more satisfied with the decision of this Commission than they would with the suggestion of any individual.

10,526. (*Mr. Ayrton.*) Your suggestion of uniform rates is not capable of any clear definition unless you will yourself give a definition?—I am aware of that, and I have great difficulty in giving a definition.

10,527. You suggest that which is not intelligible if you do not give it a definition which makes it so. I want to gather from you a definition of what you mean by uniform rates, whether you mean that the rate is only to be uniform on one railway, or whether it is to be uniform on several railways, or on all railways?—The representation which I wish to make to the Commission is this: that if a rate is charged for pig iron, we will say, into a district, the same rate should be charged out of that district, and I leave it to the company which happens to have the control of that district by its lines to adjust the subordinate arrangements with other railway companies with which it is in connexion. If they can arrange with other companies to adopt a low rate into the district, surely they can arrange with other companies to adopt the same low rate out of the district; I should imagine that there could be no difficulty in that; I cannot suggest anything further than that.

10,528. You do not propose that there should be any legal compulsion upon the companies to fix a uniform rate?—I think that what the public have to do is to state their grievance, and it is for this Commission to propose and for the Government to adopt what remedies for that grievance they think right.

10,529. (*Chairman.*) When you talk of fairness, surely taking goods from a district which has other means of sending away its goods is a less service than taking goods from a district which has no other means of sending away its goods?—Then it is a very great hardship upon the district which has no other means of sending away its goods but by railway if it is to be subject to higher railway rates.

10,530. Does not the hardship result from the situation of the district, and not from the operation of the law?—Then you may remedy that by admitting that at all events we have a right to claim that a district which has favourable sea communication shall not be placed in a more advantageous situation with respect to its inland communication than another district which is entirely insulated.

10,531. (*Sir R. Hill.*) The law does now fix maximum rates for each railway, does it not?—Yes, but I think that few railways act up to their maximum, except upon short distances.

10,532. There is at present no uniformity, is there, as regards those maximum rates?—I think so; I think that the Acts of Parliament lay down an uniform rate now pretty generally.

10,533. For all railways?—Yes, I think so, for all railways. I do not mean that all railways are precisely alike. In separate railway companies the rates may slightly vary.

10,534. Is the maximum of one railway the same as the maximum of every other railway?—I think not, but I am not quite certain as to that point.

10,535. Supposing there be a difference, you would probably think it advantageous for the public that one maximum rate should be applied to all railways?—I would leave the railway companies in the enjoyment of their present rights as prescribed by Act of Parliament; but in the exercise of those rights, if you reduce the rates to one party, I say you should do so to other parties also.

10,536. You simply recommend that upon the same system of lines the rate imposed should be a uniform rate?—Exactly.

10,537. With regard to the lines connecting Middlesborough with London, for instance, at present those lines have a very low rate of charge to London for iron?—Yes.

10,538. And you consider that that low rate of charge acts disadvantageously to you in respect of your proceedings in Staffordshire?—It does.

10,539. Supposing the law to require that the lines connecting Middlesborough with London should charge that low rate throughout, would not that obligation tend to prevent the companies establishing a low rate in the first instance?—I think it would.

10,540. And in that way the competition which injures you would be very much mitigated ?—No doubt it would be so to the public.

10,541. (*Mr. Ayrton.*) What would you do with the case where railways are amalgamated, and one has a lower rate than the other ; would you make it a condition of amalgamation that the rates should all be reduced to the lowest rate ?—Where they are amalgamated, I should say that the lesser branch of the amalgamation should adopt the rates of the greater branch. Generally speaking, the smaller lines have quite as high, or higher rates, than the larger ones. But that is a mere speculative point, upon which it is very difficult to give any authoritative dictum.

10,542. (*Sir R. Hill.*) Is not it usual in the case of amalgamation to impose one maximum rate over the whole system of amalgamated lines ?—Yes. Amalgamation must take place, of course, by Act of Parliament ; and I think that the public generally are sufficiently alive to their own interests to watch the amalgamation, and to control in some degree the rate of charge that is to be made on the amalgamated system.

10,543. Is not the result generally to adopt the lowest rate existing upon any one of the lines previously to the amalgamation, and to apply it to all the amalgamated lines ?—I think it is. I think the public are sufficiently vigilant to take care of that.

10,544. (*Mr. Glyn.*) That has almost been the rule in amalgamations lately, has it not ?—I think it has.

10,545. What would you consider a reasonable notice of the alteration or modification of any of the rates ?—A month's notice, I should think, would be sufficient.

10,546. That is generally given now, is it not ?—I think it is.

10,547. (*Sir R. Hill.*) But not always, I presume, as there are complaints on that score ?—No, it is quite arbitrary.

10,548. (*Mr. Glyn.*) It would be very desirable, would it not, to have some specified time at which notice should be given before a change takes place ?—I think it would.

10,549. (*Mr. Hamilton.*) Do the railway companies in your district give you a printed notice of their existing rates ?—No.

10,550. How do you ascertain the rates for which you will be liable ?—By application to the office in all cases.

10,551. (*Sir R. Hill.*) Is that information given in a written document or by word of mouth ?—It is generally given by letter. For instance, I apply to the North Staffordshire Railway, and I say, give me your rates to various towns ; and they give me a list of 30 or 40 towns, and they say, this rate belongs to us for conveyance over our own line, and by the London and North-western, or the Lancashire and Yorkshire, as the case may be ; and from their office I get those rates in manuscript.

10,552. (*Mr. Hamilton.*) You have no security by the publication of those rates that you will be charged the same rates as other traders are charged ?—None at all.

10,553. Would you not think it a great protection to you if the rates were published ?—Yes, I think that publicity would be a great protection to us. No doubt the proceedings of railway companies, like those of individuals, are influenced less by regard for the public than their own interests. A freighter says, I will undertake to put so much traffic upon your line, will you give me a low rate ? And with that understanding the rate would very likely be a personal rate, and not applicable to the generality of the public.

10,554. (*Mr. Glyn.*) Such a rate would generally be for a large quantity, would it not ?—Yes ; there are various circumstances that enter into the consideration.

10,555. (*Sir R. Hill.*) Would there be any insuperable difficulty in publishing those rates, and at the same time providing for lower charges to those who send large quantities ?—No, but I think that that should be made public.

10,556. Would there be any difficulty in your opinion in making lower charges where the quantity of goods was large, and in making the fact that such charges were lower public by including them in this schedule of rates ?—I think it ought to be so for the protection of the public.

10,557. (*Mr. Hamilton.*) Considering the special privileges that railways enjoy, do you think it a sound principle that they should give an advantage to large traders which small traders do not enjoy ?—I think they should not. I think that is one of the objections, that they do give an advantage to the large trader to the detriment of the small trader.

10,558. Owing to the monopoly that the railway enjoys it does not fall under the same principles as those by which private individuals act in conducting their traffic, namely, that they will sell at a lower rate to a person who gives them a very large order than they will to a customer who gives them a very small order ?—I do not think that railways have a right to demand to be placed in the position of an individual in that case.

10,559. (*Capt. Galton.*) Do you think that any advantage would result from the publication of rates, in drawing attention to anomalies, and thus obtaining the redress of those anomalies ?—I think that very great advantage would be derived from the publication of the rates.

10,560. And that without any other intervention than the mere publication ?—I think that the mere publication would go very far in correcting many of the existing evils.

10,561. (*Sir R. Hill.*) Is there not a feeling amongst persons not connected with the railways that favouritism is sometimes shown in charging the rates ?—I think there is, but I have no direct charge to make myself upon that particular point, because it is one of those things that I have not considered, and without considering it I should not think it necessary to mention it to the Commission.

10,562. Whether that feeling is well founded or not, the publication of the tariff of rates would go a long way to prevent favouritism, would it not ?—I think it would.

10,563. (*Mr. Ayrton.*) Would publication do that, or would it be the law that would prohibit the company from charging less than their legal rates ?—If you published the rates, and any portion of the public found upon that publication that the railway company had stepped beyond the law, it would be for them to deal with it as they thought right.

10,564. The mere fact of the rates being published would not prevent the railway company making any arrangement they thought fit with an individual trader, unless every such transaction was reported to some office, published, and made the subject of a prosecution ?—The vigilance of the public, I think, would protect themselves in that matter. If they found upon publication of the rates that the railway companies made their charge upon the rates so published, and they found on inquiry that any exception was made in favour of individuals, I think they would soon put the matter straight themselves.

10,565. How would they be in any better position in that respect by the publication of the rates than they are in at present ?—If they found, as I before observed, that a railway company had deviated in favour of any individual from the published rates, they would have a right to demand that the railway companies should alter their published rates to the extent that they had deviated in favour of this individual.

10,566. But they have the right now, under such circumstances, to demand a reduction of rates for themselves, which is the matter with which we are more immediately concerned ?—The difficulty in dealing with the railway companies is to know what individuals they do favour, or whether they do favour any individuals.

Mr. W. Mathews.

13 Dec. 1865.

10,567. Then the mere publication would not be of any use; the nature of the transaction with the individual would be what you would want to get at, would it not?—No doubt it would, but I think you would get at it more easily upon the publication of the rates than you would by the present system.

10,568. Would not it be necessary, in order to get at that, not merely that the rate should be published, but that no transaction should take place with any individual unless it were published?—I think so; I think it should be published with some such stipulation.

10,569. Then you would have every transaction with an individual deviating from the published rates reported to the office, and also made public?—I think so. Without something of that sort to complete the publicity, it would only partially affect the object.

10,570. (*Mr. Hamilton.*) Surely, without going so far as that, the mere publication of the rate would be a greater protection than the public now enjoy, would it not?—I should like the fullest protection, and I think that publication would be a very good step in the right direction.

10,571. (*Sir R. Hill.*) It would remove all doubt, would it not, as to what the proper charge is?—Yes.

10,572. (*Mr. Glyn.*) But, on the other hand, it would not prevent any allowance being made?—If people choose to do wrong, it is a very difficult thing to prevent them.

10,573. (*Capt. Galton.*) Still the publication of the rates would be of very great assistance, would it not, towards detecting that wrong?—Yes.

10,574. (*Mr. Ayrton.*) Has anybody engaged in trade at any station any doubt now as to what is called the public rate?—Generally speaking they have not. They get a sort of general intimation of what the public rate is, but I do not think they get it as fully as they would if the rates were to be published.

10,575. Can they not get it by simply asking at the office for it?—They can.

10,576. (*Mr. Hamilton.*) But they have not this security, that the same measure which is given to them is given to other people, which they would have if the rates were published?—Clearly not. The publication of the rates would be a very great protection.

10,577. Is it not a fact that in every town where there are two competing railways under arrangements as to rates, the agents of both companies look very sharply after each other?—They do. I have always myself been an advocate for competition. I believe competition to have been the salvation of the public against the railway companies. Only two or three years ago, in the case of a railway bill upon which I gave evidence, there was an agreement put in amongst the clauses, after the evidence was finished, to the effect that three great companies, the Midland, the London and North-western, and the Great Western, should none of them make different charges or promote other lines, except with the consent of all three parties, whereupon people said, the competition of these railway companies has ended, as we always said it would end, in combination. This agreement puzzled me very much, and I thought that it had ended in combination; but another element sprung up which has destroyed in a great measure that combination, and that is the Contractors. When the great companies had ceased to make lines in districts where they found it not profitable or desireable to make lines, by some process with which I am not very familiar, a body of contractors started up to make railways, with this idea, that if a railway is made, one of those great companies will take to it when it is made; and it is found that although those great companies had made this compact between themselves, yet they were quietly encouraging those contractors in the construction of the particular lines that favoured their systems. That has, in a great measure, broken down this combination, and the public now are very much benefited by the enterprise of contractors who make railways in districts where the great companies would not make them, and where a railway would not be made but for those contractors.

10,578. (*Sir R. Hill.*) When you say that the public are benefited, I presume you do not include under the term "public" the shareholders of the railways?—I will leave the shareholders and the capitalists of every sort in England to take care of themselves. I have no doubt that they are quite competent to do so.

10,579. Still they are exceptions to the general public?—I am speaking as one of the public, and not as a railway proprietor. I dare say that I should feel, as many railway proprietors do, that they have had a very insufficient remuneration for their capital in many instances.

10,580. Can you conceive of any permanently efficient competition where the number of competitors is necessarily so limited as is the case with respect to railways?—Competition has gone on now for 20 years, and, as I before observed, when we thought it was closed by the combination of those three great companies, there was another element which opened up competition again, and it may go on for another 20 years, and I have no doubt that the public will be very much benefited by it. Therefore I think it a very salutary proceeding.

10,581. (*Mr. Hamilton.*) Is it not the case that, although competition has often ended in combination, the agreed rate under that combination has been a lower rate?—It has almost universally been so.

10,582. (*Mr. Ayrton.*) You have been asked whether the competition between two competitors is enough for the public; I want to ask you whether the competition to which we ought to look for the purpose of the protection of the public is not the competition of new lines being constructed if existing lines are worked at an excessive profit?—Clearly the competition in that case would be on the part of new railway companies.

10,583. And that is the open competition of all society against existing railways?—Yes.

10,584. (*Mr. Hamilton.*) But excessive charge to the public and excessive profit to the shareholders are not convertible terms, are they?—Not exactly.

10,585. (*Mr. Ayrton.*) You may suppose, may you not, that railway companies conduct their business with ordinary intelligence, and that they charge that which is most profitable to themselves?—I have no fault to find with the way in which the business of railway companies is conducted. I have no doubt that it is conducted with the greatest possible ability with regard to the interests of their shareholders.

10,586. Do you think it is desirable that we should look to the action of competition to keep down the charges by new lines being constructed rather than to any very special legislation?—I really cannot give an opinion upon that point.

10,587. (*Chairman.*) One of the general conclusions to which the Committee of the South Staffordshire Ironmasters' Association have come is, "that the same "charges should be made binding on all companies," I understand that you do not go that length?—With respect to the report of the South Staffordshire Ironmasters' Association, I may state that my time was a good deal occupied, and I did not attend their meetings. I am one of the committee for managing the dssociation, but I did not attend the meetings, and there is a good deal in that report which perhaps I should not quite concur in. Therefore I have left it to the secretary of the association to give his own views upon that particular point. I am not prepared to speak upon it.

10,588. (*Mr. Ayrton.*) Do you concur in the recommendations of the association as to the separation of the terminal charges from the mileage rate?—I do.

10,589. Do you concur in their classification of the terminal charges?—I do not quite.

10,590. Will you state wherein you differ?—I should say generally with respect to the termiual charges, that they should be kept entirely distinct from the mileage rate, and I would have individuals know exactly what

terminal charges they have to deal with. If they think that they are aggrieved by it they may have recourse to such remedy as the law affords, going either to the Board of Trade or elsewhere, and leaving it to them to assign the proper amount in respect of the duties that are done and for which the terminal charge is made.

10,591. Have you considered the possibility of making a classification of the terminal charges ?—There would be no difficulty in it in my opinion, because the terminal charge is really a very simple matter; it is simply for taking the trucks into the siding of the freighter and bringing them out again.

10,592. That is confined to the simple case where he freights from a siding and takes delivery on a siding ?—Yes.

10,593. That would be one class ; but have you gone through the whole subject, so as to consider any other cases ?—I have not, because I look upon the other cases as being outside the terminal charge. If the railway companies load and unload, and cover the trucks, they have a right to charge for that service beyond putting the trucks into the siding; that is a duty which they are not called upon to do except they can agree with the freighter to do it.

10,594. Do you think it would be possible to classify those extra charges and fix public rates for them ?—I think it would. It would be a matter of some difficulty, but they are mere mercantile questions, and all mercantile questions are settled eventually in one way or other between the public body and the individuals as between one individual and another.

10,595 Would you leave it to what may be called competition between the railway company and the general public to settle those rates ?—All except the mere transmission of the trucks into the siding and out of it ; that should be defined, because it is not often that there are two cases alike. The cases of the transmission of goods into a siding and bringing them out of the siding again vary so much under different circumstances, that it would be a very difficult thing to fix upon one general arbitrary rate for that duty.

10,596. You would, for these purposes, treat a station as a siding, and, the goods being there, you would then have the railway charge terminate ?—I would leave it to the freighter, and to the railway company to agree if they can, but if they cannot agree, I would have some tribunal like the Board of Trade send some person down to investigate the circumstances, and say what is a proper and reasonable charge.

10,597. Where would you have what may be called the fixed parliamentary charge cease ; would it be the trucks coming into a siding or a station, and would all the subsequent services rendered be the subject of account between the freighter and the railway company ?—I think the public would suffer no injury if it were left in that form.

10,598. So that if the parties would not agree, the freighter must take the goods at his own cost ?—Yes, he must do it by himself.

10,599. With regard to different places, would you make any difference between places such as London or Liverpool, and provincial towns, in respect of the terminal charge, such as you have defined it ?—Yes ; I think that would necessarily arise, as it would be a very difficult thing to apply a uniform rate in all cases.

10,600. (*Mr. Glyn.*) Practically that is the case now, is it not ?—Yes.

10,601. (*Mr. Ayrton.*) Where the goods were forwarded on by a special railway, such as the North London or the Metropolitan, would you consider the sum paid for that as a charge paid out in addition to the ordinary charge, or would you insist upon all those railways coming into the uniform mileage rate ?—That is a very difficult question ; I have not considered the subject sufficiently to give an answer that would satisfy the Commission upon that point.

10,602. (*Chairman.*) Have you any other suggestion to make to the Commission ?—No, I think not.

The witness withdrew.

Mr. Thomas Perry examined.

10,603. (*Chairman.*) Are you connected with the iron foundry trade ?—Yes.

10,604. And are you Chairman of the Iron Founders' Association ?—Yes.

10,605. Have you any statement to make to the Commission with regard to the classification on railways connected with your business ?—Yes ; what I wish to say of course is chiefly with regard to South Staffordshire, where my experience has been. I may say that the foundry trade of South Staffordshire is a very important one, scarcely less so than what is called strictly the iron trade, that being the making of pig iron and malleable iron. The castings used in this country in all large works are very numerous, but the rates which are placed upon most of them being so much more than those upon bars, the trade of the founder is very much restricted. The iron founder and the malleable iron maker each receives the same raw materials, the one melts the iron and puddles it and rolls it into bars, and the other melts the iron and casts it into a mould, and because one is called "bar" and the other "casting" they go at different rates. We think that where the values are the same, and where the convenience of loading the trucks is as good, the iron foundry trade of the kingdom should not be placed in a position less favourable than the general iron trade.

10,606. (*Capt. Galton.*) Are not those castings more liable to break than bar iron ?—This proposition is based upon the owner taking all risks, and that it should apply to those castings which are of good loading. That is the object of my argument, that where the loading is as good, and the value equal, there is no reason why what the iron founder produces from his foundry should be carried at a higher rate than that at which the iron master sends out of his mills.

10,607. Who is to be the judge of whether the loading is equally good ?—I think that that would be a matter of common consent between the railway officials and the founders. I think that if the general principle were established there would be no difficulty between the parties interested, the founders and the railway people.

10,608. (*Chairman.*) Can the castings be packed as closely as the others ?—Yes, certainly. The term "castings," perhaps, would lead one to think of things that are rather more of an ornamental character and of a more fragile nature, but such castings form a very inconsiderable part. The foundry trade includes very many heavy castings, which are required in every large work that is undertaken every day. The buildings that are being erected are now being made fire-proof, and chiefly with iron ; in all our offensive and defensive operations cast iron is combined with wrought iron ; and for all sanitary purposes, and gas and water, cast iron is very largely used. The railway companies have themselves lately included a great many of the lower priced castings in the bar iron classification; but the foundry trade consider that they have not gone far enough. They state in one of their own classifications they will take bearers, short girders, pipes, plates, and turn tables at the low rate that they take bar iron ; yet they exclude bridge work and castings, mill and forge, and other rough and heavy things, which the trade practically regard as the commonest and most general class of castings in a higher class. They use the term themselves, castings, mill and forge, *and other rough and heavy things.* I do not wish to give any evidence as regards rates, because I think that will be taken up by the iron trade separately ; but my object is to draw attention to the fact which I have stated, that the iron foundry trade so much assimilates to the iron trade, that we seek that the castings, where they are of equal value, should be carried at the same

Mr. T. Perry.

13 Dec. 1865.

rates. Where single castings are very heavy, of course special rates must be charged ; and where they are of excessive size, special rates must be charged ; or where the bulk would not be in proportion to their weight, then, in the same way as ships charge, let them be taken by a higher rate, or by the cube foot.

10,609. (*Mr. Hamilton.*) What do you mean by the expression "where the loading is equally good?" —I mean that where the ordinary servants employed at the railway station can load a truck in the same time, and lay it as well upon the truck as bar iron, and the railway people would not have more trouble with it.

10,610. (*Sir R. Hill.*) You think that the mere fact of goods being cast rather than forged or rolled is no reason why they should be charged a higher rate ?—Precisely.

10,611. (*Mr. Hamilton.*) I see that you wish to do away with this differential charge on the principle of bearing the risk of damage yourself ?—Yes.

10,612 Do you think that the classification ought to be very much modified in all cases in which freighters were willing to take the risk of damage upon themselves ?—I think so ; and for this reason I think that the margin adopted by the carrying companies, which we may look upon as an insurance to themselves, is very excessive. I think that people would prefer to be their own insurers, as they would be in that case.

10,613. You think that the railway company should in all cases be bound to give a freighter a rate free of damage and a rate subject to damage ?—I think so. I think that the producer of the goods is the best judge as to the risk of his goods. I may say also that in comparing castings with malleable iron, such as bars and sheets and plates, $\frac{19}{20}$ths of the castings consist of articles which are produced at a lower price from the pig iron than the malleable iron is ; so that it is not the case, as the railways profess, of charging according to value, because, on the average, the castings that are made throughout England are at a lower price than the bar iron that is produced.

10,614. (*Mr. Ayrton.*) The element here is the liability to fracture I presume ?—Yes ; if the railway company receives goods which it considers liable to be injured, and they ask a higher rate for them, no one can objeet ; but if the sender says, Well, I know what the goods are, and I am perfectly willing to take all responsibility. I only ask you to deliver them from one point to the other, and if they are broken it is my own risk.

10,615. Would the risk of loading and unloading the trucks then be in the hand of the trader or of the company ?—That would rest with the sender, because the liability to be injured is one of the incidental consequences.

10,616. (*Mr. Hamilton.*) Your argument is that the extra rate charged for insurance is excessive ?—Yes.

10,617. And that in many cases it would pay the freighter well to take the risk himself in consideration of having to pay a lower rate of freight ?—Yes ; there are damageable and undamageable rates charged now for different kinds of castings, but the point which I wish particularly to impress upon the Commission is this, that the castings made throughout England should not be mulcted in a higher rate of freight than the malleable iron.

10,618. (*Sir. R. Hill.*) At present you have no choice, you must pay a higher rate whether you are willing or unwilling to take the risk ?—On certain things. As chairman of the Founders' Association I appealed to the railway companies about their high rates of freight, and in February they issued a circular giving a classification of certain castings which they would take at bar iron rates, at the senders risk. But if taken at the railway company's risk, those castings were put in the next class above, but they have not in that classification included the bulk of the castings which ought to have been included, they have reserved a very large proportion of the castings which they do not give you the option of taking at a low rate.

10,619. (*Mr. Hamilton.*) Still they have admitted the principle ?—Yes.

10,620. (*Mr. Glyn.*) Your complaint is confined to that particular system ?—Yes, with regard to the castings.

10,621. (*Mr. Ayrton.*) Do you understand why the railways have made this distinction ; do they differ from your opinion ?—I think it is simply this, that perhaps the railway companies think they must get a higher rate on some things than others to make up an aggregate income ; there can be no other reason than that.

10,622. (*Sir R. Hill.*) Would you make this additional charge for risk, dependent upon the value of the goods, or upon what principle would you arrange it ?—Yes ; it would be dependent upon the value and the little liability to injury ; that is to say, that castings principally are of a heavy and rough description ; they form, as it were, the materials from which other things are made, in the same way as bar iron does ; if a bridge is to be built, iron plates have to be sent to it, and castings too are, as it were, part of the raw material of which that bridge is made.

10,623. You would have that additional charge regulated with a view of covering the risk whatever it may be, and affording some profit to the company ? —Yes ; if a sender desires to send away his castings at an insured rate to the railway company, let them give that rate, but it should be a more reasonable one.

10,624. Speaking from your experience as a manufacturer, are you of opinion that such an arrangement would increase or decrease litigation ?—I think that it would decrease any litigation or dispute, because, if things are taken at the owner's risk there can be no difference of opinion.

10,625. There can be no litigation in that case ?— I think not.

10,626. And when they were taken at the risk of the company, that would be a fact which would be indisputable ? — Yes ; but the railway company may allege that they were improperly packed, or that they were of such a nature as ought not to have been sent, or something of that kind.

10,627. (*Mr. Glyn.*) That would be a question for proof when the trial came on ?—Yes.

10,628. (*Sir R. Hill.*) At present it is sometimes doubtful, is it not, when damage arises, whether the company is liable for the damage or not ?—Yes ; in some instances it may be. My chief proposition is, "That when the owner takes all risk and the loading "is equally good, there appears no reason why dif- "ferential rates upon castings should be charged," that is, supposing that they are within certain ordinary sizes.

10,629. (*Mr. Ayrton.*) Have you read the suggestions which were made by the South Staffordshire iron masters ?—Yes.

10,630. Do you concur in those suggestions as to the classification and otherwise of iron ?—Yes ; I am not a maker of bar-iron, and that is principally what their evidence turns upon.

10,631. (*Chairman.*) Would you leave it to the Board of Trade to make out this classification ?—Yes ; of course I presume that the Board of Trade would take their information from thoroughly practical sources. Unfortunately, I think that these classifications pass through the hands of those who are not acquainted with the particular objects which they class, and it requires some one who practically understands the separate kinds of castings.

10,632. (*Mr. Ayrton.*) I presume that you would finally have the classification of the rates fixed by law ? —Yes ; but the simple thing that I propose is, that all castings should go as bar iron does, under one rate.

10,633. (*Chairman.*) Have you any other suggestion to make ?—No ; I think not.

The witness withdrew.

Adjourned to to-morrow at half-past 11 o'clock.

Thursday, 14th December 1865.

PRESENT:

SIR ROWLAND HILL, K.C.B., F.R.S.
GEO. CARR GLYN, ESQ., M.P.
J. A. ROEBUCK, ESQ., M.P.
A. S. AYRTON, ESQ., M.P.
E. T. HAMILTON, ESQ., M.P.
CAPT. DOUGLAS GALTON, R.E., C.B., F.R.S.
J. R. M'CLEAN, ESQ., PRES. INST. C.E.
WILLIAM POLE, ESQ., F.R.S., *Secretary.*

THE RIGHT HON. LORD STANLEY, M.P., F.R.S., IN THE CHAIR.

Mr. WILLIAM WALKER examined.

Mr. W. Walker.

14 Dec. 1865.

10,634. (*Chairman.*) I think you are a member of the Chamber of Commerce of Wolverhampton?—Yes, I am.

10,635. Are you come up on this occasion as representing the Chamber?—Yes; and in addition to that, I may say as representing manufacturers and merchants who are not, perhaps, members of the Chamber.

10,636. Are you yourself a merchant?—Yes, I am a merchant in the hardware trade.

10,637. We understand that you are prepared to give evidence as to the inequality in the rates charged by the railway companies for the carriage of goods?—Yes, and the effect on the trade of Wolverhampton.

10,638. Can you give the Commission any instances of that inequality?—I will give instances, as far as my knowledge goes, with regard to Wolverhampton in particular. The rate which we pay for hardware from Wolverhampton to London is 30*s.*, and the mileage is 123 miles; from Wolverhampton to Liverpool the rate is 15*s.* 10*d.*, and the mileage 84; from Wolverhampton to Fleetwood, 15*s.* 10*d.*, 115 miles; from Wolverhampton to Glasgow 35*s.*, 290 miles; to Paisley, Greenock, and Dumbarton, though differing some little in distance, the same rates are charged, 35*s.*; from Wolverhampton to Aberdeen 45*s.*, 427 miles.

10,639. Are you speaking of hardware?—Yes, of hardware; it is classified under that term by the railway companies.

10,640. I presume that in taking an account of those disparities we ought to allow for the cost of collection and delivery being nearly the same for a short as for a long journey?—I fancy that that would mainly depend upon the town in which the goods were collected. I can conceive that the rate for collection would be more in a large town than it would be in a small one, the distances would necessarily be greater. From London to Liverpool the rate for hardware is 30*s.*, a distance of 201 miles; London to Glasgow, 45*s.*, 413 miles; London to Aberdeen, 40*s.*, 550 miles; that being 5*s.* less than the rates from Wolverhampton, thereby offering a premium in favour of London being the seat of the hardware trade.

10,641. The practical effect is that for commercial purposes you are placed at a greater distance from those northern towns than the London people are?—Exactly so. The rate from London to Bristol is 27*s.* 6*d.* a distance of 118 miles; from Wolverhampton to Hull it is 22*s.* 6*d.* Those are for hardware, and the rates that I will now give, are for nails. I have not had time to get the rates for hardware with certainty. For nails, from Wolverhampton to Bristol the rate is 17*s.* 1*d.*, and from Birmingham to Bristol 12*s.* 1*d.*, the distance being the same. From Wolverhampton to London the rate for nails is 25*s.*; Wolverhampton to Dublin, 25*s.*, including the sea freight, and risk of the sea from Holyhead to Dublin; Wolverhampton to Glasgow, 30*s.* I would wish now to speak of the difference in charges on the same 13 miles of railway between Birmingham and Wolverhampton for nails. Birmingham to London the charge is 21*s.* 8*d.*; Wolverhampton to London 25*s.*, the difference being 3*s.* 4*d.* Birmingham to Liverpool, 16*s.* 8*d.*; Wolverhampton to Liverpool 14*s.* 2*d.*, the difference being 2*s.* 6*d.*

10,642. (*Capt. Galton.*) Is it necessary that the traffic from Birmingham to Liverpool should pass by Wolverhampton; why cannot it go by the old Grand Junction Railway?—That is still in the hands of the London and North-western Railway Company.

10,643. Is it not the case that a good deal of the goods traffic goes along that line?—I think that the through traffic mostly goes on the Stour Valley line; but I do not think that it would affect the question at all which line it went by. There are a few miles difference in distance, but they are both near the town.

10,644. Still it would be shorter to Stafford by the old line than through Wolverhampton?—No; it is shorter to Stafford by the Stour Valley line.

10,645. From Birmingham through Wolverhampton to Stafford?—Yes; a few miles, there would not be much difference, but there is a little difference. I speak of the inequalities of the rates between Birmingham and Wolverhampton in particular.

10,646. If the traffic does not pass through Wolverhampton the comparison falls to the ground, does it not?—But it does pass through Wolverhampton. Even the Grand Junction line we call Wolverhampton; before the Stour Valley line was opened, that was the only station we had, and it is the old Wolverhampton station; it is a mile and a half to Wednesfield heath. I speak of the disparity there between Wolverhampton and Birmingham, but I do not find the same disparity elsewhere; for instance, there is no extra freight charged from Wolverhampton between Dundee and Aberdeen, though it is, I suppose, 55 miles farther, there is nothing charged extra for that 55 miles at all; nor is there anything extra charged for our freights from Wolverhampton between Perth and Stirling, though one is 31 or 32 miles shorter in distance than the other.

10,647. Do you mean that the rate from Wolverhampton to Perth is the same as the rate from Wolverhampton to Stirling?—Yes, exactly the same; and the same again from Wolverhampton to Dundee or Aberdeen, and yet there is 50 miles difference between the two.

10,648. (*Mr. Ayrton.*) Do all the rates which you have given include collection and delivery?—Yes. Now I come to a very important article with regard to Wolverhampton, and that is steel. It is largely used in the manufacture of edged tools, and is very indispensable to the manufacturers. The seat of this manufacture is principally Sheffield, and I will show how we are served in the article of steel with regard to the freight of that article. The freight of steel from Sheffield to Wolverhampton and Birmingham is 25*s.* a distance of 87 miles; but the freight from Sheffield to London is 22*s.* 6*d.* a distance of 166 miles, so that the Sheffield people deliver steel in London at a lower rate than in Wolverhampton where it is most wanted, and where it is the essential thing next to iron to the manufacturers.

10,649. Is that by the same line of railway?—There are two lines of railway from Sheffield, the distance by one being rather more than by the other, but the rates are the same by both. It is a very singular thing, speaking of Sheffield freights, that they make a difference of five shillings in favor of Birmingham on hardware, cutlery, files, saws, and edged tools. The distance from Birmingham and Wolverhampton to Sheffield is nearly the same, and yet we have to pay five shillings more than the Birmingham people.

10,650. (*Chairman.*) Have you any other instances

Mr. W. Walker.
14 Dec. 1865.

of the same kind which you wish to mention ?—If the principal Railway Companies were required to lay upon your table a tabular statement of their charges for railway freight, and if an actuary were allowed to dissect those charges, you would find them to confirm all I have stated, and a vast deal more, and to show still more unequal rates. I only speak of things that come under my own observation, but if you had the rates before you, they would speak for themselves.

10,651. (*Mr. Roebuck.*) Does the inequality generally tend against Wolverhampton ?—Yes.

10,652. Can you suggest any reason for that ?—I cannot, indeed. I would like to see a remedy for that which I conceive to be a wrong. I think, that if the entire rates were laid before you, they would demonstrate that the rates are levied without reference to profit or loss, that they are levied without reference to mileage, and that they are levied without reference to any principle of business, or even the cost of the lines. In many cases the rates are far too high, and in other cases perhaps far too low. They seem to demonstrate simply how much the railway company can take from one district, and how little from another.

10,653. Would you suggest that it is simply the consequence of caprice and ignorance ?—I can hardly give an answer to that question. I think that it arises principally from their all having too much to do.

10,654. Does not that resolve itself into ignorance ?—Into inattention, perhaps, arising from their having more to accomplish than they really can accomplish ; the traffic of the country has so enormously increased.

10,655. (*Chairman.*) Do I understand you to put it in this way, that they have so much to do that they do not want additional traffic upon some of their lines ?—No, I think that they grasp everything they can in their own hands, whether they can convey or not. I know that at present the London and North-western Railway is fairly blocked up with goods.

10,656. (*Mr. Ayrton.*) Would the fact seem to be this, that from the pressure put upon them, the company have made reductions here and there without any consideration of the general system of rates ?—The memorial on your table was never intended to be placed before this Commission. It was intended simply as a memorial to the London and North-western and the Great Western, the two railways which are most intimately connected with Wolverhampton, in the hope of inducing them to make a reduction in those freights, by pointing out the discrepancies.

10,657. Do you think that those inequalities originated from pressure being put upon the companies by particular interests or by particular towns, and their making those reductions in particular cases without reference to the general system of rates ?—I think it arises entirely from this, that they cannot help themselves. For instance, as I have observed, the rates from London to Aberdeen are actually lower than they are from Wolverhampton to Aberdeen, but of course they have a sea freight there.

10,658. Would it not result from competition having grown up in any particular place, which has rendered it necessary for them to make a special reduction in the rates to that place to meet the competition ?—I do not think it arises from that, but it is because they have got to meet the water competition.

10,659. Therefore they have made a partial reduction to meet some special local competition without making a reduction in other places, and hence these inequalities ?—Yes.

10,660. Do you think that that is the general character of the inequality, that it has arisen from special local competitions either of water, carriage, or of other railway companies ?—I think it is more a study on the part of the railway companies how much they can really get.

10,661. It would involve this, would it not, that they charge as much as they can till they are compelled, by competition somewhere, to reduce the rate ?—I can hardly answer that question.

10,662. (*Mr. Roebuck.*) Is it not that they charge as much as they can in every place, but that in some places they can charge more than in others ?—Yes ; that is exactly what I mean.

10,663. (*Mr. Ayrton.*) Why do they charge more in one place than in another, except that they are compelled to do so by competition ?—It is all by competition that the rates are kept down in some places. I am told that in some cases they carry wire from Warrington to London at lower rates than from Birmingham and Wolverhampton to London ; and the reason is that at Warrington they have river carriage, and that they have the sea freight down the Mersey in competition. Those rates act in fact as a protective duty in favour of other manufacturing towns to the detriment of Wolverhampton.

10,664. (*Chairman.*) Does not it come to this, that they carry cheap where there is competition, and that they carry dear where there is none ?—Yes.

10,665. (*Mr. Ayrton.*) They charge the full legal rates where there is no competition, and where there is competition they are compelled to reduce those rates considerably ?—I do not think it is a question of legal rates, but I think it is entirely a question of how much they can get.

10,666. (*Capt. Galton.*) With regard to this difference of rates between Wolverhampton and Birmingham to Sheffield, for instance, how does the traffic go to Sheffield ; does it go by the Manchester, Sheffield, and Lincolnshire Railway or by the Midland Railway ?—It would go by the Midland Railway.

10,667. Then in both cases it would go by the Midland Railway to Sheffield from Birmingham and Wolverhampton ?—It would come in at what we call the Dudley end from Birmingham, and it would go by the Midland ; and from Wolverhampton it would go partly by the Midland and then on by the South Staffordshire line.

10,668. (*Mr. Ayrton.*) Is there a canal between Birmingham and Wolverhampton ?—Yes.

10,669. And none between Wolverhampton and Sheffield ?—I can hardly answer that question. I think there is one.

10,670. Does your canal come in competition with the railway ?—The canals do not come in competition with the railways with us. We hear nothing of the canals now.

10,671. (*Capt. Galton.*) Are they all under the influence of the railway ?—Yes ; one might suppose that the canals would produce competition, but I do not think they do at all.

10,672. (*Mr. Ayrton.*) Is the Wolverhampton and Birmingham canal under the control of the railway company ?—I think it is so far under the control of the railway company that if they were to reduce the freights the railway company would instantly reduce a little lower ; so that they are always in a fix, and it is no use reducing the freights.

10,673. (*Capt. Galton.*) As to that canal, it is practically leased, is it not, to the London and North-western Company ?—I cannot tell.

10,674. Is it guaranteed by the London and North-western Company ?—I am not sure.

10,675. (*Mr. Glyn.*) At any rate they regulate their rates together ?—Yes, they regulate their rates together, and there is no competition.

10,676. (*Mr. Hamilton.*) In fact, the only competition of which the railway feels the effect is by the sea route, where it exists ?—Yes.

10,677. (*Sir R. Hill.*) Are there any differences in the mode and extent of collection and delivery in the several towns that will at all account for the discrepancies to which you have alluded ?—I do not think so, at all.

10,678. In Wolverhampton and Birmingham they would be much the same ?—Yes, much the same ; the delivery in Birmingham would probably be a little greater, it being a larger place.

10,679. And in London it would be very much greater ?—Yes.

10,680. (*Capt. Galton.*) You were mentioning, were you not, that the rates were the same from Wolverhampton to Perth, Stirling, Dundee, and Aberdeen ?—No. I mentioned that they were the same to Perth and Stirling at one rate, and to Dundee and Aberdeen at another rate.

10,681. I suppose that, practically, to those distant places the railway company charge that amount of freight which the traffic will bear ; that is to say, which will enable the nails or the material to be sold in that particular town, and they charge as high as they can consistently with not shutting it out of the market ?—I think that they may charge a little higher to Perth myself. I do not see why they should not charge a little higher to Perth than to Stirling from the midland districts.

10,682. Do you think that the traffic would bea it?—I do. I do not see why it should not from the midland districts, but I can understand why they do not from London, because there they get the sea freight in competition with them. But you see that here they actually carry those long distances without extra charge, whereas we have to pay 9*s.* 7*d.* between Wolverhampton and Birmingham for 13 miles.

10,683. (*Mr. Glyn.*) You include in that the charge for collection and delivery?—Yes.

10,684. (*Sir R. Hill.*) May not the charge for delivery and collection amount nearly to 9*s.* 7*d.*?—I think not, nothing like it. Then we are treated very differently with regard to the question of railway fares. If I book to London first-class from Wolverhampton, I pay 22*s.* 4*d.*, but if I book to Glasgow it is 49*s.*, and yet the rates for merchandise as between those cities are almost exactly the same, the difference in the passenger fare being 26*s.* 8*d.* Now goods have to be collected and delivered, while the passenger arrives and departs at his own expense.

10,685. (*Capt. Galton.*) Is it your argument that goods are carried at an unremunerative rate ?—I have nothing to do with that ; I think that the railway company have to look out for that entirely themselves, but I think that railway companies have taught us how very cheaply they can carry, and they should not blame us for asking them to carry out their own principles.

10,686. (*Chairman.*) Do you lay it down as a rule that they ought to charge the same rate for the same mileage uniformly?—I would not feel myself warranted to give an opinion upon that. I have not sufficiently thought of it.

10,687. (*Mr. Hamilton.*) You are not prepared to state upon what principle you think that the rates ought to be fixed?—No, I am not; I would rather leave that to people more competent to give an opinion upon it than I am.

10,688. But your opinion is that they are partial and capricious?—Yes, we think so, and that we in particular suffer at Wolverhampton. We are unfortunately situated at Wolverhampton. We are a very considerable distance from the sea-board, and in the very heart of the kingdom.

10,689. I suppose it is your opinion that it was not contemplated by Parliament, in giving certain privileges to the railways, that they should establish preferences in favour of one town against another?—Certainly not. All I would ask is for us to be charged alike. I do not complain of our local situation at Wolverhampton, but that we are placed at an artificial disadvantage by the rates that are charged.

10,690. (*Mr. Ayrton.*) Is there any place where nails are manufactured in competition with you?—Yes, there are several places. Cut nails are manufactured in Birmingham and Wolverhampton, and they are manufactured at Newcastle-upon-Tyne and at Leeds extensively.

10,691. If the rates were kept up from Wolverhampton to Perth and Stirling at the higher rate, it would be impossible for you to compete with the Newcastle manufacturers, would it not?—As a rule we are rather lower than the Newcastle price to start with.

10,692. But if you were to pay the full rates through to Perth, you would be placed at a very great disadvantage as compared with the water communication, which would be completely through from Newcastle to Perth ?—Yes, no doubt of it.

10,693. Therefore, is it not probable that the rates have been reduced in your favour, to enable you to compete with the Newcastle manufacturers ?—No, I do not think that that was ever taken into consideration. I think that those rates have been fixed merely from an idea of how much they can get.

10,694. Could you send nails from Wolverhampton to Perth, if you paid the full rate by the railway, as compared with the nailers at Newcastle sending by sea to Perth ?—It would be a question whether we could.

10,695. It would certainly be a difference against you, would it not ?—Yes, it would ; on nails a mere 3*d.* per cwt. is the profit.

10,696. Therefore, that would all vanish in the difference of rates ?—Yes, it would be a question whether we could retain our trade with Perth, I think.

10,697. Do you not think that circumstances like these are, to some extent, the cause of those peculiarities of rate ?—No, I do not think so.

10,698. Do you think that you would not lose a good deal, as well as gain, if you had a rigid rate all through the country, Wolverhampton being an inland town, as compared with the iron and other manufactures in the seaports ?—No, I think that we should be benefited by a revision of the rates, because, generally, the lowest rates are to places far away from us ; they are along the sea-board, and we are distant from the sea-board.

10,699. If the principle were adopted of not reducing the rates to meet the special circumstances of competition or of trade, would not it result in this, that the manufactures now carried on at Wolverhampton, would be transferred to the ports where they are connected with the iron manufacture ?—That would be a work of considerable time, because we have the raw material under our feet ; all the iron, coal, and labour, is located there.

10,700. But they have the raw material also under their feet, and the port in addition ?—Yes, but the class of iron is not so particularly adapted to the manufacture of particular goods.

10,701. (*Mr. Roebuck.*) Is it not a fact that, generally speaking, the rates from seaports to other seaports are lower than from inland towns to the seaports ?—Invariably so, I should say.

10,702. Then does not that answer the question put to you by the honourable member ?—I scarcely understood his question.

10,703. (*Mr. Ayrton.*) The principle that you object to is any reduction of rates to meet special circumstances ; if I understand you, you want a certain and uniform rate ?—I think we should approximate to it ; I do not say that we can arrive at a uniform rate, but we can certainly approximate to a much more uniform rate than the tables that I have read to the Commissioners to-day. Then, as far as Wolverhampton is concerned, it is a very serious thing, because the class of goods that are made by us are so cheap and so common, a great many of them, that the railway rates to the ports frequently range from 10 to 20 per cent. upon their value.

10,704. Upon what principle would you fix the rates, if they are not to be uniform ?—I am not prepared to offer any information upon that point. I am only prepared to show the baneful effect of the present rates upon our trade.

10,705. (*Mr. Hamilton.*) You stated in a part of one of your earlier answers, that the rates appeared to be fixed without reference to profit and loss. Did you mean profit and loss to the trader, or to the railway company ?—To the railway company.

10,706. (*Mr. Roebuck.*) What I understand from

Mr. W. Walker.
14 Dec. 1865.

you is, that you are here simply to state the facts of the case, and that legislation upon those facts you leave to other and wiser hands ?—Exactly so. I would wish to point out how very important it is that we should have reduced rates, particularly to London. The Australian trade is a very increasing trade with us, and so is the New Zealand trade. The best ships for those markets leave the port of London, and it is therefore very important to us that we should have low freights. Then again there is every prospect of a reduction of the tariff in Austria, and many other continental states. Common sense seems to be getting more prevalent in those countries, and low rates to London, to meet that trade, would be of the very greatest importance to us.

10,707. (*Mr. Ayrton.*) Is it not necessary, even in examining this question of rates, entirely to separate the terminal charges from the mileage rate ?—I have not considered that question at all. I come here simply to give an idea of the rates which we pay, and of the effect upon the trade of the town.

10,708. (*Capt. Galton.*) To state how injurious the present rates are upon the trade of Wolverhampton ?—Yes, but I do not treat those questions. Mr. Gibbs, who will follow me, will answer those questions.

10,709. (*Mr. Hamilton.*) With regard to your Australian trade, of course the railway would deliver goods in the docks, or alongside, without having the cost of distribution. Would they quote you a lower rate for goods intended for shipment than they would for goods intended for distribution in the town ?—No.

10,710. (*Capt. Galton.*) They would quote just the same rate ?—Yes, they would quote the same rate. Perhaps if a ship were in a peculiar position, lying away from the ordinary berth where ships lie, then the rate would be higher ; they would want an extra charge, but even then, if it was entered in ten ton lots, they would make a difference and not charge so much higher.

10,711. But in no case would they make you a lower rate ?—No, we have but one rate, and we never pay any but those rates that I have read over.

10,712. (*Mr. Hamilton.*) You have stated that London is the principal port for Australia ; London is not the principal port for the colony of Victoria, the principal port for that is Liverpool ?—There are a better class of vessels in London, and I am satisfied that London would have the trade if the freight were lower to London. The trade is about equally divided between London and Liverpool. Some of our best customers, if they have an office in London, have their goods for Victoria sent to London.

10,713. Are you right in saying that it is equally divided as regards the Australian colonies ?—I am speaking of goods leaving Wolverhampton, and I say that the freights are pretty fairly divided between Liverpool and London ; but if the rates were lower to London the large bulk of our goods would come here. I fancy that the insurance is effected rather lower on the London vessels than on the Liverpool vessels.

10,714. It is not within your knowledge that the principal port of shipment to the colony of Victoria is Liverpool ?—I state that I think that the trade is about equally divided as far as Wolverhampton is concerned.

10,715. (*Capt. Galton.*) In the earlier part of your examination you remarked that you thought one reason for the discrepancies in the rates was that either the directors or the companies have not time enough to look after them ; did you mean that they have not sufficient time to give to the proper consideration to the question ?—I think that they have such a large amount of business to do, especially in the case of the London and North-western Railway Company they do not investigate and inquire into the rates.

10,716. You mean that they do not look into the general arrangement of the rates, they merely look into each detail as it is brought before them ?—Yes.

10,717. (*Mr. Glyn.*) Has the present rate been going on for a great many years ?—Yes, for many years.

10,718. There has been no recent variation in the rates, has there ?—No, with the exception that as between Birmingham and Wolverhampton there has been some reduction upon nails.

10,719. But not between London and Wolverhampton ?—No.

10,720. Has the present scale of rates been going on for the last 15 years ?—I can scarcely say whether we can go so far back as that, but it is a considerable time.

10,721. (*Chairman.*) Have you only one railway company coming into Wolverhampton ?—We have the London and North-western Company, and the Great Western Company.

10,722. Then I presume there is competition between those two ?—The rates are always the same.

10,723. (*Mr. Hamilton.*) Is the rate lower than it was before the Great Western Company got access to Wolverhampton ?—I question if it is, but I cannot positively answer as to that. The distance from Wolverhampton to London by the Great Western Railway would be 18 or 20 miles more circuitous, and they take that 18 or 20 miles for nothing.

10,724. (*Mr. Ayrton.*) Have your firm ever entered into any personal communication with any of the railway companies on the subject of rates ?—Never.

10,725. (*Chairman.*) Do I understand you that there is no real competition between those two companies, but that they always combine ?—They run at the same rates, and that is the best proof.

10,726. (*Mr. Ayrton.*) Have you any objections to make to the present mode of classification of goods sent by railway as regards your trade ?—I think that if the present classification of goods were honestly held by it would be very disastrous to the railway companies themselves ; but it is not so held by. For instance, in the hardware trade there is a class of goods coming under the term "nails," but it is quite a common practice to declare as nails a variety of other goods, which are actually of less cost than nails and heavier. If it was all considered nails it would show an enormous quantity of nails manufactured by us.

10,727. You mean that they would declare that they were nails because if they were strictly declared they would go into a higher class ?—Yes ; and hence the railway company themselves are the principal benefiters by it, because they get a freight which they otherwise would not have.

10,728. The charge would be too great if they were charged in the higher class ?—Exactly so; they would not be sold.

10,729. In that respect it would seem that the classification is very imperfect at present ?—It is very imperfect, I think.

10,730. Do you think that it would be desirable that it should be entirely reviewed and a re-classification made ?—It would be desirable as far as this, that it would cause people to make more honest returns of what does go.

10,731. Is it your opinion that in those returns which you say want improvement, the people are not honest ?—I do not say that it is not honest, only it is saying that which is not really the case if you have a cask of bolts and nuts and call them nails, and send them at the charge for nails.

10,732. In the case of those returns which are inaccurate, do you think that the railway companies are conscious of the fact ?—Yes.

10,733. Being conscious of it they acquiesce in it, because they know that their classification is not satisfactory ?—The railway companies are quite aware of it, but the railway companies are more benefited than anybody else by not taking notice of it.

10,734. (*Capt. Galton.*) Are there any complaints of inequality of charge between individual firms at all? —Not amongst the hardware merchants.

10,735. (*Mr. Ayrton.*) You do not think that the inequalities which you have referred to have been in-

fluenced by any personal considerations ?—I think not amongst hardware merchants.

10,736. (*Capt. Galton.*) Do the companies charge less for a large quantity ?—No, not with us, as traders. I have heard that such things exist amongst the iron trade, but not amongst merchants.

10,737. (*Mr. Ayrton.*) Are you satsified with the minimum quantity or the maximum quantity that is fixed for the different rates as between the higher and the lower scale ?—I wish to have a revision, and I wish to see the rates, particularly from Wolverhampton to London, reduced.

10,738. I mean as regards the quantity, one or two tons, or a cwt., or whatever it may be ?—I think that as far as iron is concerned, I have heard great complaints in the town amongst dealers in iron that, in consequence of the railway companies requiring two tons to go and charging two tons as the minimum, they have lost their trade with many little country blacksmiths that could not order half that quantity, because the difference in the rate is fatal.

10,739. In the nail trade, and other trades of that description, do they generally take a less quantity than two tons for the purpose of working up ?—Yes; anything from two cwt. and upwards to two tons is charged at the same rate.

10,740. In the raw material, I mean ?—I have not anything to do with the raw material; I have simply to do with manufactured goods.

10,741. Is any allowance made for very large quantities in favor of great dealers ?—No allowance is made amongst merchants.

Mr. W. Walker.

14 Dec. 1865.

10,742. (*Chairman.*) Is there anything further that you wish to lay before the Commissioners ?—We have a considerable amount of competition in hardware with Belgium and the Zollverein. We come into competition with them in neutral markets, and they are able to deliver their hardware at a port cheaper than we are able to do, and therefore that is injurious to us; in fact, we have to pay 2*d.* per ton per mile at Wolverhampton, while other towns pay 1*d.* per mile for the same class of goods. We are interested in the railway companies charging a reasonably fair rate and making a profit, for we are quite satisfied that their business will never be properly conducted unless they do make a profit.

10,743. But I understand that it is not so much the actual amount of the rates charged that you object to as to the inequality between one place and another ?—Yes; and as affecting particularly a town so situated as Wolverhampton, a town in which many of the manufactures are so very cheap and common, and the freight of the goods bears so high a per-centage upon their cost.

10,744. I understand you further to say that you do not look upon competition between one company and another as a sufficient remedy for what you complain of, because it is always easy for them to combine ?—It is always easy for them to combine.

10,745. (*Capt. Galton.*) As far as your experience goes in Wolverhampton, they do combine ?—Yes; they do combine; the only difference is, that they have got to pay interest upon two capitals instead of one.

The witness withdrew.

Mr. Edward J. Gibbs examined.

Mr. E. J. Gibbs.

10,746. (*Chairman.*) You are secretary, I think, to the Chamber of Commerce at Wolverhampton ?—I am.

10,747. And do you produce the resolutions passed at a meeting of the Council held about six weeks ago ?—I do.

10,748. Those resolutions are contained are they not in a paper which you have sent to the Commissioners ?—Yes; and which I beg to hand in as part of my evidence.

The same was delivered in, and is as follows:

Resolutions passed at a Meeting of the Wolverhampton Chamber of Commerce, held on Tuesday, 31st October 1865.

1. That inasmuch as Railway Companies have been invested by law and for the benefit of the public with a practical monopoly (at least so far as inland towns are concerned) of the carriage of all goods, they are bound to take into account the interest of the public in fixing their rates. Hence, if a rate of 10*s.* and a rate of 20*s.* would pay the same dividend to the shareholders, the Railway Companies are bound to carry at the lower rate.

2. That the system of charging very low rates where any competition by sea is to be met, and very high rates where only land carriage is possible, is unjust, and contrary to the spirit of the Acts of Parliament under which railways take their powers, and that it is, in addition, permanently injurious to the Railway Companies themselves, as tending to check, in a very decided manner, the growth of all midland towns.

3. That the system of giving special rates to a firm that will guarantee a certain amount of traffic requires alteration, inasmuch at it gives to large and favoured firms exceptional advantages, which are contrary to the spirit of the Railway Acts; and that if it be allowable to make a reduction for a guaranteed traffic, that reduction should be publicly announced and made equally to any number of firms that would give collectively the same guarantee.

4. That the existing rates for hardware and general merchandise from Wolverhampton and the district are unfair and injurious to the trade of this neighbourhood. For example, the rate for nails to London is 25*s.*; to Glasgow, 30*s.*; to Aberdeen, 40*s.*, including in all cases collection and delivery. Of course, the cost of collection and delivery may be taken to be nearly the same for a short journey as for a long one, and so also the cost of station-room, clerks &c. But if these items be taken at 5*s.* per ton, which appears to be a sufficient estimate, then the station to station rate will be 20*s.* to London, 124 miles; 25*s.* to Glasgow, 280 miles; and 35*s.* to Aberdeen, 430 miles; or, in the first case, 2*d.*; in the second, 1½*d.*; in the third, less than ¾*d.* per ton per mile.

The rate for hardware from London to Wolverhampton is 30*s.*; to Liverpool, 35*s.*; to Glasgow, 45*s.*; and to Aberdeen, 40*s.*, including the usual collection and delivery. In other words, if we make the same allowance as above for dead charges, the rate to Wolverhampton is 2½*d.*; to Liverpool, 1¾*d.*; to Glasgow, 1½*d.*; and to Aberdeen, scarcely more than ¾*d.* per ton per mile.

Again, the rate for nails from Wolverhampton to London is 25*s.*; from London to Hull, twice the distance, it is 27*s.* 6*d.* For hardware from Wolverhampton to London, we pay 30*s.*; from London to Hull, the rate is 38*s.* 4*d.* For what are called "smalls" we pay 1*s.* 6*d.* per cwt. and the Hull merchants only 2*s.*

Again, the rates from Wolverhampton to Hull for hardware is 22*s.* 6*d.*; and from Wolverhampton to London, 30*s.*; or, if we make the same allowance as before for the standing charges, the cost of the freight alone is 17*s.* 6*d.* to Hull, and 25*s.* to London for the same distance. In the one case about 1¾*d.*, in the other nearly 2½*d.* per ton per mile.

It is clear also that the difference in rates for long and short journeys does not arise from the fact that it makes little difference, when once loaded, whether a ton of goods goes another 20 or 50 miles or not. For if this were the case, the rates between Wolverhampton and London, and those between Birmingham and London, would differ by an infinitesimal amount, whereas, in fact, there is a difference on hardware of 3*s.* 4*d.* for the 12 miles.

It would be easy to multiply instances, but these are sufficient to show that there exist very great irregularities and inequalities in the rates charged.

5. That the fair way of making all these rates would be to fix a proper and sufficient charge for all the expenses which attach equally to long and short journeys, and a mileage rate for the conveyance of goods from station to station, which for the same classes of goods, should always be the same.

6. That if such a system be found for the present impracticable or difficult of adoption, the merchants and manufacturers of Wolverhampton conceive that they may fairly demand such an immediate revision of rates as will, at least, redress the more serious overcharges on their goods.

7. That unless some such reduction as has been suggested be made, it will be the interest and the duty of the traders of this district to support in Parliament, and by a guarantee

Mr. E. J. Gibbs. 14 Dec. 1865.

of traffic, any proposed Railway or Canal Company which is willing to adopt a sufficiently low mileage rate, and a sufficiently low and distinct system of terminal and other dead charges.

8. That these resolutions be open for signature, both by members of the Chamber and by other merchants and manufacturers of the town, and that a copy be forwarded to the Chairmen of the London and North-western, the Great Western, and the Midland Railway Companies, and of the Birmingham, Grand Junction, and Bridgewater Canal Companies; to the Chairman of the South Staffordshire Iron Trade, and to the Chambers of Commerce of Birmingham, Sheffield, Leeds, Nottingham, and Bradford.

10,749. Do you commence with a statement in that paper as to the inequality of the rates charged upon hardware and general merchandise?—Yes; the rates have been given to us by the representatives of the railway companies and their agents, and they appear to us to be unequal.

10,750. I find it stated in this paper that the rate for nails to London is 25*s.*; to Glasgow, 30*s.*; to Aberdeen, 40*s.*, including in all cases collection and delivery. Do you confirm that?—That is true.

10,751. I think you calculate that if the cost of collection and delivery, and also the cost of station-room, clerks, and so forth, be taken at 5*s.* a ton, the station to station rate will be 20*s.* to London, 25*s.* to Glasgow, and 35*s.* to Aberdeen, which makes in the first case 2*d.*, in the second case 1½*d.*, and in the third, less than ⅞ths of a penny per ton per mile?—Yes, precisely so; that is the calculation.

10,752. That has been worked out from statements made to you by persons actually concerned in business?—Yes; persons in the trade.

10,753. (*Sir R. Hill.*) Would not the 5*s.*, if sufficient for a provincial town, be insufficient for London?—It is possible that it might be insufficient for London.

10,754. The distances being so much greater in London than they are in provincial towns?—Yes; but at the same time I think that the distances to which the delivery is given are defined in London; it is not all over London that the delivery is given, but within a certain limited radius.

10,755. No doubt there is a limit, but it is a very extended limit, so as practically, I believe, to include the whole of London and Southwark also?—It does not include Deptford; I believe that the limits are about four miles.

10,756. (*Chairman.*) Taking hardware, do I understand you to state that the rate for hardware from London to Wolverhampton is 30*s.*; to Liverpool, 35*s.*; to Glasgow, 45*s.*; to Aberdeen, 40*s.*, including the usual collection and delivery?—Precisely; those are the rates quoted.

10,757. And I think that your calculation is that, making the same allowance as before for dead charges, the rate to Wolverhampton is 2½*d.*, the rate to Liverpool, 1¾*d.*, the rate to Glasgow, 1½*d.*, and the rate to Aberdeen less than 1*d.* per ton per mile?—Precisely so.

10,758. Have you also a similar complaint to make with regard to the charge for nails?—Yes; from Wolverhampton to London the rate is 25*s.*; from London to Hull, 27*s.* 6*d.* The rate for hardware from Wolverhampton to London is 30*s.*; from London to Hull, 38*s.* 4*d.*; and for small parcels from Wolverhampton to London, 1*s.* 6*d.*, and from Hull to London 2*s.* per cwt.

10,759. In short, speaking generally in the case of all that kind of traffic in which you are most interested, there is no proportion between the charge made and the distance travelled?—That is our complaint.

10,760. Are we to understand that it is contended by the Chamber of Commerce that a uniform mileage rate from station to station ought to be established upon all lines?—That was the resolution passed by the Chamber.

10,761. Do they consider that it would be fair that the same rate should be charged upon a line which was doing a very great traffic, and upon a line, which, from the nature of the country, was doing a comparatively small business?—I think that that is the effect of the resolution that they passed.

10,762. I understand that you are here to support that resolution?—I am not inclined myself absolutely to think that we could, with justice, expect an absolutely uniform rate in all cases, but at all events we could expect a very much smaller margin between the minimum and the maximum rate than at present exists.

10,763. All I wish to learn from you is, what is the system which you desire to see the railway companies adopt; you disclaim the idea of an absolutely uniform mileage rate upon all lines. According to the present system every company acts upon the purely commercial principle of charging as high a rate as it can within its Parliamentary maximum upon each line, irrespective of the charge which it may make upon other lines, and that is a system of which you complain?—That is so.

10,764. What is the third alternative which you wish the companies to adopt?—We think that they do not charge their rates on purely commercial principles, but that their maximum and minimum rates are made to support and counterbalance each other, because they are not in an exactly commercial position checked by competition, but have a monopoly granted to them by Government, which enables them, if they carry at a loss in one case, to make it up by carrying at an exorbitant profit in another.

10,765. You consider that, practically, they have a monopoly because, where only two or three companies at the utmost have entrance into a town, they have always the power, and they generally use it, of combining?—Precisely so. You can hardly find any case in which two or three railway companies go to the same place, without sooner or later making an arrangement as to the rates which they shall charge.

10,766. Then according to your view it comes to this, that the companies have it in their power to charge any rate that they think fit subject only to the Parliamentary limit?—I think they have.

10,767. And you contend that they could make it profitable to themselves to charge a lower rate?—We contend that if they can find it profitable to charge in one case ¾*d.* per ton per mile, the probability is that it will be profitable to them to charge in another case something less than 2½*d.* per ton per mile, the difference is so great.

10,768. You do not, I presume, complain of their reducing their charges below what is profitable to themselves, seeing that that is their loss and your gain?—We should complain of it if they carry at a loss, because we are quite certain that they will make it up by carrying at an excessive profit where they have an absolute monopoly.

10,769. But supposing that with a view of developing traffic which does not at present exist, a company consents to incur for two or three years a loss upon some portion of its line, do you think that that is objectionable?—The question supposes that it is to be only for two or three years and for the purpose of developing traffic which otherwise would not be developed—that is a different case from those in which the low rates are given. The traffic between Glasgow and London, or London and Aberdeen, or London and Hull, is not a traffic to be created by carrying at a loss.

10,770. Do you then contend that the companies are in the habit of carrying permanently at a loss?—No; we contend either that they carry at a loss when they carry at ¾*d.* per ton per mile, or that they carry at an excessive profit when they carry at 2½*d.* per ton per mile. We do not know which side of the alternative we should take.

10,771. (*Mr. Ayrton.*) May there not be a third case, namely, a very small profit?—We think that the difference on the face of it appears to be so great as that there would be no profit at all on the very low rate. That is what appears to us likely, comparing railway business with other business; because we hardly ever find any business in which the same goods can be supplied to derive any profit at all at one third

of the price at which they are supplied to other customers.

10,772. (*Chairman.*) I do not understand what it is that you consider to be the object of the railway companies in carrying for those long distances at a loss: you say that it is not with a view of developing a traffic which does not at present exist?—Looking at the cases in which the very low rates are given, it appears to us to be probable that the very low rates are given for the purpose of destroying the competition by sea; and that this is the only case in which low rates are ever given for a series of years.

10,773. But assuming that the competition by sea is destroyed, what is the gain to the company if, according to your theory, they are carrying at a loss, do you mean that the rates will be raised again after a certain time?—Not knowing the reasons that have dictated that policy we can only invent probable reasons. We find their policy to be always to carry at a rate about one-third of what they charge us, or at the most one-half of what they charge us, whenever they are met by competition by sea, and we find that they never give those low rates in any other cases. The only reason that we can imagine for such a course is that they wish to get the whole of the traffic which goes by sea into their own hands as they have already got nearly all the traffic that used to go by canals.

10,774. I understand you to say that competition as between one railway and another is no remedy, because they always combine?—Invariably, I believe. In all cases with which I am acquainted they have done so.

10,775. How is it that the same principle does not apply to competition between a railway company and a steam-boat company?—Because there is nothing to prevent a new steam-boat company being started to-morrow.

10,776. (*Mr. Ayrton.*) Then what is the use of reducing rates to get rid of steam-boat competition if a new steam-boat company may be started to-morrow, or the moment they raise the rates?—I do not think that the railway company are wise in doing it if they get no profit. I only say they do it. I do not think it is a wise policy myself.

10,777. Then it would rather lead to the assumption that they get some profit, though the profit is not so great as they would get in other cases?—I should not like myself to draw either of the two conclusions, because I do not know enough of the working of the case. We only say that you must take one conclusion or the other; either there is a small profit at seven-eighths of a penny per ton per mile, and then the profit appears to us to be excessive at 2½*d.*, or there is a loss, and then we think the policy is wrong.

10,778. (*Sir R. Hill.*) May we not safely assume that there is a profit derived by the company in conveying at that very low rate.—I do not see how I could assume that at all.

10,779. Does not the fact of its continuing year after year show that there is probably a profit?—I am not aware that it does.

10,780. (*Mr. Roebuck.*) You state that this inequality of rates is the result of a monopoly, and that that monopoly is the gift of the Government, meaning Parliament. Do you think that that is an accurate statement of the case; ought not you to say that the monopoly is the result of the state of circumstances over which Parliament has really no control?—I am not sure how far Parliament has control now, but I think it must be admitted that in granting the monopoly in the first instance Parliament had absolute control over the terms on which it should be granted.

10,781. Does Parliament grant a monopoly; does not Parliament simply grant the power of doing certain things?—Yes; Parliament grants powers which a railway company could not possibly have without it, and another railway company cannot be started in opposition without powers from Parliament.

10,782. Is not that because the state of circumstances is such as that a company could not run a road from one town to another without getting powers from Parliament to make it?—Precisely.

10,783. Then Parliament giving powers to one company, and another company asking for powers and having them granted to them, still you say that the mischief arises; then I ask you how you would prevent that combination, the result of which is this inequality of rate?—Whenever Parliament gives powers to a public company, or rather to a private company for public purposes, it is in the power of Parliament at the time that it gives those powers to insist upon such terms being affixed to the powers as will make the undertaking really what it professes to be, a benefit to the public.

10,784. I suppose that that is done by making a maximum rate, is it not?—It may be done in many ways.

10,785. How would you do it otherwise?—Does the honourable member mean to ask what are the kind of terms?

10,786. I ask you how would you prevent competition except by affixing a maximum rate?—I say that there is no competition; there is a monopoly granted by the public, and, in granting that monopoly, the public, I think, has the right, at all events in its original grant, to insist that it shall be for the benefit of the public.

10,787. You see that you are using words without really attaching any distinct meaning to them. When you say that it should be for the benefit of the public, how do you mean for the benefit of the public?—For instance, supposing you grant what I contend is a practical monopoly of the carriage of goods, I think that you have a right to require that the goods shall be carried at the lowest price consistent with a remunerative dividend to the shareholders.

10,788. Is not that always considered when a tariff is put into an Act of Parliament?—I dare say it is.

10,789. Then what more would you have done, would you merely lower the maximum?—We contend that the maximum, at all events, is so high as to allow of those very great inequalities.

10,790. Then is it your panacea that in future Acts of Parliament they should have a lower maximum?—Yes, and perhaps a minimum too.

10,791. Then your panacea is, that the restrictions should be less—that they should not charge so high as they now charge, and that they should not charge so low as they now charge, because that is the meaning of restricting: do you think that a remedy for the evil?—Speaking as the Secretary of the Chamber of Commerce, I have very distinct instructions to complain of the inequalities, and not myself to suggest remedies.

10,792. I do not ask you for remedies. You used a particular phrase—you said that a monopoly was granted by the Government. Monopoly means giving to one person; but very often three railways run to one town, and you say that it is still virtually a monopoly because they combine. I ask you, that being the case, what is to be done?—I say that I was particularly desired by the Chamber of Commerce to state the difficulties and grievances of which we complain, and not myself to suggest remedies to this Commission.

10,793. Still do you adhere to your statement that a monopoly is granted by Government, and is not the result of the state of circumstances under which the railways are made?—It appears to me to be so; that is my opinion.

10,794. You think it to be the result of the conduct of Parliament; that being your statement, I want to know if it is not a fair question to ask you what you would propose that Parliament should do?—That is coming back and asking my opinion, and I scarcely like to give it, acting as I do under the instructions of another body. I have an opinion of my own, but I am not appearing here in a personal capacity.

10,795. (*Mr. Ayrton.*) You have been good enough to hand in a paper containing this statement, "that "the fair way of making all these rates would be to

Mr E.J.Gibbs.
14 Dec. 1865.

"fix a proper and sufficient charge for all the expenses which attach equally to long and short journeys, and a mileage rate for the conveyance of goods from station to station," will you be good enough to explain to the Commission what is meant by fixing a mileage rate for the conveyance of goods from station to station, in what way is it to be fixed?—I should take the evidence of the railway companies themselves as to what the cost of conveyance was, and I would fix a minimum and a maximum rate, of which the minimum should be sufficiently above the absolute cost of carriage to give them some profit.

10,796. What do you say with regard to the maximum?—I am not prepared to state the exact principle upon which I should fix the maximum, but I do not think that there should be a very great margin between the two.

10,797. Then you would leave to the railway company unfettered discretion between the maximum and the minimum in the conduct of its business?—Yes, with one exception, mentioned in No. 3 of those resolutions. I would not allow the railway company to treat one firm differently from another.

10,798. Always assuming that the rates are the same under the same circumstances, would you allow a fluctuating scale for quantities large or small?—I do not see any objection to that myself on the ordinary principles of business.

10,799. Would you have only two rates for the smaller or the larger quantities, or would you have more than two rates?—I do not know. I would not give an opinion upon that.

10,800. (*Mr. Roebuck.*) What meaning do you attach to the words "fixing a proper and sufficient "charge for all the expenses?"—I mean to say that the railways should not charge more than a certain profit after they have paid the expenses for the rent of their stations, for their clerks, for the waggons, and for collection and delivery, and so forth.

10,801. Then you think that a parliamentary committee ought to estimate the expense of the line, and then to take into their consideration what fares would give a fair profit upon the expenditure so made?—If I were on the committee I think that I should take all that into account.

10,802. Do not committees take that into account?—I dare say they do.

10,803. Then what more would you do?—I would have them take it into account now with such facts as we have brought forward, now shown to them, making it evident that there is a very wide margin in practice, and I would require that margin to be reduced.

10,804. (*Mr. Ayrton.*) Does not the law at present give you the right of calling upon the railway company to make a rate from station to station, and does not it give you the right of collecting and delivering the goods yourself, quite apart from the railway company?—I do not know whether the law gives that right. We never do it. I have asked the railway company officials whether it could be done, and they have answered me that it was impossible.

10,805. Are they not bound to make you a separate rate if you choose to ask for it?—I am not sure about that; they tell me that it would be impossible to get the goods delivered in London by any other means than by having a single, or at most two agents.

10,806. Still if you choose to insist upon delivering the goods at the station, and taking them away from the station, is not the railway company bound to allow you to do that, and to make a rebate for the charges which it itself makes for collection and delivery?—I do not know whether it is bound to do it. I do not know the law upon the subject. They do make a rebate when we deliver at the station at our end.

10,807. How much do they rebate in that case?—1*s.* 6*d.* a ton.

10,808. Therefore whether you demand it or not they comply with the demand?—Precisely so.

10,809. And if you demanded it at the other end they would equally be bound to comply with it and to make a rebate, would they not?—I do not know. As a fact they do comply with it at one end, but we do not know whether they do that because they are bound to do it.

10,810. (*Sir R. Hill.*) But do there not still remain terminal charges of an indefinite character?—I do not think that any charges are of an indefinite character.

10,811. You have no means, have you, of knowing what is included under the head of terminal charges?—The public have no means of knowing.

10,812. If you were to take your goods to the station at the one end of the line, and take them away at the other end, the remaining charge would not be simply the mileage charge, would it?—No.

10,813. It would be the mileage charge plus two terminal charges of unknown amount, would it not?—An amount unknown to us.

10,814. (*Mr. Ayrton.*) You are aware, are you not, that the company in collecting and delivering goods are mere volunteers, and that they are not required to do so by their Acts of Parliament?—Probably not. I should think not.

10,815. Would you require them to undertake this duty, or would you leave the law as it is in that respect?—I do not make any suggestion about that. What we say and what we wish particularly to call the attention of the Commission to is, that put those dead charges and those charges which are incurred equally for long and short distances at what you may, there are yet very great inequalities. As for instance, if you collect a ton of hardware in London and take it to Liverpool and distribute it there, the distance is 200 miles; if you collect a ton of hardware in London, and take it to Wolverhampton and distribute it there, the distance is 123 miles. Now whatever the charges of collecting in London, and distributing in Liverpool and Wolverhampton may be, it is impossible to make it fair, or to make it equal, that the rate to Wolverhampton and the rate to Liverpool should be the same, which it is.

10,816. I am desirous of getting from you an exact definition of your proposal in the 5th clause. I want to know from you exactly the duties that are to be embraced in the station charge over and above the mileage rate. Whether those duties are to be confined to the mere, what I may call, shunting of the goods, and the unloading of them and the charge of the station, or whether the charge is to extend to delivery and collection, as the case may be?—I do not think that the resolution expresses any opinion upon that subject, but simply suggests that whatever the duties performed by the railway company in that way may be, they should be paid for properly, and that the mileage rate should be made more equal.

10,817. When you propose that they should fix "a "proper and sufficient charge for all the expenses "which attach equally to long and short journeys," do you mean the charge is to be confined to the duties which are incumbent upon the railway by law, or whether they are to extend to those which they now voluntarily undertake, and which they are not bound to undertake in collecting and receiving the goods?—I think that they should be properly paid for, whatever duties they perform.

10,818. How would you have Parliament fix a specific charge for a matter which the Act of Parliament in no way gives them power to do, or makes it incumbent upon them to do, and in which therefore they have no monopoly at all?—It is not an essential part of that 5th resolution, that the charge should be fixed by Parliament, but that the railway companies should fix it, and that we should understand it.

10,819. I only want to understand what the resolution means?—The resolution simply means this, that it is desirable and that it would be right that we should know exactly the duties that are performed by

the railway companies in addition to the haulage, and that we should know what is (and it is not impossible to calculate it) a fair charge for the performance of those duties, and that knowing that that charge should be made, so that we may distinguish the charge for haulage from the other charges that are made.

10,820. You mean that when the demand is made upon you it should be made in several separate items, one for the mileage, another for the terminal, and another for the collection and delivery if it is undertaken?—Not necessarily that the charge should be made to us in several separate items, but that at all events it should be published in separate items, so that we might know of what the different items consist.

10,821. You mean that when they give you the rates they should give them to you in separate items?—Yes, or when they publish them in their stations, for instance, they should give them in separate items.

10,822. Do you wish those rates fixed by law also in separate items, or not?—We do not express any opinion upon that. We simply say that it would be desirable that they should make the thing intelligible, but whether by law or by the action of the railway companies we do not say.

10,823. To fix without saying who is to fix, or when they are to be fixed, is hardly a definite idea?—We think it is the duty of the railway companies to fix them.

10,824. Are the Commissioners to understand that you confine your answer to that?—Simply to saying that it should be done.

10,825. You mean that the railway company should fix them, but whether any body should fix them upon the railway companies you are not prepared to say?—We simply say that it should be done. I am not prepared to say how.

10,826. (*Mr. Hamilton.*) Without committing yourself to saying whether the mileage rate should be uniform or not, I understand you, or the Chamber of Commerce which you represent, to desire that the mileage rate in all cases should be separately stated?—Yes; separately stated, not in all invoices, but in all tables.

10,827. (*Sir R. Hill.*) And you do not offer any opinion, as I understand you, as to whether those additional charges, usually called terminal charges, should be determined by Parliament when the Act is passed, or by any other tribunal which Parliament may institute for taking such matters into consideration from time to time?—My private opinion is that Parliament should fix the amount; but I am not instructed by the Chamber of Commerce to express for them any opinion.

10,828. (*Capt. Galton.*) Your main argument is that the rates require revision?—Yes.

10,829. Is it your view that probably they may have been proper rates according to the circumstances when they were fixed some 25 years ago, but that now circumstances have changed?—The rates of which we complain are almost all under, or at all events they are none of them above the rates that are to be charged by the railway companies. What we complain of is this, that whereas the railway companies find that they can carry at very much lower rates than were fixed by Parliament, they give the advantage of those lower rates in some cases, and withhold them in others; that they carry in one case 120 miles, and charge exactly the same as they do in another case where they carry 200 miles, both the rates not being above the maximum allowed by Parliament, but being in point of fact, as we say, unequal.

10,830. (*Mr. Roebuck.*) I do not want you to give any opinion as to what ought to be done.; but I want to learn whether you really understand the proposition that you have put down here in Resolution No. 5. You complain that there is one set of rates from inland towns to London we will say, and another from the seaports to London; the companies make different rates for those two different sets of circumstances. I suppose that they are enabled to do that by a tariff having a maximum, and necessarily having a minimum?—They have no minimum.

10,831. There is necessarily a minimum, because you can charge nothing, and that is a minimum. Is it not the case that the difference that they do make is the result of the tariff of charges fixed by the Act?—I think not.

10,832. Surely if a company charges, we will say 2*d.* a mile from Wolverhampton, and 1*d.* a mile from Liverpool (I am merely putting these as supposititious cases), they may do it by the Act of Parliament, and the powers given them by the Act of Parliament?—They are allowed to do it.

10,833. Then that is a consequence of the powers given to them by the Act of Parliament?—Yes.

10,834. When you say that they should make a "sufficient charge for all the expenses," how would you propose that that tariff should be so altered as to take away from the companies the power of making a different charge from one place to what they do from another?—The exact meaning of this clause of the resolution is that where the same work is done by a company the same price shall be paid for it.

10,835. Does not that resolve itself into a uniform charge?—Yes; over the same line of railway, that is the meaning of this fifth proposition.

10,836. Therefore the proposition of the Wolverhampton Chamber of Commerce is that there shall be a uniform charge?—That is the precise meaning of that proposition no doubt.

10,837. (*Mr. Ayrton.*) Would not the result of that be that there would be no power on the part of the railway company to reduce it?—I explained at the commencement of my evidence that perhaps that states it in a very broad way as a fair thing; but my own opinion is not so much that there should be an absolute uniform charge, as that there should be a very small margin between the highest and the lowest charge.

10,838. With a power to reduce it to a certain limited extent, instead of there being an indefinite power to reduce it to zero?—Precisely.

10,839. (*Sir R. Hill.*) Supposing that the maximum charges of all railways were reduced, then your object would be attained, would it not?—I do not think that our object would be attained, unless there were a certain limit given to both the maximum and the minimum.

10,840. The minimum is not fixed at all?—No.

10,841. Lowering the maximum would diminish the range which is all that I understand you to ask for?—No, it is not so.

10,842. (*Mr. Hamilton.*) In fact I gather it as your opinion that the traders have more interest almost in fixing the minimum than in fixing the maximum?—Almost as much, I think.

10,843. (*Mr. Glyn.*) You mean in certain places?—Yes, in certain places which are far removed from the sea-board.

10,844. (*Mr. Hamilton.*) Then these inequalities arise from the minimum not being fixed rather than from the maximum being too high?—I think quite as much from the one as the other. I should not like exactly to say which is the more potent cause; but I think that the inequalities arise quite as much from there being no minimum.

10,845. (*Sir R. Hill.*) In proposing a minimum to the charges of railway companies, you are expressing, are you not, your own private opinion?—Yes.

10,846. I see nothing in the resolutions of the Chamber of Commerce pointing to the imposition of a minimum charge?—No, there is not.

10,847. (*Capt. Galton.*) Have you considered whether the present classification of goods requires to be revised?—I am not prepared to give any evidence with regard to the classification of goods.

10,848. (*Chairman.*) Is there anything else that you wish to bring before the Commission?—I only wish to say this, that so far as we are able to judge, there appears to be only one principle in the charges

Mr. E. J. Gibbs.
14 Dec. 1865.

that are made, and that is low rates where competition, and above all where competition by sea is possible. But we want railways to give the lowest profitable rates of carriage where there is no competition. To do for us what the steamers do already and did before is not as much as we expect from them—we expect the railways, as they have considerable powers given to them by Parliament, to do for us by land what the steamers do by sea.

10,849. (*Mr. Ayrton.*) How can they do that?—By carrying at the lowest rate consistent with a profit.

10,850. The sea being a highway that costs nothing and the railway costing a great deal, how can they carry for you by land as cheaply as other people can carry by sea?—That is not my proposition; it is not that they should carry as cheaply as the steamers do, although in point of fact that is what they do, but that they should carry as cheaply as they can consistently with a profit, which is expressed in the first proposition of the resolutions, that if a high rate and a low rate would give the same profit to the shareholders, we think that it is the duty of the railway company to charge the low rate.

10,851. But a high rate and a low rate cannot give the same profit to the shareholders unless there is an extension of traffic equivalent to the reduction, can it?—Precisely so.

10,852. Is there any reason to suppose that the rates that are charged keep down the production of the country, and that there would be any increase in production in consequence of the reduction in the rates?—I think the probability is, that lower rates would decidedly increase the business of the railway companies.

10,853. I asked you as to the production of the whole country, not as to the production of a particular place, whether the production of the country is kept down at the present time by the high rates, and whether it would increase immediately or very shortly upon a reduction of rates, to such an extent as to compensate the railway companies?—The question, as it appears to me, for the railway companies is, not whether the whole production of the country would be increased, but whether the carriage upon the railways would be increased.

10,854. I ask you whether the production of the inland districts would be increased so much as to compensate the companies for a reduction of their rates?—I think it is probable that if the rates were reduced they would have more to carry.

10,855. (*Mr. Rocbuck.*) Let us take a particular instance. Supposing that the rate for carrying nails all over the country were lowered, do you think that more nails would be made and more nails carried than there are now?—I think it is extremely probable that more nails would be made and carried to London for export than are now made.

10,856. And you think that if that were extended generally to goods, there would be a great increase of production?—I think it is not at all improbable. It would assist us to the extent of the reduction in competing with foreign makers, and to that extent it is quite possible that there might be an increase of production.

10,857. It has been supposed that if the rate of carrying passengers were lowered, the number of passengers would be very much increased, and the same question about goods has been put, whether lowering the rates for carrying goods would increase the quantity of goods carried. Are we to understand it to be your opinion that lowering the rate of carriage would increase the quantity of goods carried so much as to make it equally profitable to carry at a low rate at a high rate?—I think it is extremely probable that it would be so, but I am giving only a probable opinion.

10,858. (*Mr. Glyn.*) But you confined that in your previous answer to the export trade, did you not?—I only mentioned the export trade as being that in which one can see in a moment that there might be an increase.

10,859. (*Mr. Ayrton.*) What per-centage of reduction do you think would have the effect of increasing your export trade from Wolverhampton?—I could not give an answer to that. An answer, if I gave it, to such a question as that, would not be worth anything.

10,860. It would enable anyone to form an opinion, if it were based upon some appreciation of the facts?—It would not, unless my answer had a good foundation for it, and it would have no foundation but guesswork.

10,861. You mean that the answer you have given is not founded upon any consideration of facts, but is a general proposition?—Yes. The first question asked me was a general question—Whether I thought that lower rates would enable us to make a larger production, and to that general question I gave the general answer, that I think it would; but now you ask me a particular question, What proportion of increase do I suppose would be the result, and to that I should certainly answer, that it would be impossible for anyone to say.

10,862. (*Sir R. Hill.*) Have you any doubt that the rates in reality may be so high as really to injure the profits of the railway company?—Yes, I think that they may be.

10,863. They may be too high even for a profit to the company itself?—Yes, it is conceivable.

10,864. On the other hand, I presume you would admit that they may be too low even for a profit?—Precisely.

10,865. And the question is, what point between very high and very low rates would produce the greatest profit?—Precisely.

10,866. But is it not your proposition that, seeing that the public has an interest in low rates rather than in high rates, you think that the companies should by some means or other be induced, or perhaps forced, to carry at the lowest rate that is consistent with present profit?—With a sufficient profit, that is the proposition.

10,867. Have you ever known an instance of a reduction in the price of any commodity, whether nails, or anything else, which has not been followed by an increase in the consumption?—It almost always is followed by an increase in the consumption.

10,868. Have you ever known a single exception to that rule?—I never have.

10,869. Do you believe that there ever was a single exception to that rule?—It could only be in the case of some commodity, the use of which was excessively limited. I believe, stating it broadly, that there never was an exception to it. For instance, look at the reduction in the rates for letters, that was a very great reduction, but in the end it paid.

10,870. (*Mr. Ayrton.*) When you use the phrase that rates may be too high for the profit of the railway company, do you mean that as a general opinion, or do you mean that they are too high, because it is a truism that they may be so, but do you mean that they are too high?—I do not mean to give an opinion upon that. The principal part of my evidence has been to show that there are inequalities, without giving an opinion as to whether 2*d.* per mile or ¾*d.* per mile is the right rate, but that the one or the other must be wrong.

See Memorandum subsequently furnished by the witness, Appendix BO.

The witness withdrew.

Adjourned to Tuesday, the 9th of January 1866.

Tuesday, 9th January 1866.

PRESENT:

The Hon. E. F. Leveson Gower, M.P.
Sir Rowland Hill, K.C.B., F.R.S.
J. A. Roebuck, Esq., M.P.
T. B. Horsfall, Esq., M.P.
Capt. Douglas Galton, R.E., C.B., F.R.S.
E. T. Hamilton, Esq., M.P.
J. R. M'Clean, Esq., (late Pres. Inst. C.E.)
William Pole, Esq., F.R.S., *Secretary.*

The Right Hon. THE EARL OF BELMORE in the Chair.

Mr. John Corbett examined.

Mr. J. Corbett.
9 Jan. 1866.

10,871. (*Chairman.*) I understand that you are the owner of the Stoke Works, near Bromsgrove, in Worcestershire?—Yes.

10,872. Are those works contiguous to any railway?—They are contiguous to two railways, the Great Western Railway and the Midland Railway.

10,873. I understand that you have a complaint to make that the charges are not in accordance with the distance?—Yes, in one case only. My works are situated 129 miles from London, and I pay 9*s.* per ton from Stoke Works to Camden Town.

10,874. Will you be kind enough to state of what description your works are?—Salt works; the Cheshire salt works at Winsford and Middlewich are 165½ miles from London, and the rate is 9*s.* 6*d.* per ton. That is the only case I have to state in regard to the rates not being in accordance with the distance, but to me it is rather an important one, inasmuch as the quantity I send is very large, being many thousand tons per annum.

10,875. (*Capt. Galton.*) I understand that you wish that the rate should be invariably a mileage rate according to distance; you state that you complain that the charge for 165 miles is only 9*s.* 6*d.* a ton, whilst the charge for 129 miles is 9*s.* a ton; do you wish your charge to London to be diminished, or the Winsford and London charge to be increased?—I think that mine ought to be diminished. I do not think it is fair for my works. Take, for example, the London trade. I do a very large portion of the London trade, perhaps 75 per cent. of it, and my competitors who are at a distance of 165 miles get to London within 6*d.* a ton the same as I do from Stoke Works to London, which is 129 miles.

10,876. Could they get your salt to London at that price by any other route?—No.

10,877. Not by sea?—Some little comes in by sea, but comparatively very little. It comes in by sea only in the shape of ballast when vessels are coming to London to load out for Calcutta or some other place.

10,878. Supposing that their rate was raised, would they then be enabled to compete by sea?—Yes, some would come in by sea then, but the rate, generally speaking, by sea, has very little to do with it. If a vessel is coming to London from Runcorn or from Liverpool for a cargo, she would have to take in ballast, and she would therefore, in that case, bring salt at a nominal charge.

10,879. Excepting under those circumstances, I presume they could not carry salt by sea?—Except under those circumstances London would be supplied by railway and by canal, not by sea.

10,880. (*Mr. Horsfall.*) Vessels do not very often go from Liverpool to London in ballast, do they?—Very seldom, but occasionally they do.

10,881. (*Mr. Roebuck.*) Could you tell me offhand, taking the 9*s.* charged to yourself and the 9*s.* 6*d.* to other salt works, what is the exact sum which you think you are overcharged?—The exact sum would be the difference of the rate between 165½ miles and 129 miles.

10,882. I am not able to make the calculation, but can you make the calculation so as to state the exact difference?—I have not done so, but I presume it would be something like 2*s.* to 2*s.* 6*d.* a ton.

10,883. (*Sir R. Hill.*) Does not that proceed upon the assumption that the whole charge is a mileage charge?—Yes, certainly.

10,884. Does not each of those charges include certain terminal expenses?—They are both alike in that respect.

10,885. But still a deduction must be made for the terminal charges, must it not, before you can get the mileage rate?—I do not know what terminal charges there can be upon an article like salt, because it is loaded into the trucks of the manufacturer at the works and is unloaded by him on its arrival in London, therefore any terminal charge must be nominal.

10,886. But in London it is not nominal?—I think so.

10,887. Does the charge to London include the delivery of the salt in London?—Not at all; it is merely from station to station.

10,888. (*Mr. Horsfall.*) You do not know at all what the terminal charge is?—I do not.

10,889. It may be 1*d.*, 3*d.*, or 1*s.* for what you know?—It may. I only know the charge from station to station.

10,890. (*Mr. M'Clean.*) What weight of salt do you send by railway?—I send into London about 24,000 tons per annum, and about 16,000 or 17,000 tons of it comes by railway, and the rest by canal.

10,891. How many salt vans do you employ for that purpose for the whole of that traffic?—I have about from 350 to 400 salt vans of my own.

10,892. You state in your preliminary statement that the waggons are much delayed by the various railway companies. What is the estimate of the loss that you annually sustain by demurrage?—Speaking from a rough estimate, the loss to me is something like from 700*l.* to 1,000*l.* per annum on the 400 waggons.

10,893. To what cause do you attribute the great detention of the vans, amounting, as you say, to 50 per cent. over a period of seven years?—It arises from divers causes; in many cases it is from delays at junctions, in other cases from the want of sufficient locomotive power I presume on the part of the railway companies, and another reason I presume is, that the railway companies are not responsible for demurrage on the trucks of the traders, and they give the preference to the trucks of each other, they being responsible for demurrage to each other.

10,894. Do the railway companies give any preference as regards transit to their own waggons over the owners' waggons?—I believe they do.

10,895. Can you state any facts in support of that statement?—Yes; I have not come prepared to give the dates or the exact names, but I have sent my inspector from time to time to see to the forwarding of the vans when they have been delayed, and I have found that the trucks belonging to the railway companies have had a preference given to them.

10,896. Have you any remedy to suggest with a view to the better working of the owners' waggons?—There would be two or three ways of doing it; one would be for the railway companies to find rolling stock for the manufacturers; the other would be to admit them to the clearing house under the ordinary clearing house regulations; and another would be for the receiving railway company to be responsible for the due forwarding and return of the vans or trucks according to the time allowed at the clearing house as between railway companies.

10,897. You think that railway companies should either treat owners' waggons as their own or else

Mr. J. Corbett. Jan. 1866.

provide waggons for their customers?—I do, most certainly.

10,898. And would you be prepared to pay the charges for demurrage and delay at stations in case the railway companies provided waggons for your trade?—I would; or what would be better would be to charge the demurrage or siding room to the consignees.

10,899. Would not it be contended that the railway companies cannot mix up their accounts in that way?—It would be almost impracticable for traders to enforce demurrage or siding room, for this reason: the state of competition existing between the different traders, whether you take salt manufacturers or coal proprietors, is such, that if one enforces the demurrage, it is very likely another would not, in order to get away the connexion of the one who did do so; but if the railway companies, being independent between the public and such traders on the railways, were to enforce it, there is no doubt it could be done very readily, and the evil would eventually cure itself.

10,900. Do you get through rates to all the stations to which you send salt?—I do not.

10,901. Have you any statement to make upon that subject?—Only so far as this, that through rates would be a very great convenience to the manufacturers and save them a great deal of trouble, and I think in many cases would be the means of extending the trade, particularly to places where salt or mineral articles are sent for exportation; take, for example, Hull, or Gloucester, or Bristol, or any large export town.

10,902. You think that a uniform rate on all lines for the same article would be advantageous?—I think some exceptions may arise on certain small railways, but I think it would be a matter very easily arranged; it is merely a matter for arrangement.

10,903. Where companies do not give through rates have you to send declarations to each junction?—We have.

10,904. Does that create considerable delay?—It very often does, and inconvenience also.

10,905. (*Chairman.*) I understand you to say that serious loss has been occasioned to you by the mixed gauge, particularly at Gloucester and Bristol?—Yes.

10,906. That loss arises, does it not, from the necessity of unloading your own waggons on the narrow gauge into the broad gauge waggons of the Great Western?—It arises from the broad gauge railways not having sufficient broad gauge waggons to receive the interchange of the traffic on arrival; it arises generally from the want of sufficient rolling stock to accommodate the traffic. I have given some cases in a tabular statement of the number of days that the waggons have been detained.

10,907. Before you give in that statement, I will ask you this, do I rightly understand that at your works at Bromsgrove your salt is loaded invariably into narrow gauge waggons?—That is so; it is entirely a narrow gauge line.

10,908. Therefore, when those cases occur, it is when you want to send salt beyond Gloucester or Bristol over the broad gauge system?—Exactly.

10,909. (*Capt. Galton.*) Are the waggons in which the salt is loaded at Stoke your own waggons or the Company's waggons?—They are sometimes my own waggons and sometimes the waggons of the Midland Company.

10,910. Do you find your rolling stock for the Midland Company or for only the other railways?—I find my own rolling stock for all the railways with the exception of what goes to Gloucester and Bristol, and that exception arises from the fact of the Midland Railway Company having a much larger traffic from Gloucester and Bristol upwards than they have down, and therefore, rather than send their trucks down empty to Gloucester and Bristol they say, We will take your salt. But I have at the present time a very awkward case of demurrage on their trucks. For example, they send their trucks to Gloucester, and they send their trucks to Bristol, the Great Western Company, or the Bristol and Exeter Company, as the case may be, have no broad gauge trucks to receive the freights, and they may be there for different periods from four days up to fourteen or fifteen days waiting for broad gauge trucks, and then it is not only a loss from the goods becoming damaged by being detained so long, but the Midland Company send me in a bill for the demurrage of their trucks, inasmuch as there is no clearing house system between the broad gauge and the narrow gauge. I sent the Great Western Company my account for the demurrage, but they repudiated their liability altogether, and I have never yet tried the matter.

10,911. On the narrow gauge lines you have trucks of your own, but on the broad gauge lines the trucks are found entirely, are they not, by the broad gauge companies?—Exactly so.

10,912. Would it be worth your while to have trucks on the broad gauge lines?—It would not, because the broad gauge forms so small a portion of the railway system, and as the broad gauge has not come to Stoke works and is not nearer than Bristol or Gloucester, you would never see your own trucks and could not repair them and it would be very disadvantageous altogether. I do not think it would answer the purpose of any freighter in our district to have his own trucks on the broad gauge.

10,913. (*Chairman.*) Still as I understand you, when you make use of the broad gauge trucks of the Great Western Company you do not use your own trucks to send your salt to Bristol or Gloucester, but you use the Midland trucks in that case?—Exactly.

10,914. So that when this delay and this demurrage is occasioned it is not when you are using your own trucks but the Midland Company's trucks?—It is in using the trucks of the Midland Company, when they will find them, they generally find them but not always, and then they hold the manufacturer responsible for the demurrage.

10,915. (*Capt. Galton.*) This inconvenience occurs, does it not, in consequence of the break of gauge?—Yes; it occurs in consequence of the break of gauge.

10,916. If there were no break of gauge, then that question could not possibly arise?—It could not possibly arise, because we should send our own trucks through.

10,917. (*Mr. Roebuck.*) I understand that the narrow gauge does not follow the broad gauge throughout the whole system?—No.

10,918. Taking the distance from your works to London, where does that break occur?—There is no break of gauge from our works to London. I am speaking of Gloucester and Bristol.

10,919. Then the narrow gauge attends the broad gauge, does it not, all the way to London?—No; it is narrow gauge only from my works to London, *viâ* Birmingham.

10,920. (*Capt. Galton.*) And *viâ* Oxford?—And *viâ* Oxford to Paddington.

10,921. (*Chairman.*) The narrow gauge exists on the Great Western Railway from Birmingham to London, but not from London in the direction of Bath and Bristol?—No; not west; you get the broad gauge from Gloucester and from Bristol, if I mistake not, to Swindon, or rather to Didcot, and then you get the mixed gauge to London, the broad and the narrow.

10,922. (*Mr. Hamilton.*) Are the Commission to understand from the first paragraph in your preliminary statement that you would think it an important improvement upon the present system, if the charges were made more in accordance with distance?—I think so.

10,923. What advantage would you derive from the rates being so charged?—I should derive the advantage of the difference between 165 miles and 129 miles; that is to say, my freight to London would be so much less, and instead of my competitors in Cheshire being armed with a comparatively low rate according to distance as compared with mine, I should have as low

rates in proportion to London as they, and the same thing would be in their favour in other parts of the country.

10,924. But do not the Cheshire Salt Works send their salt by a cheap conveyance to the River Mersey, and from Liverpool by vessel to all places round the coast?—Yes, they do.

10,925. If the rates were charged according to distance, would you be enabled to compete with the Cheshire Salt Works to towns on the south coast, such as Dover, Margate, Ramsgate, Hastings, Portsmouth?—Yes; if they were charged according to distance.

10,926. Is it not the fact that the railway companies now charge your salt lower mileage rates to those places than to places inland in order to enable you to compete with the Cheshire salt carried coastwise?—If the honourable member means that they charge lower at Bristol or Gloucester than they do to places inland, they do in some cases.

10,927. If you had a uniform mileage rate, you would lose that advantage, would you not?—I think not, because no salt from Cheshire goes by rail to those places on the south coast. We only have to compete with Cheshire salt by sea to places on the south coast.

10,928. (*Capt. Galton.*) What is the charge from Stoke, say to Plymouth or Devonport; is it equal to the London rate?—It is rather more, I think, than the London rate; I am not quite sure; I did not come prepared with all the different rates, although I could have done so.

10,929. Do you recollect what is the rate to Bristol?—The rate from Stoke to Bristol is about 5*s.* by railway; that includes trucks on the Midland line.

10,930. If you found your own trucks what would it be?—The same.

10,931. Do they make no difference when that is the case?—They make no difference, because, as I have stated before, they have an excess of traffic up, compared with what they have down, and therefore if you were to send it in your own trucks the railway company would have to bring those of the traders back empty, and therefore they prefer taking it in their own trucks when they can. The railway company finding trucks applies to the Gloucester and Bristol traffic only.

10,932. (*Mr. Hamilton.*) Would not the effect of the railway companies charging a uniform mileage rate be to give to the Worcestershire salt works the monopoly of the supply of salt to Staffordshire, Derbyshire, London, and the counties in the South Midland District, and to the Cheshire salt the monopoly of the north and north east districts, and a considerable portion of the south coast? No, I think not a monopoly; it would, according to distance, give them respectively certain advantages in certain districts, and naturally so.

10,933. If the railway companies were to charge all salt according to distance, would the public have to pay more or less for the salt in the districts in which the Cheshire and Worcestershire salt compete?—I do not think that there would be much difference.

10,934. (*Capt. Galton.*) Is not the charge for salt pretty nearly uniform over the country?—No; it differs of course according to the cost of freight from the works to its destination.

10,935. For instance, in the most distant markets in England in which it is sold, what would be the difference compared with the price in Birmingham?—We will take an extreme point, say Norwich; the difference would be perhaps about 9*s.* or 10*s.* a ton only; say 10*s.*

10,936. And that would be made up entirely of the carriage?—Yes, entirely of the carriage.

10,937. (*Mr. Hamilton.*) Do you complain of the rate of 9*s.* per ton for salt from Stoke to London?—No, I do not think it is an exorbitant rate, but I complain that it is a higher rate than it ought to be according to the distance.

10,938. (*Mr. Horsfall.*) You complain that the rates are unequal?—Yes, that the rates are unequal.

10,939. (*Mr. Hamilton.*) You say that the rate for salt from Winsford to London, which is a distance of 165 miles, is 9*s.* 6*d.* per ton?—Yes, or about that.

10,940. Are you satisfied that your information is correct?—My information comes from the manufacturers themselves, who pay the rate direct.

10,941. Would you be disposed to doubt the fact if you were told that it is 10*s.* 6*d.* per ton?—Except it came from authority I should.

10,942. But you do not give your information upon authority?—I get my information from the manufacturers.

10,943. Not from inquiry at the railways?—No, from the people who pay the money.

10,944. (*Chairman.*) Can you state off hand the rate per ton per mile which those two sums which you have given would amount to in each case?—In my case it amounts to about $\frac{3}{4}$*d.* per ton per mile; but in the other case to $\frac{1}{2}$*d.* and a fraction.

10,945. (*Mr. Gower.*) How do you account for this difference in the rate charged?—I can only account for it by the Winsford Works being altogether upon the London and North-western Railway, and I suppose that they think it expedient to give perhaps a little lower rate to works that are on their own line. My works are on the Midland and London and North-western. I pass over the Midland line 17 miles, and I pass over the London and North-western line 112 miles.

10,946. (*Mr. M'Clean.*) Do you get a through rate?—Yes, I get a through rate.

10,947. (*Capt. Galton.*) Do you take no salt to London by way of the Great Western line?—None whatever; they only go to Paddington, which is a very bad part of the town and involves a long cartage.

10,948. Do you take any by way of Reading?—Yes, by way of Reading to the Bricklayers' Arms Station.

10,949. Is that for shipping?—No, that is for the town of London.

10,950. That is for the south side of London?—Yes.

10,951. What rate do you pay for that?—That, I believe, is a lower rate than the rate the other way, but it is rather circuitous and the trucks are longer in performing the journey. I believe it is about a few pence less than if it goes to Camden.

10,952. Is it better worth your while to send it by way of the London and North-western line because the trucks are a shorter time away?—Yes, and it is better to send by two or three railways, particularly if the termini of those railways are situated in different parts of the town. For example, the South Eastern does very well for the south side of London and the London and North-western does very well for the neighbourhood of Camden Town and about there; that is one reason, you save in the cartage.

10,953. Does the rate which you quote include any cartage at all?—None whatever, nor any labour whatever.

10,954. Who unloads your salt?—My own agents in London.

10,955. At the railway terminus?—Yes, at the railway terminus.

10,956. And then your agents cart it, do they, over London?—Yes.

10,957. Then there is no terminal charge at all for your salt?—None whatever.

10,958. It is a mere mileage rate?—It is a mere mileage rate; at least there is no terminal charge that I know of. If any terminal charge is included in the 9*s.* it is only known to the railway company; but all that I know is that they take no trouble with the salt; it is put on to their locomotive; it is taken into the siding, and it is unloaded by my men, and as soon as the truck is empty it is taken back.

10,959. (*Mr. Horsfall.*) You do not know that they do not make a terminal charge. Take, for instance, coal.

Mr. J. Corbett.

9 Jan. 1866.

There is no trouble in discharging coal, and yet they make a terminal charge ?—I do not know, but I am at a loss to know what the terminal charge would be for ; they do no service for it.

10,960. (*Capt. Galton.*) Have you any foreign trade in salt ?—Yes, I have a large foreign trade to the Baltic.

10,961. Where do you ship from ?—From Gloucester and Bristol.

10,962. Do not you ship from London ?—No.

10,963. Then have you no shipping rate to the port of London ?—Yes, I have a shipping rate to London, and that is something less than the rate to Camden. There is a drawback upon the shipping salt on the production of the bills of lading, or of the captain's certificate that the salt is going to a certain foreign part.

10,964. Do you know what is the reason of that drawback ?—The reason of that drawback is to encourage the shipping trade from London as against Liverpool.

10,965. (*Mr. Hamilton.*) In fact the reduced rate is given you to enable you to ship salt in competition with the Cheshire salt sent from the Mersey ?—Yes, exactly so.

10,966. If a uniform mileage rate were charged, would not that shipping rate to London, to a considerable extent, be stopped ; would not your reduced shipping rate be done away with ?—I think not. I could not object to a shipping rate being granted to the Cheshire people.

10,967. But that would be inconsistent with a uniform mileage rate, would it not ?—Not at all. If a mileage rate were given from Cheshire to London, amounting to so much, and from Stoke works to London, amounting to so much, with an equal drawback upon both for shipping salt, I could not complain.

10,968. But why should the railway company, except for the purpose of encouraging trade from a particular district, give a lower rate in consequence of the peculiar destination of the goods ; why should they give you a lower rate because you are going to ship salt than they would give you if you are going to sell it in London ?—To encourage the export trade.

10,969. (*Mr. M'Clean.*) The railway company gets more money, does it not, by sending to London than by sending to Liverpool ?—Yes ; we do not send to Liverpool at all by rail.

10,970. (*Capt. Galton.*) Do you think it a legitimate mode of charging the rates that the railway company should take into consideration the prices at which an article can be sold at the place at which it is being delivered ?—I think so, because it does not always have reference to any competition in this country ; but in many cases we have to compete with salt manufacturers in a foreign country, and therefore our foreign trade in a great measure would be cut off if we could not deliver it at certain ports as cheaply as the foreign manufactured salts.

10,971. If that is the case, does not the same argument apply to towns in England ?—Certainly.

10,972. Is not it rather against your argument for a uniform mileage rate that it is advantageous to the trade of the country that in the price charged for the carriage a consideration should be given to the price at which the article can be sold in the town at which it is being delivered ?—No, I do not think so, if we are both charged equally.

10,973. Do you mean equal rates or equal sums for the total carriage ?—Equal mileage rates.

10,974. (*Mr. Hamilton.*) Is it not rather inconsistent on your part to ask for a uniform mileage rate which would give you the preference as to the supply of the inland towns as against the Cheshire works in the southern parts of the country, and then to ask for an exception to that uniform mileage rate in order to give you another advantage for shipping purposes ? —I am not asking for any advantage for shipping purposes ; I am merely stating what has been existing for some time, and I believe the same thing has been in existence on other railways, not only with regard to salt, but with regard to many other articles of exportation.

10,975. (*Mr. M'Clean.*) Articles that are required for ballast ?—Yes, that are required for ballast in many cases.

10,976. (*Mr. Hamilton.*) It would appear that under the present system the salt works in your neighbourhood have very nearly the monopoly of the London market, is not that the case ?—I do not know whether you may call it a monopoly ; the Cheshire people have equal access to London and the same rates, notwithstanding their longer distances.

10,977. But did you not just now state the proportion to be 75 per cent. ?—Yes, I suppose it is so ; that is to say, Worcestershire does 75 per cent. of the London trade.

10,978. Then the discrepancy in the rates does not inflict any very great damage upon the trade of Worcestershire ?—It sometimes renders the trade of Worcestershire nearly profitless by competition, that is all ; in fact it sometimes renders it quite profitless.

10,979. Would not the effect of a uniform mileage rate be to drive the Cheshire salt out of the London market ?—Not altogether. I think that the Cheshire works would do, perhaps, as much trade in London as they do now. I attribute the difference in the quantity done to my present agents and myself having been established in London for many years and making the London trade our special study, and opening establishments in different parts of the town, which the Cheshire manufacturers have never thought it worth their while to do ; Liverpool being their shipping port, they have never looked upon London as their port at all.

10,980. What would be the advantage to you if, under the uniform mileage rate which you think ought to be established, your competitors in Cheshire were to do the same proportion of the trade in London that they do now ?—The only way in which I should be prejudiced would be by their rendering the London trade less profitable, and sometimes, as I said before, entirely profitless. I have lost thousands a year in the London trade, in a fight of three or four years running, by the Cheshire people being admitted in at a low rate.

10,981. I understood you to say, that even if the mileage rate were uniform, you think that the Cheshire salt works would have the same proportion of the London trade that they have now ?—I think that they would have a certain proportion of it, and perhaps nearly as much as they have now.

10,982. Then what would you gain by a uniform mileage rate ?—I am not aware that I should gain anything particularly ; but you do not like to see works so much further distant from London bringing in salt at the same rate ; that is my only argument ; if you do not consider it a valid one I have nothing to say.

10,983. Is it not the case that a uniform mileage rate would probably drive the Cheshire salt entirely out of the market, and therefore give you virtually a monopoly of the trade?—No, I do not think it would, because the difference would be so small between the two ; even then, as I said before, they would do a portion of the London trade, and they always would.

10,984. (*Mr. M'Clean.*) Do they raise salt cheaper than you ?—Yes, I think they do ; their coal is cheaper.

10,985. And they are able to compete with you ?—Yes.

10,986. (*Mr. Horsfall.*) Have you ever made any complaint with regard to those unequal rates to the railway companies ?—I have.

10,987. What answer have they made to you ?—The answer has been very indefinite—the answer has been simply a refusal to make any alteration.

10,988. Have you any remedy to suggest when cases of difference arise between the railway companies and the public ?—The only remedy that I could

suggest would be some special court or some special tribunal before which the differences between the public and the railway companies should be brought and adjusted instead of the present uncertain and expensive mode of proceeding.

10,989. (*Mr. Roebuck.*) Do not you think that the differences may arise from these circumstances—supposing the more distant manufacturer says to the railway company, If we have an equal mileage rate we cannot trade say to London, but if you put us on a less mileage rate we can : it would be for the interest of the railway company to say, Very well, we can carry your goods with a profit at that less rate, and therefore we will charge you a less rate than if you were nearer ?—I certainly think so. I am not blaming the railway company.

10,990. If that is the case, if it benefits the manufacturer and benefits the railway company, how can it be considered a misfortune to the public ?—Perhaps in the general sense of the term it is not.

10,991. Then all that you seek is your own private and particular benefit at the expense of the public ?—I take the same view as the public. You must remember that the public is made up of manufacturers and traders, and I believe the general opinion is that there ought to be something like uniformity.

10,992. Will you mark the steps that I took in the questions which I put to you. I ask you if it is not for the benefit of the manufacturer, and you say it is ; I ask is it not for the benefit of the railway company, and you say it is ; and it is for the benefit of the public because they get a larger quantity of salt offered to them ; then all those three parties are benefited, and the only party not benefited is yourself ?—I am not so sure of that.

10,993. Have you not made those admissions to me as I went along ?—I may not look upon it exactly in the same way as you do.

10,994. I see that you do not look upon it in the same way that I do, because I am considering the public and you are considering yourself, but I have now brought you step by step to show that it is for the advantage of the public that that should be done, and I want to know why we or the Government should be called upon in any way to alter that state of things ?—I have always calculated that it was only a matter of equality between manufacturers that the railway companies should carry as nearly as may be at something like equal mileage rates. Of course it is for this Commission and for the Government to judge whether my opinion is right ; I only give my opinion of the state of the facts, and if you differ from me that is the natural consequence of looking at it from another point of view.

10,995. (*Mr. Hamilton.*) In your experience have you ever made an application to a railway company to quote you a special rate in order to enable you to compete with seaborne salt in towns on the south coast ?—I think it is very likely I have done so.

10,996. And has that explanation been entertained ?—I am not sure about its having been entertained, but I think I have made it, in fact I may say I have made such an application.

10,997. Do not you know whether your request has been acceded to or not ?—I know there has been some difficulty about it ; in many cases it has not been acceded to. I think perhaps in one or two cases of little importance, it has been met.

10,998. And I presume one of the arguments which you would make use of in making the application would be that the public would be benefited by the concession ? — No, I have not made use of that argument.

10,999. But that has been the result, has it not ?—It has been merely an attempt on the part of one manufacturer having his works on a railway to get a portion of the trade to a small town on the coast which had been supplied by sea borne salt ; it is merely a question of competition between one manufacturer and another situated in different parts of the country.

11,000. Then it appears to me that by your admissions you have shown that a variable rate is not only the most advantageous to the public but the most advantageous also to different manufacturers if not to an individual manufacturer, because a variable rate enables the Cheshire salt makers to compete with you in London and a variable rate enables you to compete with sea borne salt in the towns on the south coast of England ?—Just so.

11,001. Therefore we may assume, may we not, that that variable rate is for the interests of all parties?—I do not look upon it in that light.

11,002. (*Mr. M'Clean.*) When you speak of a uniform rate, do you object to special contracts being made by railway companies with manufacturers ?—Not at all, for quantity and distance, provided it is open to all others in the same way.

11,003. (*Mr. Gower.*) What distance do you send by canal in any direction ?—The longest distance that I send by canal is from Stoke Works to London, a distance of about 155 miles.

11,004. Is the charge the same by canal as by railway ? — The charge depends upon what part of London the salt goes to. If it is going into the Thames, perhaps it may be more convenient to send by canal ; if it is for the town of London it may be more convenient to send by railway, and the charges are much the same.

11,005. Is the canal which you send by in connexion with a railway ?—The canal is not the property of any railway company.

11,006. Is there an agreement as to rates between the canal and the railway company ?—I am not aware ; not as to salt, I think.

11,007. I suppose you would require the same reduction of rates by the canal as by railway, so as to put you on an equality with Cheshire ?—No, I do not think that the canals would be disposed to make any further reduction ; the canals have made several reductions within the last few years in order to compete with the railways, and I think it is very doubtful whether any further reduction could be made on the canals.

11,008. Then I suppose if a reduction were made on the railway and not on the canal you would entirely withdraw your traffic from the canal ?—Not entirely, because we should not be disposed to take our boats off the canal and put the salt all on the railway, because the canal traffic is useful for certain purposes.

11,009. (*Chairman.*) In fact, the canal traffic would, in some cases, save you the cost of cartage in London ?—It would when you are going alongside vessels in the Thames.

11,010. (*Capt. Galton.*) You have had great experience, have you not, in carriage by canal ?—Yes, I have had a good deal of experience.

11,011. Could you give the Commission an idea of what the cost per ton of conveying goods by canal is, exclusive of tolls ; you have several boats of your own, I think ?—Yes, I have many boats of my own. The tolls from Stoke Works to London by canal, speaking now from memory, but I shall be within a penny, perhaps, are about 4*s.* per ton, and I give to my steerers, I think, 5*s.* per ton.

11,012. Is that for the carriage and everything ?—For carriage and everything, with the exception of boat hire, which you may put at another 9*d.* per ton, or thereabouts.

11,013. That includes the horse and the haulage ?—Yes, everything.

11,014. 5*s.* 9*d.* a ton includes the whole cost of conveying the salt to London ?—Yes, besides the tolls.

11,015. I mean the expense of the haulage and of the boat ?—Yes.

r. J. Corbett. Jan. 1866.

11,016. (*Mr. M'Clean.*) Is that the long ton?—Yes, that would be the long ton; it would be, perhaps, what we call about 23 cwt. or 24 cwt. to the ton.

11,017. (*Capt. Galton.*) Then it would be less than that for the short ton, the railway ton?—Yes, a little less.

11,018. Could you work shorter distances as economically; for instance, if you were sending to Gloucester?—No; shorter distances could not be worked quite so economically, but if you wish for the comparative charge by canal and railway from Stoke Works to Gloucester, I may state that the charges are about the same as near as may be, and the same to Bristol by the Worcester and Birmingham canal and by the Severn.

11,019. (*Mr. Hamilton.*) But you have a toll-free river, have you not?—No, we have no toll-free river; the Severn has been made a navigation for some years now, and they charge tolls upon it.

11,020. Are the rates on the Severn the same as the canal rates?—I pay upon the Worcester and Birmingham canal from Stoke Works to Worcester 6*d.* per ton, and I believe I pay either 6*d.* or 8*d.* from Worcester on the Severn navigation to Gloucester; they are nearly equal.

11,021. Is the distance the same?—The distance by the Severn, perhaps, would be rather more than from Stoke Works to Worcester.

11,022. How much more?—Perhaps 10 or 15 miles more.

11,023. On a total distance of what?—On a total distance of about 37 miles or 38 miles. I am speaking now from memory, but I am within a mile or two.

11,024. (*Chairman.*) With reference to one of your former answers, I understand you have a tabulated statement which is intended to show that there is not only a great loss occasioned by delay in the delivery of the goods, but a loss by the delay of the trucks containing the goods?—Yes.

11,025. Will you be kind enough to put that table in?

The witness delivered in the following Table:

MEMORANDUM showing the average Time the Vans and Trucks are in Transit to and from Stoke Works and the following places for Six Months to December 1865.

Name of Place.	By which Route sent.	Miles from Stoke Works.	Days in Transit.	Time after allowing two Days for discharging.
Victoria Docks, London	Midland Railway to Birmingham 17 London and North-western to Camden 112 North London to Victoria Docks 9	138	4	2
Camden, London	Midland Railway to Birmingham 17 London and North-western to Camden 112	129	7	5
Bricklayers' Arms, London	Great Western Railway to Reading 94 South Eastern to Bricklayers' Arms 66	160	8	
Norwich	Midland Railway to Peterbro' 130 Great Eastern to Norwich 81	211	10	
Yarmouth	Midland to Peterbro' 130 Great Eastern to Yarmouth 100	230	9	
Hull	Midland to Normanton 121 North-eastern Railway to Hull 47	168	5	
Lincoln	Midland Railway 107	107	7	
Reading	Great Western, narrow gauge 94	94	9	
Brighton	Great Western to Reading 94 South-eastern to Redhill 46 London, Brighton, and South Coast to Brighton		11	
Canterbury	Great Western to Reading 94 South-eastern to Canterbury 106	200	10	
Portsmouth	Great Western to Basingstoke 118 London and South-western to Portsmouth 46	164	8½	

MEMORANDUM showing the Time Salt, forwarded from Stoke Works per Railway Companies Waggons, is in Transit to the under-mentioned Places *viâ* Gloucester and Bristol.

Name of Place.	Route sent.	Miles from Stoke Works	Days in Transit.
Salisbury	Midland Railway to Gloucester 35 Great Western Railway to Salisbury 93 The delay rests with the Great Western, not with the Midland	128	
Cirencester	Midland Railway to Gloucester 35 Great Western to Cirencester 18 The delay rests with the Great Western, not with the Midland	53	
Swindon	Midland Railway to Gloucester 35 Great Western Railway to Swindon 37 The delay rests with the Great Western, not with the Midland	72	
Exeter	Midland Railway to Bristol 72 Bristol and Exeter Railway to Exeter 75¼ The delay rests with the Bristol and Exeter Railway, not with the Midland	147¼	
Coal trucks to and from Stoke Works and Dudley district		25	
Do. do. Derbyshire do.		54	
These include the time in loading and unloading.			

11,026. (*Capt. Galton.*) Referring to this table of delays, do you consider two days a sufficient time for unloading?—Plenty.

11,027. Is more ever taken for unloading your trucks in London?—I should think sometimes more is taken, not only in London, but in other places. In many cases they are unloaded in one day, and I have taken the average, and I think two days a very fair allowance.

11,028. (*Mr. Hamilton.*) Do you receive any report from your consignees as to the promptness with which they take delivery of the cargoes consigned to them?—Yes, in London particularly.

11,029. And you feel that the excess of time is not due to any delay on the part of the consignees?—As a general rule, I do feel so.

11,030. But in this tabulated statement you have laid down the detention almost entirely to the charge of the railway company?—No, I think not.

11,031. You take in your last column two days as the time allowed for discharging, and I understand you to say that the difference between the whole time and those two days you take as the number of days occupied in the transit?—Yes, exactly.

11,032. But a great portion of that difference may arise from the delay of the consignees in unloading the goods sent to them, may it not?—I think not, as a rule; because, as I said before, many trucks are unloaded the first day because the parties are in want of the goods, but I have given them a very fair average. I think two days, on the whole, from my experience of some 15 or 20 years, is a very fair average.

11,033. Has it ever happened that railway companies have made complaints about the delays of consignees in taking delivery of the goods?—Not that I am aware of.

11,034.—They never have reached you?—Not to me; if it has been so they have the remedy in their own hands, by charging siding room to the consignees, and if they would enforce that, I think there is no proprietor of railway waggons but would readily concur in it.

11,035. (*Mr. M'Clean.*) Are you prepared to concur in it?—Yes.

11,036. (*Capt. Galton.*) Does this table show the time that the vans take to go and return to Stoke Works?—Yes.

11,037. It is the average between the particular places mentioned?—Yes, exactly so. This table was made up from what is called the van book, which is kept by a man whose duty it is, and who does scarcely anything else; he registers the vans as they go out, and he registers them as they come in.

11,038. Can you account at all for the reason why the average time of the waggons going to the Victoria Docks, a distance of 138 miles, is only two days, whereas going to Camden Town the average is five days for a distance of 129 miles?—No; I cannot

account for it, except that sometimes they get blocked in at Camden; and in the other cases they sometimes go right through, because they are in larger quantities going down for shipping order to the Victoria Docks.

11,039. Can you account for the length of time that the waggons seem to be going to Lincoln and back, namely, five days?—Not at all, with the exception that they get detained at Nottingham, where there are several junctions, and sometimes at Birmingham.

11,040. (*Mr. Hamilton.*) Let me call your attention to that table which you have handed in; you say that it takes from your works to Reading, nine days, or, allowing two days for discharging, seven days; if you carry your eye up to the third entry you will see that it is stated that it takes eight days to the Bricklayers' Arms, after passing through Reading?—No, that is not the same traffic; the one is to the town of Reading, and the other is passing through Reading *en route* to the Bricklayers' Arms.

11,041. Why should there be any railway delay with regard to the traffic in the town of Reading, if there is no railway delay in the passage through Reading to another place?—That I cannot explain. It often occurs in the case of the Great Western Railway Company, who are very short of locomotive power, that waggons are lying perhaps two or three days or longer than that, at Worcester, *en route* for Oxford, and they may lie again a day or two at Oxford before they get to Reading.

11,042. But surely that would apply to goods going beyond Reading to the Bricklayers' Arms, as much as to goods going to Reading as their destination?—It would, certainly. I can only say that this is taken out from my van book, and it is the average of six months working, and I thought that that was a very fair estimate.

11,043. In the same way in the last line, having shown that the total time in transit, after deducting the two days to Reading, is seven days, you show that for the traffic to Portsmouth, which is considerably beyond Reading, the time occupied is only $6\frac{1}{2}$ days?—Yes; but that goes over a different line of railway; it goes down the South-western.

11,044. It goes by the Great Western, does it not, to Basingstoke, which passes by Reading?—Yes; but it goes by the South-western to Portsmouth, and not by the South-eastern.

11,045. But there is the hitch at Reading, in that case also, is there not?—Yes, I believe that Reading is the great point of detention and always has been. I have, on special cases, sent a man from Stoke Works to Reading to ascertain the cause of the delay there, and it has arisen, in some cases, more particularly a year or two ago, from the South-eastern and the Great Western Companies not being on the best terms with each other, and the delay very often occurs from conflicting arrangements between railway companies.

11,046. That does not quite meet this case, because you show that in a case where a conflict between two railways cannot arise, that is to say, in the direct trade to Reading, the trade stopping at Reading, there is greater detention than in the trade which is shared between those two conflicting companies?—Just so; that appears to be the fact. There are certain comparative statements here, I have no doubt, which appear somewhat inconsistent with each other, but I can only state the fact as to the time when the vans go away and when they come back.

11,047. How were those tables prepared?—They were prepared from what we call the van register, which is kept by a man whose special duty it is to keep it. When the vans go out he enters them, and when they return he enters them. That, I believe, is the usual mode of keeping the register with every manufacturer who owns a large number of vans or trucks.

11,048. (*Capt. Galton.*) What remedy do you think could be applied in order to secure a more rapid return of the vans?—Better working arrangements between the railway companies, and making the railway companies responsible for their affording a return of the trucks within a reasonable time.

11,049. To make them pay, in fact, demurrage for the trucks which are not returned?—Exactly so. As a rule I do not complain of the railway companies, because, considering the power they have, I think they are very moderate, and I am often surprised at their moderation; but that is not a right state of things for the public. I believe that if the railway companies were responsible for the demurrage of the trucks of traders in the same way as they are responsible to each other for demurrage at the clearing house, the transmission, both outward and homeward, would be better than it is.

11,050. If the railway companies were compelled to find you the trucks for working your traffic, just as they find the locomotive engines, would they then, do you think, deliver the goods with greater speed?—I believe that they would.

11,051. You have no instances, have you, of cases where they are delivered more rapidly in the one case than in the other?—Yes, I have. Before I commenced finding my own railway trucks the Midland Railway Company, or the Oxford, Worcester, and Wolverhampton, as the case may be, found the trucks, and there was not the delay then that there is now; in fact the delay has increased, as I said in my preliminary statement, within the last seven years. It takes me at the present time nearly 50 per cent. more stock to move the same amount of traffic that it did seven years ago, clearly showing that either from excess of traffic or from other causes the evil has been increasing.

11,052. And that adds very considerably to your expenses?—Yes, it adds considerably to my expenses.

11,053. (*Mr. Hamilton.*) You only suggest that it arises from the want of locomotive power as a possible explanation, you do not know as a fact that it arises from the want of locomotive power?—I know it as a fact on the Great Western.

11,054. (*Mr. Gower.*) What is the longest detention that you have ever experienced?—I have had salt lying at Gloucester for as much as 17 or 18 days.

11,055. Was there any special circumstance to account for that delay in that instance?—The only special circumstance by which I can account for it would be the want of stock on the part of the Great Western Company to take it on; that is the reason which they themselves assign.

11,056. But that was a very unusual detention, I presume?—It was a very common one at one time; it sometimes lasted for months; railway companies generally give the preference to the forwarding of that traffic which is to them the most remunerative, and salt and coal and iron and different minerals being materials in a different classification, and consequently paying lower tolls, they give the preference to the higher classes of merchandise.

11,057. (*Chairman.*) In your preliminary statement you say that the law between the public and the railway companies is most unsatisfactory and requires some general revision, and you go on to make some further remarks, do you not?—Yes; I am not going into the details of the law with regard to railway companies, I am speaking of course in general terms with regard to the uncertainty and the indefinite state of the law. For example, when you complain to the railway companies of delay, some of them at least say, we are not bound to take your salt or to find trucks for your salt, and when you make claims upon them for delays, they plead non-liability. Then they have the power to vary their tolls from time to time, which appears to be by no fixed rule, except their own interest and convenience.

11,058. (*Mr. Roebuck.*) Do you think it would be an advantage if railways generally were subject to the Carriers Act and were made common carriers?—I do not think so in the present state of the traffic of

Mr. J. Corbett.

9 Jan. 1866.

the country; I think it would be next to impossible. I presume the honourable member means that the traders are to find their own locomotives?

11,059. I mean merely this, that they are to be subject to the same rules as a common carrier?—Yes, I do think so; I think that it would be an advantage.

11,060. At the present moment they can refuse to take any goods, can they not?—They can.

11,061. They can put what price they choose upon them, and they are not in any way compelled by law to give you any facilities when you arrive at the end of your journey at the terminus?—I am not sure about their power of putting any charge on, but I know that the maximum charges would be prohibitory, and that they can, if they please, refuse to take a certain class of traffic. For example, they may say to me, We do not carry salt, and we will not take your salt; or they may cease to carry it at any time they please.

11,062. We will suppose that there are three coal mines within a short distance of each other upon a particular line of railway; could not the railway company determine to take the coals of one mine and refuse to take the coals of the others?—I think not, if they are within three or four miles of each other, but I am not quite sure upon that point, I have never tried it; but they could not refuse to take the coals of one party from the same station if they carried for another.

11,063. Do you mean to say that, supposing you are working a coal mine not upon a railway, you could compel that railway to take your coal?—No; I could compel them if they carried coal from the same siding for one of my competitors.

11,064. (*Chairman.*) Could you compel them to carry it upon the same terms?—Yes.

11,065. They might charge you the maximum tolls might they not, if they thought fit?—Not if they charge lower tolls to our competitors, if the circumstances were the same, that is to say, with regard to quantity and distance. I have always considered that quantity and distance ought to form elements in the tolls charged.

11,066. You state that they could not refuse to carry for you if they were carrying for one of your competitors from the same siding. Supposing they were carrying for your competitors at a rate, say, of $\frac{1}{2}d.$ per ton per mile, could not they refuse to carry for you at the same rate, and might not they charge you their maximum rate if you forced them to send your trucks?—No; I apprehend that they could not refuse to carry for me at the same rate provided that I send the same quantity and for a similar distance, under like circumstances. But I have always looked upon what is called the Railway Clauses Consolidation Act as being intended to apply to a different state of things—a state of things which has never been called into operation—because the public under the Railway Clauses Consolidation Act would be their own carriers, which now would be impracticable.

11,067. Have you any other statement that you wish to make to the Commissioners?—There are just a few remarks that I have epitomised here in this paper before me. I say, first, that I would recommend a careful revision and amendment of the law; secondly, moderate maximum tolls on the different classifications of merchandise and minerals, the Board of Trade reserving to itself the power of revision, and the service for such tolls to be clearly defined; thirdly, through rates and unity of action in the interchange of traffic; fourthly, railway companies either to find rolling stock for manufacturers, or to admit the stock of manufacturers to the clearing house on the usual conditions as between railway companies; and, fifthly, some special court of appeal as between the public and railway companies, the decisions of which should be prompt and final.

11,068. (*Capt. Galton.*) You would require railway companies to give demurrage to the traders, would you not?—Yes.

11,069. If always your waggons were admitted to the clearing house you would then be able to get a return of your waggons with less delay, I presume?—Yes, exactly so; all the railway companies would then be responsible for the delay.

The witness delivered in the following statement upon the railway traffic to and from his works:

1st. That the charges are not in accordance with distance.

Salt from Stoke Works to London *vid* Birmingham, per Midland Railway, 17 miles, hence per London and North-western Railway to London, 112 miles; total distance 129 miles; charges 9*s.* per ton.

Salt from Winsford and Middlewich, Cheshire, to London, per London and North-western Railway, 165½ miles: charges 9*s.* 6*d.* per ton.

In both cases the railway waggons are found by the manufacturers, but the quantity sent from Worcestershire to London is very considerably in excess of that sent from Cheshire to London.

2nd. That serious delay occurs in the transmission of goods from place to place, owing to divers causes.

A tabulated statement herewith will show the average time occupied in the transit of salt vans to different towns and stations in England making an allowance of two days for unloading. It will be seen that in many cases it occupies nearly as many days which ought to be only hours. The causes of delay are various, such as conflicting arrangements of the different companies at the junctions of their respective lines; want of sufficient locomotive power to work the traffic, &c.

I forward a large portion of my traffic by water (the old system of canals), and it has frequently occurred that the traffic sent by water arrives sooner than that sent by railway to the same place.

3rd. Serious loss, occasioned by the mixed gauge, particularly at Gloucester and Bristol.

At Gloucester are the narrow gauge of the Midland and the broad gauge of the Great Western and South Wales Railways.

It frequently occurs that large quantities of my goods are kept at Gloucester waiting for the broad gauge trucks of the Great Western; periods from five to ten days, during which time the goods are materially damaged by exposure.

At Bristol the same thing occurs in goods going over the Bristol and Exeter Railway, but not to the same extent as Gloucester.

4th. That great hardship is inflicted on manufacturers and traders, who at great cost find their own railway plant (trucks and vans), by the serious detention which occurs at junctions and other places in transit over the different railways, and for which railway companies state they are not responsible

As a rule railway companies compel extensive salt and coal proprietors to find their own railway stock, but which stock they refuse to admit to the clearing house system, so that, however extensive the claim for demurrage may be against the railway companies, they refuse to allow it or make any compensation. At the present time it takes me 50 per cent. more stock to move the same amount of traffic it did seven years ago, so much has the evil of delay in transit increased.

On reference to the tabulated statement herewith, it will be seen that it is not only a question of loss by delay in delivery of the goods, but loss by delay of the trucks containing the goods, both of which may belong to the trader. As the railway stock of salt and coal proprietors and other traders of the United Kingdom form a most important item of value, it ought to be admitted to the clearing house, or the railway companies made responsible in some other way.

5th. That the present state of the law as between the public and railway companies is most unsatisfactory, and requires general revision and amendment.

It is scarcely necessary to state that at the time Acts of Parliament for the construction of many of our principal railways were obtained the practical application of the law as to their working was little understood. At the present time, in the majority of cases, it might be said, practically speaking, there is no law as between the public and railway companies, inasmuch as the means of evasion are so numerous and so easy that the former are left much at the mercy of the latter. It may not be out of place to cite one example of the powers assumed by a railway company some years ago, and the high handed manner in which they carried them out. These works are situated at the junction of the Midland Railway, and what was at that time the Oxford, Worcester, and Wolverhampton Railway. A dispute arose between the Oxford, Worcester, and Wolverhampton Railway Company and myself as to the tolls they

were by their Act entitled to charge over the branch railway leading to my works. I took counsel's opinion, who confirmed my views of the case. I offered to refer the matter in dispute, but such an amicable mode of settlement did not appear to meet the views of the railway company, and, much to my surprise, they one morning sent a body of men and took up the line, the rails of the permanent way, stopping the traffic to and from the works; they took the opportunity of doing this act at the time the canal was frozen over, so that I had no means of transit, either by rails or water. I could make no legal movement for some time, as it happened to be during the long vacation. I at last moved for a mandamus and took the case to the Court of Chancery; but so soon as they found I was not to be intimidated they gave way, and laid down the line of rails again.

Mr. J. Corbett.
9 Jan. 1866.

If I may be permitted to offer an opinion, it has often occurred to me that the present magnitude and national importance of railways demand some special tribunal or court of appeal for the adjustment of differences between the public and the railway companies. I feel strongly that such a court would give great satisfaction to the public.

The witness withdrew.

Adjourned to Thursday next, at 12 o'clock.

Thursday, 11th January 1866.

PRESENT:

THE HON. E. F. LEVESON GOWER, M.P.
CAPT. DOUGLAS GALTON, R.E., C.B., F.R.S.
J. R. M'CLEAN, ESQ., PRES. INST., C.E.
WILLIAM POLE, F.R.S., *Secretary.*

THE RIGHT HON. THE EARL OF BELMORE IN THE CHAIR.

[*There not being a quorum present, the following evidence was taken provisionally; it was accepted at the next official meeting of the Commission.*]

Mr. JOHN NURTHALL BROWN examined.

Mr. J. N. Brown.
11 Jan. 1866.

11,070. (*Chairman.*) I understand that you are the general manager of the Cannock Chase Colliery Company, and of the Lintz Colliery, and a director of the Gloucester Waggon Company, the Patent Shaft and Axletree Company, and of several other companies?—I am.

11,071. Were you formerly general manager of the South Staffordshire Railway?—I was.

11,072. Have you had much experience in the carrying out of traffic on canals and railways?—I have had 30 years experience.

11,073. What are the capabilities of your collieries—The collieries are equal to about 2,000 tons per day, or 12,000 tons per week.

11,074. What weight of coals do you send by railway?—About 5,000 tons per week.

11,075. (*Capt. Galton.*) How does the rest go?—By canal and land carriage.

11,076. (*Chairman.*) On what line of railway is your colliery?—On the South Staffordshire branch of the London and North-western railway.

11,077. Is your coal traffic worked satisfactorily?—No it is not, I am sorry to say.

11,078. In what respect do you find that it is not worked satisfactorily?—The delays are very serious; we never know when a waggon leaves the colliery when it is likely ever to get to its destination, much less to be returned again to the pits; in many cases it is away a fortnight or three weeks.

11,079. (*Capt. Galton.*) Do all the waggons belong to you?—No, we have upwards of 800 of our own, and there are 200 or 300 private traders' waggons in addition.

11,080. (*Chairman.*) Do you sustain a large annual loss by demurrage?—Yes; we do sustain a very large loss by the demurrage of the waggons, which I estimate at at least 3,000*l.*; then there is the loss in the traffic which we cannot calculate, and the damage done to the colliery in keeping the colliery standing for want of trucks.

11,081. (*Capt. Galton.*) Is that sum the amount of the demurrage per annum?—That is the actual cost of the waggons to us per annum; that is to say, the actual dead loss in waggon hire. Then, besides that, there is the loss in keeping the pits standing waiting for trucks, and the loss in trade and profit on the coal. We cannot estimate the damage done to the colliery when the waggons are kept away in that way; it is impossible to do it.

11,082. (*Chairman.*) Are we to understand that the loss which you sustain by demurrage is the sum that you have had to pay to the railway companies for waggons standing on the siding, or is it the loss that you sustain by not being able to use the waggons for the purposes of your trade?—If you take the value of the stock as being worth 70,000*l.*, it is the interest of that money, and the repairs added, less the amount the waggons actually earn.

11,083. (*Capt. Galton.*) Do you mean that if the waggons were returned to you as soon as they were unloaded, without delay, you then would be able to work with a less number of waggons, the difference between the number with which you work and the less number with which you might work being represented by a capital of which the interest is 3,000*l.* per annum?—Yes, precisely; for if you take it that a waggon costs a shilling a day, which is about the average including repairs, that is, 6*s.* per week, and if that truck is kept away three weeks instead of three days, that is 18*s.* on the cost of the waggon.

11,084. And it comes to this, that you must have so many more waggons to work the traffic?—Precisely. But the injury goes further than that, because we never know when we are sending a truck of coals away from the colliery what the waggon hire will cost. We calculate the charge to the customer at 1*s.* a ton, but in many cases it costs us 4*s.*, 5*s.*, and 6*s.* per ton, and instead of getting a profit of 1*s.* a ton on our coal, we are losing sometimes 5*s.* or 6*s.* This occurs when waggons are damaged and kept from home 1, 2, and 3 months.

11,085. How is the 1*s.* a day, the value of the waggon made up?—It is the interest of the money and the wear and tear and the repairs.

11,086. That is on the actual cost of the waggon?—On the cost of the waggon. Taking it that there are 300 working days, that gives 15*l.* per year for a 10 ton truck, and that includes maintenance, depreciation, and everything. There is always 5 to 10 per cent. of the waggons under repairs, so that we cannot get 300 working days on the average. When a waggon is at work it should earn at least 1*s.* per day to cover its cost.

11,087. What is the cost of the waggon?—The first cost would be 75*l.*

11,088. Upon that, of course, you charge interest at so much, say 5 per cent., and the depreciation?—Yes.

11,089. What would the rate of depreciation then be?—From 3*l.* to 4*l.* a year per waggon.

11,090. And the rest, I suppose, 6*l.* or 7*l.* a year, would go in maintenance?—Yes; a 10 ton waggon, if taken upon hire, including maintenance will cost 13*l.* per annum.

11,091. (*Chairman.*) You state that you charge your customers 1*s.* per ton for the waggon hire, but do you calculate that in those cases of demurrage you lose at the rate of 5*s.* per ton or 5*s.* per waggon?

Mr. J. N. Brown.

11 Jan. 1866.

—Per ton. In many cases the waggons have been kept away from the colliery for a month, and the worth of that waggon would be over 1*l.*

11,092. How many tons will a waggon hold?—Take it that it holds eight tons, that is 2*s.* 6*d.* a ton instead of 1*s.*

11,093. When you spoke of 5*s.* did you mean for each ton?—We have had waggons kept away from the colliery for three months. Supposing that a waggon is away a month, the cost of that waggon to us is 1*l.*; it takes away eight tons of coal, and therefore it costs 2*s.* 6*d.* per ton, and we charge our customer 1*s.* only, and we lose 1*s.* 6*d.* a ton. There is no law binding the railway company to carry those waggons within any given time, and the consequence is that mineral traffic and coal traffic is always put on one side for goods and other traffic where the company are subject to demurrage.

11,094. To what cause do you attribute the great detention of waggons?—To the want of locomotive power and station accommodation. The want of locomotive power, I think, is the great cause; as I have said before all the coal traffic is made to give way for a time for what we term clearing-house traffic, that is to say, waggons subject to the clearing-house regulations and subject to a demurrage of 3*s.* per day. They must travel a given number of miles, and there is only one day allowed for the transit of 120 miles, and for all above that the railway companies charge 3*s.* per day, and our waggons are put on one side, and they may stand there for a month with impunity. I have had numerous letters from various companies giving reasons why the waggons are not taken forward, and they all say that they are short of locomotive power, and that the trains have all been full. That excuse might answer very well for one day, but it should not go on for seven and even 10 days following. If the trains are full on one day, the new traffic next day ought to be made to give way for ours that arrives the day before; but that is not so, they keep on with the clearing-house traffic, and ours stand on one side till it is convenient for them to take it forward.

11,095. Do you find that railway companies give any preference to their own waggons over another company's waggons?—I do not think they do.

11,096. Do you find that railway companies give any preference to their own waggons over private owners' waggons?—Undoubtedly they do.

11,097. When they are carrying the same sort of traffic?—Many of the railway companies do not find waggons for coal and mineral traffic, but where they do I have no doubt that they give the preference to their own stock.

11,098. (*Capt. Galton.*) I presume that that is because they want to work their own stock to the greatest advantage, and if it is stock belonging to another railway company, being subject to the clearing-house regulations, they have to pay a demurrage upon it?—Yes, they are bound to work that stock with regularity or they have to pay the penalty.

11,099. (*Chairman.*) The reason I understand to be this, that when they are working their own waggons, if they do not work the trucks through within a certain time they would be liable to a loss for demurrage; but in the case of your waggons, so far from their having to pay demurrage, they charge the owners?—It is the loss of the owners.

11,100. Can you give the Commission any instances in support of that?—I have numerous instances with which I could furnish the Commission. I could mention the case of a waggon No. 338, which left the colliery on July the 6th and it came back on September 1st.

11,101. From where, and to where did it go?—It went to Bishops Waltham.

11,102. About what distance is Bishops Waltham from you?—It would be about 150 miles.

11,103. (*Capt. Galton.*) Have you a through-rate to Bishops Waltham?—We have. From Wednesbury.

11,104. (*Chairman.*) In that case did the waggon pass over more than one system of railway?—It would pass over three systems.

11,105. (*Capt. Galton.*) Do you know how long it was reaching Bishops Waltham?—No; I find I have not the particulars of that case with me.

11,106. (*Chairman.*) Will you state to the Commissioners any other special case of detention?—There is the case of waggon No. 753, which left the colliery on the 12th September, and it arrived home on the 28th of December.

11,107. (*Capt. Galton.*) Where did that waggon go to?—That waggon went to Reading.*

11,108. Have you a through-rate to Reading?—We have not.

11,109. (*Chairman.*) Over what systems did it pass?—It would pass over the London and North-western and the Great Western systems. There is another case that I could mention, that of waggon No. 739, which left the colliery January the 13th and arrived home again on the 27th of June.

11,110. (*Capt. Galton.*) Where did it go to?—That went to Reading also.†

11,111. Did you find out where the delay occurred in those cases?—In those cases those waggons were damaged in a collision on the Great Western Railway, and were put into a siding and there left, and no notice whatever taken of them.

11,112. Did not they notify to you that they were damaged?—They did not in reasonable time; they allowed them to remain there a considerable time before they notified it to us at all.

11,113. (*Chairman.*) Was that so in the last case?—In both those cases they were damaged. The builder's name is marked upon the waggon, and my name and address are painted on the waggon on each side, so that there was no excuse for not letting me know of it, and there is the Cannock Chase Company's name on the waggon also. But the practice of railway companies with regard to coal waggons is this, if they break the draw-bar or the coupling chain of a waggon in transit, instead of repairing that waggon and taking it on as they would do their own or a waggon subject to the clearing-house regulations, they take it off the train and put it into a siding, and send you a letter to say that it is there.

11,114. (*Capt. Galton.*) What do they do with its loading?—They allow the loading to remain in the truck; they simply write a letter to say that such and such a waggon is standing at such and such a station with a broken draw-bar, they having broken it themselves.

11,115. (*Chairman.*) And then they leave it there till you send for it to have it repaired?—They leave it there till either we send for it and repair it or we authorize the company to repair it and to charge us with the cost. This is continually happening, and the consequence is that our customers are greatly disappointed in many cases, and are obliged to go to other dealers for coal, and when our coal arrives there they do not require it.

11,116. (*Capt. Galton.*) If the waggon were a waggon belonging to another railway company instead of belonging to a private firm, would they in that case repair it themselves?—They would. I think that there is a clause in the general clearing-house regulations (1859) at page 23 referring expressly to that; in fact, articles 95, 96, 97, 98, 99, and 100 all apply to damaged stock. Those articles are as follows:—

"95. So soon as any part of the working stock of one railway passes into the custody and possession of another company, the company so in possession, is responsible for all and every contingency that may arise from the use of such stock while in their possession, except that, if the contingency is clearly traceable to a defect of material or workmanship; the ordinary repair or replacement of such stock is to be at the cost of the owners.

"96. The repairs of stock arising from ordinary wear and tear, is borne on all occasions by the companies owning

* This answer was afterwards altered by the witness to "that "waggon went to Bishop's Waltham *viâ* Reading."

† Afterwards altered to "to Blackwater *viâ* Reading."

the stock; but cases of palpable damage or negligence (such as dropping heavy weights into the waggons and thereby breaking the bottoms, smashing of doors, neglect of greasing, &c., &c.,) and all cases of collision or accident, shall be borne by the company in whose possession the stock may be at the time an accident happens.

"97. A register is kept by the clearing-house numberman at junctions, of such cases or palpable damage, but not of cases of damage arising from ordinary wear and tear.

"98. The clearing-house is not called upon to make any return of damaged stock; but the register of the numbermen is kept at the clearing-house for the purpose of verifying any claim made by one company on another in case of palpable accident. Companies on applying for a return will be furnished with a copy so far as its own stock is concerned.

"99. When a clearing-house numberman reports a vehicle as arriving at his junction in a damaged condition, such report is accepted as conclusive against the company delivering the vehicle at the junction, unless the company can show satisfactorily that it should not be held liable; but it shall be the duty of the numberman, whenever it is in his power to do so, to draw the attention of the chief clerk at the junction to the state of the damaged stock.

"100. Unless the account of the cost of the repairs of damaged stock be sent to the company responsible for the amount, within three months of the date at which the repairs are completed, the claim is forfeited."

11,117. (*Chairman.*) Do you think that if you took legal proceedings against a company for the cost of the damage to your stock caused by collision on their line you would have a legal remedy or not?—I believe we should, but then we should incur their displeasure, and they would throw no end of obstacles in our way afterwards. I have with me the replies that have been given to me by a railway company in answer to my letters complaining of a great many delays that had taken place, amounting to from five to 15 days; there were a great number of them, as many as 20 or 30 waggons. In one case the reply is, "In further reply to your "previous communications respecting the detention of "your waggons in transit, the specific cases you furnished have been thoroughly investigated, and I "find they were attributable to an unusual pressure of "traffic at the time. I trust now that the increased "power and other arrangements have entirely corrected the evil you complained of." That was on the 3rd of March 1865, and we are now in January 1866, and the same thing is going on.

11,118. (*Capt. Galton.*) Did you get similar replies from other companies?—Yes; there is another on December the 2nd, which is nearly nine months after that, from the same company. "In further reply to "your favour of the 18th instant, I regret to find that "a delay in this case did occur in consequence of our "siding at Reading being blocked at the time. I "have taken the matter up with Mr. Stevens, of "Reading, and I trust a further cause for complaint "will not occur."

11,119. (*Chairman*) That would be caused by a blocking up of the siding arising from want of locomotive power to remove the stock?—Yes; I can give an instance of where the waggons were emptied by our customer in due course, but they were not taken away from the station, and in reply to our complaint respecting it they say, "In further reply "to your favour of the 30th ultimo, I communicated "with the superintendent of the district respecting "the delays referred to in your letter, and he informed me that all the trains were so heavily laden "that the drivers refused to take the trucks in "question on, and that he sent a special engine on "the 30th ultimo to take them away." Those waggons had not been taken out of the siding on the 30th though they were emptied on the 23rd.

11,120. The company left them seven days on the siding?—The 23rd, the 24th, and the 27th, were the dates on which they were unloaded.

11,121. If they had had to pay demurrage on those waggons they would, you think, have been taken away before?—They would have been taken away as soon as discharged; there is no doubt of that.

11,122. (*Chairman.*) In this instance were you charged demurrage in consequence of the delay caused by the company's sidings being blocked by their own traffic?—There is no demurrage charged to us.

11,123. Have you any table which you could put in of such cases?—Yes; I have a statement of the working of the waggons from August 1864 to August 1865, showing the principal delays against one company; also showing the number of days that they were delayed, after allowing a reasonable time for travelling and unloading. A column shows the number of days the waggons were on the journey, and also the destination of the truck. I can also give two or three instances over some other lines of railway.

11,124. Could you furnish the Commissioners with a table showing a month's working for each company with whom you do business?—Yes, I will do so (*vide Appendix* BN.).

11,125. Have you any remedy to suggest for the better working of owners' waggons?—I think that waggons should be liable to the clearing-house regulations both in regard to transit and when they are at the stations.

11,126. (*Capt. Galton.*) Would that apply to cases of accidents as well?—Yes.

11,127. Then every accident, except from default of machinery, would be paid for by the company in whose possession the waggon was when the accident occurred?—They do now pay for damages by collisions and those kinds of things; they do not dispute that, but there is delay in getting the waggon home. But the other ordinary breakages, such as breakages of draw-bars, they do not pay, they consider that ordinary wear and tear. That depends very much upon the driver. If he starts roughly, or putting on steam too rapidly, the consequence is that he probably breaks three or four draw-bars, and that I should call the negligence of the company, but they call it ordinary wear and tear, and they make us pay for it, in fact, they make us pay for everything except collisions.

11,128. The only thing that the company pays for in the case of waggons belonging to other railway companies is for defective material?—Yes.

11,129. (*Chairman.*) But in that case how do you stand in a different position from other railway companies, because, according to the clause of the clearing-house regulations which you have put in, it is provided that the cost of repairs of stock arising from ordinary wear and tear is borne on all occasions by the companies owning the stock?—Precisely; if it is ordinary wear and tear they would.

11,130. But do they not consider, in the case of other companies waggons, that the breaking of draw-bars and such like accidents come under the head of ordinary wear and tear?—In that case they are liable to the clearing-house regulations, consequently they repair the draw-bar and send the waggon home. They are liable to pay demurrage, and therefore it would be better worth their while to repair the draw-bar and send it home than be subject to demurrage.

11,131. (*Capt. Galton.*) The demurrage is paid, is it not, whether the waggon is injured or not?—Yes.

11,132. And do you think that by putting the waggons under the clearing-house regulations you would obviate all the difficulties which you have been describing?—I believe we should, both with regard to delays and damaged stock, and all the other things of which we now have to complain.

11,133. And you think that that would meet all the evils which now exist in that respect?—I believe it would.

11,134. (*Chairman.*) In fact, you think that if a railway company were liable to the private owners for demurrage in the same way as they are liable to other railway companies, you would have a remedy for those evils?—I believe that the traffic would be very satisfactorily worked if waggons were liable to the clearing-house regulations. If the traffic is worth having to the railway companies, it certainly must be worth working it well, or it is not worth working it at all,

Mr. J. N. Brown.

11 Jan. 1866.

and I believe that if they were under penalties to work the traffic well it would be well worked.

11,135. (*Capt. Galton.*) Would you give a railway company the option of refusing to take owner's waggons if they did not choose?—No; I would compel them to take them if the waggons were fit to travel.

11,136. Are not the clearing house regulations made by voluntary agreement between the railway companies; that is to say, all the companies have mutually agreed to put them in force?—Yes.

11,137. And now I understand that your proposal is to make those regulations compulsory upon the railway companies in respect of other parties?—Precisely. I have applied to the clearing-house to have our waggons admitted also; but they say, No, you are not a railway company, and we cannot admit you. I do not see why there should be any difference between a private waggon and a railway company's waggon. The clearing-house is formed under an Act of Parliament, 13th and 14th Vic., cap. 33, 25th June, 1850, and the same rules and regulations might apply to us as well as to all large bodies, running a large quantity of railway stock.

11,138. Are there no railway companies who are not under the clearing-house?—Not one that adopts through-rates and allows its waggons to run on to another system.

11,139. (*Chairman.*) Would you apply this rule to all colliery owners without distinction whether they have a large quantity of rolling stock or not?—Yes, I would apply it to all.

11,140. (*Mr. M'Clean.*) To mineral waggons generally?—To mineral waggons throughout the country.

11,141. (*Chairman.*) Could you give the Commission any idea of the minimum number of railway waggons that a private owner of the smallest colliery would find it worth his while to use in his business?—Of course that must depend in a great measure upon the size of the colliery, but there are private traders who have waggons as low in number as five, and there are colliery owners who have waggons from 100 up to 3,000.

11,142. Would you compel railway companies to admit a trader owning only five waggons to the clearing-house?—Yes; there is no trouble or expense in the matter; there is no extra cost incurred. I think if it is made applicable to one it should be to all.

11,143. (*Mr. M'Clean.*) Do any railway companies and waggons for minerals?—The North-eastern Railway Company find a great many waggons for minerals, and the Great Northern also.

11,144. (*Capt. Galton.*) Is not it the case that the North-eastern Company find the whole of the mineral waggons?—Not the whole of them.

11,145. (*Mr. M'Clean.*) Very nearly all?—Nearly all; but on parties applying to the North-eastern Company for waggons, they sometimes reply that they have not sufficient to carry on the traffic, and the parties must find their own. I have known many applications made to the North-eastern Company lately for waggons, but the trade was so large that they could not supply them, but they find all that they possibly can. The Great Northern Company do find a very large quantity. The London and North-western Company do not find any, and the Midland Company do not find any. The Midland Company has the largest mineral traffic in the kingdom, and they do not find a single truck.

11,146. (*Capt. Galton.*) But would not it be the case that some extra trouble would be caused by the necessity of taking notice of all the owners of waggons?—The parties would be charged with the expense, and charged according to number. If a railway company has ten thousand numbers taken during the month, it pays its proportion according to the expense of keeping the accounts.

11,147. That would necessitate keeping an immense number of separate accounts at the clearing-house, would it not?—It would.

11,148. Would not the result probably be that traders having a very small amount of traffic would find it worth their while then to find their own waggons?—I think not.

11,149. Do you not think that if their waggons were returned speedily it would become better worth the while of private traders to find those waggons?—It probably would increase the number of waggons in the hands of private traders.

11,150. That would again increase the trouble of the accounts?—But they have numbering-men at all the junctions, I do not think that the cost would be any more. It would give a little more trouble in posting the account at the head office in London, but there would be no additional expense at the junctions.

11,151. (*Mr. M'Clean.*) Would you be prepared to pay your portion of the cost?—I should be prepared to pay my portion of the cost.

11,152. (*Capt. Galton.*) You think that no material objection would result from that plan on the score of increased trouble?—I cannot see any.

11,153. (*Chairman.*) Now, as I understand, in the case of a trader sending as small a number as five waggons for a distance of 150 miles, the empty waggons are returned according to the convenience of the company?—Entirely so.

11,154. In the case which you propose of the railway company being liable to demurrage, if they detained the waggons, would you make them send so small a number as five empty waggons back specially?—No, they would come back with the ordinary trains during the day; it would never be necessary to run so small a number as five trucks.

11,155. That is to say, if it was not convenient for them to send those five trucks back to-day, it would not be unfair for the company to pay the owners demurrage for keeping those trucks to suit their convenience till to-morrow?—Not at all unfair; there would never be any necessity to leave so small a number of empty waggons behind as five. It is very necessary that there should be some check or some place where we can apply to know where our waggons are; for instance, there were some waggons went away belonging to the Gloucester Waggon Company six months ago; two of them have been lost entirely; if we could only apply at the clearing-house we should know at once where to find them, but we do not know where they are, and in all probability they will be lost altogether.

11,156. (*Capt. Galton.*) Do any railway companies over whose lines you send waggons find waggons for you?—Not for us, except from our colliery in the north. We have a colliery at Newcastle-on-Tyne, and the railway company find waggons there.

11,157. What difference in charge do the companies make if they find waggons, and if they do not?—According to distance; sometimes one-eighth of a penny, sometimes one-sixteenth, and sometimes a farthing per ton per mile, according to the distance of the mileage.

11,158. The railway companies could, if they chose, find waggons for you instead of admitting your waggons on their line, I presume?—They could.

11,159. Do you think it desirable that they should have the option of finding waggons themselves?—I do, providing they charge a reasonable sum for the use of them.

11,160. Does the sum which you have mentioned, the sixteenth of a penny per ton per mile, pay the proprietor of the waggon?—That would be for distances over 150 miles, and in that case it would pay; distances under 150 miles are an eighth.

11,161. Not under that distance?—Under that distance they would charge one-eighth of a penny.

11,162. And that would pay a good per-centage upon the stock, would it not?—It would.

11,163. (*Chairman.*) In the case of one of your customers neglecting to unload a waggon within a reasonable time after its arrival at the station to which that waggon has been consigned, do the railway companies now charge for station siding room?—In many

cases they do; they charge a shilling a day In many cases they have given notice that they will charge 1*s.* a day for standing room at stations, provided the waggons are not discharged within 24 hours after arrival; but they fail to put the waggon into a position in which the consignee can get at it to discharge it, and in consequence of that they are unable to enforce the charges and they get into confusion, and, in many cases, they have had to withdraw that notice.

11,164. That is to say, it is so hard now, in consequence of the confusion at some of the stations, to tell whether the person to whom the coals have been consigned had or had not an opportunity of getting at the waggons to unload them, that in practice they do not make any charge?—Precisely so.

11,165. (*Capt. Galton.*) The facts which you have been mentioning as to the very great delays which take place in the return of waggons would appear to point out that if the railway companies worked the waggons so as to return them with the greatest speed to the collieries a very much less number of waggons would carry on the trade of the country than are now employed?—That would be the operation. I have no doubt that if we take into consideration the railway companies' own stock and the private owners' own stock it takes nearly 50 per cent. more waggons now to carry on the trade of the country than it did 10 years ago.

11,166. You mean 50 per cent. in proportion to the trade carried?—Yes.

11,167. That is to say that in order to carry 100 tons of goods now it takes 50 per cent. more stock than it used to take?—Yes.

11,168. (*Chairman.*) But 10 years ago there were no clearing-house regulations with regard to owners' waggons any more than there are now?—Not for private stock, but the lines were not so full of traffic 10 years ago as they are now, and the traffic was worked with greater regularity, and then the railway companies were competing and looking out for traffic in every direction, whereas now they are so full that the mineral traffic has to take its chance.

11,169. (*Capt. Galton.*) Do you think that if the railway companies found the whole of the waggons the amount of stock in the country to carry the same traffic could be very materially diminished?—I have no doubt it would, but I question whether the colliery owners would get a fair supply. There is no doubt that if the rolling stock of the country was common stock belonging to the clearing-house and the clearing-house only, a very much less number of waggons would be required to carry on the traffic of the country, but the probability is that the railway companies would not get a fair proportion of them. I am speaking now upon the supposition that the whole stock of the country belongs to the clearing-house, and that the railway companies have to look to the clearing-house for a supply of stock. I say that in that case one-half the waggons would carry on the trade of the country, but in all probability the railway companies and the colliery companies would not get a fair supply of waggons.

11,170. You mean that the clearing-house would stint the supply in order to get the maximum profit upon the number of waggons that they had?—I will give an instance. Supposing there are 200 waggons sent from London to Liverpool with a large quantity of wool or tobacco, or any other consignment; instead of sending those waggons back to London empty, supposing they belonged to two companies, for instance the London and North-western as far as Birmingham, and another company from Birmingham to Liverpool, those waggons under the clearing-house regulations would be sent back as soon as they were emptied; but if they belonged to the clearing-house they would, in all probability, be kept at Liverpool for a return load.

11,171. And, therefore, although the traffic would be carried by a less number of waggons, yet the facilities would be very considerably diminished?—Yes; the waggons would be at a distance of more than 300 miles from the place where they were wanted just at a particular time.

11,172. (*Chairman.*) Would not it come to this, that if the waggons were left at Liverpool for return loads, it would not then be necessary to send so many waggons from the clearing-house to Liverpool to bring the Liverpool traffic to London, or wherever it was to go; but if that system of keeping waggons for return loads did not prevail would not you want an extra number of empty waggons to send over the lines, if they were not kept for return loads?—Yes, but you would have a shorter distance to work them; you might work them from a station perhaps within 10 or 15 miles of the place, instead of running back empty as they now do, say from London to Scotland, London to Aberdeen, or Glasgow, or Edinburgh; and when they required waggons at Glasgow or Liverpool they would get them from some nearer station, perhaps within 20 miles of the place, if there was a common stock.

11,173. Would not that rather tend to economise the stock, and therefore to leave a greater number of empty waggons at the disposal of the clearing-house for the supply of your collieries?—It would leave a greater number of empty waggons at the disposal of the clearing-house, but it would be at the wrong place. I should be afraid that the waggons would be at London when they were required.

11,174. (*Capt. Galton.*) Take the case of empty waggons which are sent to Scotland; if there was a return traffic to Scotland, the railway companies now would not send those waggons empty, would they?—No.

11,175. They do not send empty waggons back to Scotland, do they?—They do not keep them a day. Supposing they know that there would be traffic within two days for Scotland, they do not keep those empty waggons those two days. They send them home on account of their being subject to demurrage. Take a railway like the South Staffordshire railway, which is exporting all its traffic; there are a thousand tons of iron going away from its stations daily, but there is nothing coming back from the ports to those stations, and the consequence is that the traffic is going all in one direction; and I do not know how they would get their supply of waggons if they were not obliged to send them home.

11,176. In that case, under whatever system and wherever the waggons were, would not it then be necessary always to send the empty waggons one way, for if, as in the case of the South Staffordshire Railway, the traffic is entirely outwards, it is an absolute necessity that the waggons should run empty one way, is it not?—Yes, I may remark that there is a large quantity of traffic going from South Staffordshire to Hull for shipment, and when those waggons are discharged at Hull in all probability they might be loaded back to Nottingham or Derby, if it was common stock; but not being common stock they are obliged to send them home empty.

11,177. But still the amount of import to Nottingham and Derby would be nothing, I suppose, in comparison with the amount of export, in bulk at all events, from South Staffordshire?—In many cases it would. Take Burton as an instance. There is an immense quantity of barley carried from Hull to Burton during the season, quite sufficient to load back all the iron waggons that leave Staffordshire, and instead of the waggons returning to Staffordshire empty, they might bring barley back to Burton; but they cannot load them back to Burton now, because they are not common stock; they belong to another company.

11,178. Do you think that that would interfere with the South Staffordshire trade?—I think it would. I think they would not be able to get a supply of waggons.

11,179. Would not that rather lead to the whole of the traffic being worked more under a uniform system rather than that any particular part should be starved?

Mr. J. N. Brown.

11 Jan. 1866.

—No; I think the various companies would stop the waggons on the route if they were common stock and if they wanted them, and they would take them off at any station if they required them, and not let them go forward to stations at which they were very badly wanted.

11,180. Must you not assume that if they were common stock they would be worked under the directions of some central office which would take care to keep every station properly supplied, as it would know the position of every waggon in the country by telegraph every day?—I do not think that it would be possible to carry that out.

11,181. (*Mr. M'Clean.*) Would it not be impossible to have a common stock unless the whole of the railways were under one management?—Yes, I know that; some stations would run short, and they would not get their supply of trucks. If I was the manager of a railway and I had 1,000 tons of iron going to a port for shipment, and I had not a single waggon on hand to take that 1,000 tons away, if a train of empties came through my station I should stop that train and take them off and fill them with that iron.

11,182. Then the present system is the best you can devise?—No, the other would be the best if it could be carried out; but I do not think that it is practicable; the question is so important that it is worth the experiment.

11,183. (*Chairman.*) Do you get through rates to all the stations to which you send coal?—We do not. The South-eastern Railway Company refuse to make through-rates with the London and North-western Railway Company, and the Great Western Railway Company do not make through-rates for coal with the London and North-western Company, and the South-western Company do not make through-rates excepting in two or three special cases. We have through-rates all the way from the colliery down to Brighton, and all stations on the Brighton line, but we have no through-rates by the Midland Railway down to Gloucester and Bristol.

11,184. (*Capt. Galton.*) Why does the Midland Company refuse to give you through-rates; is it because of their own collieries?—On account of other companies declining to make through-rates with them.

11,185. Does not the London and North-western Company make through-rates with the Midland?—Not in all cases; they do in some cases.

11,186. Do you consider that railway companies should be compelled to give through-rates in every case?—I do.

11,187. (*Chairman.*) When you say that they will not make through-rates, do you mean that each company charges its local rate, or that they will not give you through-booking?—They will neither book through nor make a through-rate; each company charges its local rate, and requires a separate declaration.

11,188. (*Capt. Galton.*) Do you mean that you have to send a declaration to each separate junction?—If a waggon leaves our colliery for Southampton, we should take the London and North-western line to Wednesbury, that would be one charge; then when it got to Wednesbury the Great Western Company would require another declaration, and they would carry it to Basingstoke, that is a second charge; at Basingstoke it would be put into a siding till our declaration arrives, and that would be another charge, so that it is three junctions and three declarations that would be required.

11,189. How do you send your declarations to those distant stations; do you do it by post?—In some cases by post, and in some cases by train.

11,190. (*Chairman.*) The result of that would be, that if your declaration had not arrived, say at Basingstoke, as soon as your trucks, the trucks would be detained there till it did arrive?—It would be so in many cases. Declarations miscarry sometimes, and waggons remain at the junction several days waiting for the declaration, and we know nothing of it till in a week's time they write to us, probably to say that the waggon is standing there, and that they have had no declaration.

11,191. Do they not know where the waggon is consigned to?—Yes, there is a ticket on it bearing the address.

11,192. Do you find that the detention at junctions is very great?—It is very great.

11,193. Can you give any instances of it?—There is very great detention at the Wednesbury junction by the Great Western Company. I have numerous instances which I could mention, and their reply to my complaint has been, that it is for want of locomotive power.

11,194. (*Mr. M'Clean.*) Do you find that there is much detention at Reading?—Very great; there is a very great want of accommodation at Reading; there is not half siding room enough to carry on the traffic of the station.

11,195. (*Capt. Galton.*) Is that on the Great Western station or on the South-eastern station?—On the Great Western. I think I have with me now 300 or 400 cases of delay at Reading within a year.

11,196. (*Chairman.*) Have you a mileage rate for coal in owners' waggons, and does that rate apply throughout England?—We have a mileage rate which is applicable to the London and North-western railway only. First of all we have a minimum charge of 1*s.* for short distances, junction to junction; when unloaded at the station there is 3*d.* extra.

11,197. That 3*d.* extra is a terminal charge, I presume?—Yes, it is a terminal charge. Then for distances under 50 miles the charge is 1*d.* per ton per mile, but there is no less charge than 4*s.* 2*d.* if it runs 60 miles. Then beyond 50 miles up to 100 miles the charge is $\frac{3}{4}d.$ for the whole distance, but as I say there is no less charge than 4*s.* 2*d.* for distances over 50 miles until it amounts to that sum at $\frac{3}{4}d.$ per ton. Then over 100 miles the charge is $\frac{1}{2}d.$ Those rates apply to the London and North-western system only, they do not give through-rates over the other lines, so that, if our traffic goes 200 miles, when we get to Basingstoke for instance, we should be subject then to fall back upon the local charge again, although the coal has come all the way from Staffordshire.

11,198. (*Chairman.*) Is the local charge a fixed charge that the public can always ascertain, or have you to ask for it?—They refuse in many cases to give you a list of the rates, but they quote any rate that you ask for.

11,199. (*Capt. Galton.*) You get a through-rate on the London and South-western from the colliery, do you not?—Yes, to one or two stations only; to Bishops Waltham we have a through-rate from Wednesbury only. We had a deal of trouble in getting that rate, but I obtained it ultimately, and the consequence is that they have had a very large quantity of traffic. The Great Western Company have had a very large traffic, which formerly came through London.

11,200. (*Mr. M'Clean.*) Is it a through-rate from the colliery, or from the Wednesbury station?—From the Wednesbury station only, not from the colliery.

11,201. (*Capt. Galton.*) How do you get to the Wednesbury station?—By the London and North-western Railway.

11,202. (*Chairman.*) Are we to understand you to say that every time you are sending a number of trucks of coal to any other station on the South-western line except Bishops Waltham you have to apply to that company for a rate?—No; we have a list of rates from the South-western, but the South-eastern Company have refused to give us one; but if we name a station to which we wish to send coal they will give us a rate, and the consequence is that if a merchant applies to me for the price of coal at Canterbury, if I have not that rate ready, I should have to apply to the South-eastern Company to obtain it, and it would take perhaps a week to obtain.

11,203. (*Capt. Galton.*) Are you now speaking of

a through-rate from the Wednesbury station, and not from the colliery?—From the colliery.

11,204. Do you consider that it would be desirable that the railway companies should publish their rates?—I do.

11,205. Of course allowing them to make special arrangements for large quantities of traffic?—Precisely.

11,206. Still those special arrangements should be equally published for the knowledge of the district?—Yes, and made applicable to all parties.

11,207. (*Chairman.*) Do you find that railway companies make differential rates in favour of one part of the country as against another part?—In many cases they do.

11,208. (*Capt. Galton.*) Does the Midland Company give you through-rates?—No; our colliery is not on the Midland railway. We deliver first to the London and North-western, and it is the London and North-western Company from whom we should get the rate.

11,209. And can you get a rate on to the Midland line?—No, we do not; we have to send to Birmingham to get the local rate from Birmingham to Gloucester and Bristol: that is the only branch of the Midland system that we send to.

11,210. Do you get favourable rates from the Midland Railway Company?—We do.

11,211. So as to enable you to compete with the coal from their own line?—Their rates are not so favourable as those from Derbyshire and Leicestershire; they there have a low mileage rate on account of the distance through from Derbyshire down to Gloucester, but we delivering our coal at Birmingham are subject to the local rate.

11,212. You cannot deliver coal at Gloucester along the Midland railway at a lower rate than the Derbyshire coal can be delivered?—No; many of the Derbyshire collieries situated 30 miles further from Birmingham than ours, get coal carried at the same price that we do.

11,213. So that both coals come into the market at the same price for carriage?—Precisely; although the one is a greater distance than the other by 30 or 40 miles.

11,214. Do you object to that system?—Yes; I think that there should be an equal mileage rate.

11,215. So as to give each firm or district the advantage of its position?—Yes.

11,216. And the disadvantage of its position?—Yes.

11,217. (*Chairman.*) Are we to understand you to suggest that those Derbyshire people should be charged a higher mileage rate than they are now, or that your mileage rate should be proportionately reduced to what theirs is; to Birmingham, for instance?—What I would wish is that we should be put upon the same mileage terms; that if we send coal 200 miles we should have the same rate, or if we send it 100 miles we should have the same mileage rate that they have.

11,218. (*Capt. Galton.*) For instance, in sending coal to the north-east of England, you would not be able to compete, would you, with the firms which lie nearer the north-east than you do?—We do not send any coal at all to the north-east of England. The Midland Company's Leicestershire and Derbyshire fields supply that district, and we cannot get there at all on any terms.

11,219. (*Chairman.*) Is that on account of the rates charged you by the railway company, or is it from other causes?—In many cases it is on account of the rates; and it is on account of our being a long distance from the place of consumption of the coal. We do not attempt to supply the Midland district at all to the north-east, the only portion of their district that we supply is that between Birmingham and Bristol and the west.

11,220. (*Capt. Galton.*) In that part there is competition against you by the Derbyshire coal?—Yes, because they get a through-rate, whereas we have to pay two local rates.

11,221. The Derbyshire coal owners, therefore, can get a through-rate to Gloucester and Bristol, and compete with you there, whereas you are unable to get a through-rate to Lincoln or Hull to compete with them?—Precisely so; that is the operation of the present system.

11,222. (*Chairman.*) What is the cause that the railway company will not give you a through-rate?—No doubt in the case of the west, the Midland Company wish to keep the traffic upon their own line of railway, and to supply from their own collieries, and they have no desire to see our traffic come on to their railway at Birmingham.

11,223. (*Capt. Galton.*) The coal traffic to Gloucester and Bristol from Derbyshire passes over a greater length of the Midland Railway, does it not, than your coal traffic would?—Yes, 50 miles more.

11,224. But still if they charged you the same price that they charge those Derbyshire coal owners, would not it be better worth their while to take your traffic the shorter distance than to take theirs?—If we were charged the same mileage rate, of course it would be that loss of mileage to the company.

11,225. But as it is you state that you are charged the same price for carriage of your coal to Gloucester that the Derbyshire coal owners are charged from Derbyshire to Gloucester?—Yes; we have to pay the London and North-western Company 15*d.* to Birmingham, which the Midland Company would lose. The London and North-western Company have the pull out of it in that case; but, in the other case, the Midland Company have the pull.

11,226. (*Chairman.*) If it is profitable to the railway companies to carry the midland coal in competition with yours to Gloucester and Bristol, why should not it be equally profitable to the railway companies to make a differential rate in your favour so as to enable you to send coal to Hull and the eastern coast?—It would be profitable to them to allow us to do so, no doubt, but they decline; they prefer having the coal from their own line of railway. If they gave us a through-rate to Lincoln, Derby, and Nottingham, I should expect one to the west also, and it would be prejudicial to them to give us a through-rate to the west, and therefore they ignore the through-rate altogether.

11,227. (*Capt. Galton.*) Your complaint is against the system, and not against any particular railway?—Not at all; it is against the system.

11,228. (*Mr. M'Clean.*) Have you any suggestion to make with respect to improving the traffic arrangements of the carrying trade in general?—Yes, I think with regard to the carrying trade I have; I think that there should be a general classification applicable to all railways. In many cases, now, they have separate classifications for their own lines of railway for what they call local traffic, and I think that there should be through-rates, also, everywhere, and that there should be equal mileage rates for each class of traffic.*

11,229. You mean maximum rates?—Yes.

11,230. (*Capt. Galton.*) There are maximum rates now, are there not?—No, not carrying rates.

11,231. Each Act of Parliament contains, does it not, maximum rates, exclusive of terminals?—Not as carriers. There is nothing binding the railway company to carry, and there are no carriers' rates laid down in any Acts of Parliament, they are all tolls

* The witness subsequently added the following. I would suggest something like the following arrangement:—1st. General classification applicable to all railways. 2nd. Through rates. 3rd. Equal mileage rates for each class of traffic. 4th. Maximum charge for short distances. 5th. Special contracts at any reduced rates, so long as the same are made applicable to all traders in the same district. 6th. Charge for station accommodation to include porterage. 7th. Cartage charges for collection and delivery of goods. 8th. To be under legal obligations to carry all traffic, and to collect and deliver all traffic, except minerals and special articles to be classified.

Mr. J. N. Brown.
11 Jan. 1866.

which they would charge anyone for the use of their line. There are no fixed charges in any Act of Parliament to bind a company to carry certain articles at a maximum rate.

11,232. At present the maximum charges are exclusive of terminals, are they not ?—Yes, and exclusive of porterage and station accommodation. The tolls set forth in Acts of Parliament include the use of the railway in one case, and in another case the use of the railway and the cost of the waggons and the amount to be charged for locomotive power. There is nothing said about risk, there is nothing said about porterage or loading or unloading, or station accommodation, or the risk of carriage, or collection, or delivery, and various other things, and the consequence is that the companies charge what they please.

11,233. Do you consider that the maximum charge should be specified for all those points by Act of Parliament ?—Yes, I think that there should be a maximum fixed.

11,234. (*Chairman.*) What I understand you to mean is this, that there is no maximum rate to include all those contingencies that you have mentioned ; that there is a maximum rate as regards the haulage, but that they increase that rate indefinitely by raising their terminals to any amount that they think fit ?—Yes ; that the maximum rate is not applicable to parties sending traffic ; it only applies to parties using the railway with their own locomotive engines and so on.

11,235. That is never done, is it ?—In some cases it is, but in very few.

11,236. (*Mr. M'Clean.*) When you propose an equal mileage rate, do you mean inclusive or exclusive of terminals ?—Exclusive of terminals, and that all rates should be calculated upon the shortest railway distance.

11,237. (*Chairman.*) You mean that if you were sending goods from Birmingham to London by the Great Western Railway they should not be entitled to charge you more for the extra mileage than if you were sending them direct by the London and North-western Railway ?—Just so.

11,238. (*Mr. M'Clean.*) Would not that be inconsistent with the mileage rate of which you have spoken ?—No, I think not.

11,239. (*Chairman.*) In fact, you are of opinion that the shortest mileage should govern the rate ?—Precisely. If a company carries traffic 50 miles round the trader has no right to pay for it. This is only with regard to maximum charges ; of course companies may be at liberty to charge less if they please, I only propose to fix the maximum. They may carry for one-half, or one-quarter, if they please, but the maximum should be calculated upon the shortest distance.

11,240. You would allow a railway company to carry in competition with another railway company at a lower rate, so long as neither company exceeded the maximum rate which you would have fixed ?—Yes, I would.

11,241. (*Capt. Galton.*) Just as they do now ?—Just as they do now. Then there should be a minimum charge for short distances, and that no company should be obliged to carry five or six miles without a fixed charge.

11,242. You would leave to the company, would you not, the option which it now possesses of charging a lower fare altogether ; for instance, from Birmingham to London, than it need charge from Watford to London ?—Yes, if they wished it.

11,243. (*Chairman.*) Would you under no circumstances allow a railway company to go below their minimum rate for a short distance if by that means they could get a greater quantity of traffic ?—Yes ; I would allow them to carry for any rate they pleased, fixing the maximum. Supposing traffic is going six miles, and that is goods traffic, I would not compel any railway company to carry a ton of traffic six miles for less than 2*s.* 6*d.* if it is miscellaneous goods traffic, but they may carry it for less if they please.

11,244. You would fix the maximum but not the minimum ?—Precisely. Then with regard to special contracts, I would allow them to make special contracts at any reduced rates so long as the same rates are made applicable to all traders in the same district.

11,245. (*Capt. Galton.*) That would involve the publication of rates or the publication of conditions, would it not ; that is to say, you would make them publish to the whole district the special contracts which they make ?—I do not know that that would be necessary. If I, as a large trader in the South Staffordshire district, supposed for one moment that another colliery was getting its coal carried cheaper than I was getting mine carried, if I applied to the railway company for a rate I should expect to get it, and to be put upon the same terms.

11,246. Unless it was published, how could you be certain of it ?—I could soon discover it. I would leave it to the trade to discover.

11,247. (*Chairman.*) Then it would be necessary in that case to map out the country into a certain number of defined districts, would it not ?—No, I think not.

11,248. Have you any other suggestion to make to the Commission ?—What I have said refers to the mileage only. I think that there should be a charge for station accommodation, including porterage. In many cases large works have their own sidings into the works, and they load the whole of their traffic, and they do everything that is necessary at one end, and deliver it on to the railway in the trucks, and then the railway carries it to the other end, and there they have to unload it and deliver it. In one case they would be allowed the porterage and cartage charges, but at the other end they would not, and I would have the porterage and station accommodation defined, 1*s.* 6*d.* or 2*s.* a ton at each end, whatever may be fixed.

11,249. (*Capt. Galton.*) Would you make that charge universal throughout the country ?—Yes.

11,250. You do not think that the conditions of different stations would be sufficient to warrant a difference in the charge ; for instance, that the charge in London should be greater than the charge at some small country station ?—I would make the maximum applicable to all, and if they found that they could do it for less money at some country stations they should be at liberty to reduce it if they thought proper.

11,251. Would not it be more likely that they would reduce it at a station where there was a large competition, such as Birmingham or South Staffordshire, or London, and that they would charge their highest maximum rates at the small country stations where there was no competition ?—I do not think that there would be much difference in the charge for station accommodation and porterage. I think it is pretty much the same throughout the country. The next suggestion that I would make is with regard to the cartage charged for delivery ; and there London would come in. There should be a fixed charge for cartage throughout the country ; and in special cases like London of course there would be a fixed charge named, say, 5*s.* or 7*s.* 6*d.*, or whatever the case might be. There are only two or three exceptions throughout the country where the charges are heavy, and London is one.

11,252. (*Mr. M'Clean.*) Would Liverpool be one ?—In Liverpool they deliver a great quantity of traffic by barge. The railways run along the quays there, and the cost of delivery in Liverpool is very much less than it is in London.

11,253. (*Capt. Galton.*) But you would have the maximum for all these charges fixed by Act of Parliament ?—Yes, I would.

11,254. And it should be applicable throughout the country ?—Yes ; and then I would suggest that the railway companies should be under legal obligations to carry, to collect and to deliver all goods' traffic ; everything, in fact, except minerals and special articles to be classified,

11,255. (*Mr. M'Clean.*) How could you oblige them to collect?—Goods they do collect now, and there is no difficulty at all in it. If I have a ton of goods to send I give the railway company notice that it is at the works, and they send a waggon for it; they do that now.

11,256. They do that only in places where they have their own waggons?—Yes.

11,257. (*Capt. Galton.*) I presume that you would limit the distance from the station at which they were to collect?—Yes; they have certain limits defined in each town now.

11,258. Would you compel them to start waggons and carts at stations where they do not now possess them?—No; wherever they have a carting establishment they should do it, but where they have not I would not compel them to put them on; in many cases it would not pay; in small country stations, for instance, it would not pay. Railway companies always take care to put on a cartage establishment where it will pay.

11,259. How could you fix that by Act of Parliament; you simply say, do you not, that where they do collect they shall collect within a certain radius, and that they shall do it at certain fixed charges?—Yes; precisely where they have an establishment for that purpose. I do not think that there is any difficulty in that matter.

11,260. (*Chairman.*) You stated in one of your answers that you would except minerals from the compulsory obligation of collection and carriage; are the Commission to understand you to say that you would not compel a railway company to carry minerals?—Not to cart coals, or certain large articles. If, for instance, a man makes a boiler, weighing 20 tons, and he wants it fetched to the railway, I would not compel the railway company to fetch an article of that kind, because they might have to build a separate carriage to convey it; there are several large articles of that description which might be excepted.

11,261. Then would you require that all other articles should be collected excepting those large articles?—Yes.

11,262. Do I rightly understand you to say that you would make it compulsory upon the railway company both to collect and deliver, and carry all articles except minerals?—I think so.

11,263. Would you except minerals from being compulsorily carried on the line?—No, not at all.

11,264. Only from compulsory collection?—From compulsory collection and delivery.

11,265. You would compel them to carry minerals?—Yes, certainly.

11,266. When you used the word carry in connection with delivery and collection, you meant it merely in the limited sense of cartage?—Precisely so; merely as to cartage.

11,267. Have you any other suggestion to make to the Commission?—I think not.

11,268. When you speak of minerals, I assume that you mean what is called in the clearing-house classification the mineral class, including bricks and stone?—Yes, anything that appears in the mineral class in the clearing-house classification.

11,269. In the station to station class?—Yes; precisely.

The witness withdrew.

Mr. Michael Daintry Hollins examined.

11,270. (*Chairman.*) We understand that you are the senior partner in the firms of Minton and Company, china and earthenware manufacturers, and Minton, Hollins, and Company, encaustic tile manufacturers, at Stoke-upon-Trent?—I am.

11,271. Are you also chairman of the Staffordshire Potteries Chamber of Commerce?—I am, and have been since its formation in 1851.

11,272. Of what class of manufacturers does that chamber consist?—Entirely of china and earthenware manufacturers.

11,273. Are you authorized to speak here for the members of the Chamber of Commerce, or do you merely wish to give evidence on your own behalf?—I am here to speak on behalf of the Chamber of Commerce and as representing the district in the Potteries.

11,274. Have you any objection to put the preliminary statement in as the substance of the evidence which you are prepared to give?—None whatever.

The witness delivered in the following statement:

"Minutes of Evidence to be given by Michael Daintry Hollins, Esq. (Chairman of Staffordshire Potteries Chamber of Commerce), before the Royal Commission on Railways.

"Is the senior partner in the firms of Minton and Company, china and earthenware manufacturers, and Minton, Hollins, and Company, encaustic tile manufacturers, both firms carrying on business at Stoke-on-Trent, in the Staffordshire Potteries.

"Is chairman of the Staffordshire Potteries Chamber of Commerce, and has been such since the establishment of the Chamber in 1851.

"The Chamber of Commerce is at present composed exclusively of china and earthenware manufacturers.

"The district of the Staffordshire potteries comprises the towns of Tunstall, Burslem, Hanley, Stoke-on-Trent, Fenton, and Longton, with an aggregate population of about 110,000.

"Has for a great number of years taken a great interest in the question of railway and canal communications for the Potteries, and has repeatedly given evidence before Select Committees of both Houses of Parliament.

"Prior to the formation of the North Staffordshire Railway Company's lines, the Staffordshire Potteries had no railway system nearer than the main line of the London and North-western Railway Company between Stafford and Crewe.

"Nearly all the clays, flints, and other materials used in pottery manufacture are imported into Staffordshire from the south and south-west of England.

"Prior to the formation of the North Staffordshire Railway Company's lines all such materials were brought by sea to Runcorn on the River Mersey, and thence by the canal of the Duke of Bridgewater's trustees to Preston Brook, and thence by the Trent and Mersey Canal to the Potteries.

"The Trent and Mersey Canal system consisted of about 100 miles; from Stoke towards London (*i.e.* to the junction with the Coventry Canal at Fradley near Lichfield,) it extends 30 miles, and from Stoke to Preston Brook (6 miles from Runcorn), it extends 36 miles; it also extends to near Burton-on-Trent.

"In 1845, before applying to Parliament for their railway bill, the North Staffordshire Railway Company agreed to purchase the Trent and Mersey Canal for 1,170,000*l.*; that purchase was sanctioned by Parliament in 1846. The purchase money was nine times the original capital of the Trent and Mersey Canal Company, and nearly three times the actual cost of the canals. The railway company guaranteed a preference dividend of 5 per cent. per annum upon the 1,170,000*l.*, which they have ever since continued to pay. To enable the railway company to earn this large dividend from the canals, they have had to maintain high tolls.

"By means of the purchase of the Trent and Mersey Canal Company by the railway company, the railway and canal communications of the whole district thus became vested in the hands of the railway company, and are still so vested.

"Is of opinion that the amalgamation of railway and canal companies is very prejudicial to the trading interests, and considers that if Government takes upon itself to revise the present railway system, the canal system should be completely detached from the railway system, so that there might be real competition between railway and canal.

"The case of the Staffordshire Potteries district is a strong instance of the evils of this system. Northwards the North Staffordshire Railway Company possesses 36 miles of canal and 15 miles only of railway. Southwards they possess 30 miles of canal, and 18 miles only of railway.

Mr. M. D. Hollins.

21 Jan. 1866.

"Every company having the command of different routes will naturally direct the traffic as far as possible over that route which will give that company the greatest mileage.

"The policy of the North Staffordshire Railway Company has therefore been to force the traffic as far as possible on the canal rather than on the railway.

"A railway company can practically divert traffic to their own route, not necessarily by charging more than, or even as much as, their authorized maximum rates, but by the imposition of terminal charges.

"To question the reasonableness of a terminal charge, a trader is compelled to resort to litigation with the railway company, or he must submit to their dictation. In witness's opinion terminal charges should be fixed by arbitration, and be re-adjusted from time to time upon the requirement of company or trader.

"Owing to the absence of competition between railway and canal in the Staffordshire Potteries the North Staffordshire Railway Company were until quite recently, enabled to maintain against the traders of the district the same tolls as were charged by the canal company nearly 100 years since; that is to say:

Earthenware -	$1\frac{1}{2}d.$ per ton, per mile.
Materials - -	$1d.$ „ „

"The effect was very different where there was real competition between railway and canal. For instance on the route from the Potteries to London the same earthenware, materials, &c., were charged by other companies as follows:—

	Earthenware.	Materials.	
Coventry Canal Company - -	$\frac{1}{2}d.$ - -	$\frac{1}{4}d.$	per ton,
Grand Junction Canal Company	$\frac{1}{2}d.$ - -	$\frac{1}{4}d.$	per mile.

"After repeated oppositions in Parliaments by the manufacturers of the Staffordshire Potteries, the North Staffordshire Railway Company have been compelled to make some reductions in the canal tolls.

"There is a great disparity in the rates charged by various railway companies in the United Kingdom for earthenware, *e.g.*,

	s.	d.	d.	
Staffordshire Potteries to London - - - - -	150 miles	30	0, or $2\frac{2}{6}$	per mile.
Newcastle on Tyne to London	275 „	23	4, or 1	„
Yorkshire to London - - -	170 „	20	0, or $1\frac{7}{17}$	„

"Does not know the rate from Worcester to London, but very little earthenware is sent thence, but principally china.

"The rates quoted are for ware packed in crates, collected and delivered by the railway companies; there are also rates from station to station.

"Is strongly of opinion that every manufacturing district should have two companies to treat with so as to ensure competition, *ie.*, either two independent systems of railway, or one system of railway with unfettered running powers for other companies upon such railway."

11,275. (*Capt. Galton.*) One of the principal points of which you complain in this statement is the high rate which you have to pay in comparison with the rate charged to other districts?—It is, and for a similar class of goods packed and treated in the same way as those which we manufacture.

11,276. Is that entirely in consequence of the charge made by the North Staffordshire Railway Company, or does it arise from the charges made by other companies in connexion with them?—It is almost impossible for us to ascertain that fact beyond a certain point, but we ourselves pay the carriage of our tiles to our different customers. We generally contract for completing a certain work, and I was enabled, through our invoices, to ascertain precisely what the charge made by the North Staffordshire Company was when their own line of rails was concerned, that is to say when they completed the contract upon their own railway, and I was enabled also to carry that out by comparing it when the goods went off their own line a certain number of miles on to another line. I will put in a table which was prepared for this purpose. We, in 1862, 1863, and 1864 promoted a line from the Potteries to Market Drayton in order to give us an independent connexion with the London and North-western and the Great Western railways. We thought by that means that we should be enabled probably to lessen the charges. This table, which I will explain to the Commission, gives first the names of places, the rate per ton, the mileage from Stoke, the North Staffordshire Railway Company's mileage, the rate per mile, and reference to invoices. I authenticated this tabie I may say by the North Staffordshire Company's own invoices. I find by this table that to Congleton the mileage from Stoke is 12 miles, that the rate per ton charged by the North Staffordshire Company is 7*s.* 6*d.* for the whole distance, which gives a rate per mile of $7\frac{1}{2}d.$ per ton; that is solely on the North Staffordshire railway. I may state that that is considerably in excess of the rate authorized by their Act of Parliament as we understand it.

The witness delivered in the following table:

TABLE of RATES for Carriage of Minton's Tiles from Stoke.

Names of Places.	Rate per Ton.	Mileage from Stoke.	N. S. R. Co.'s Mileage.	Rate per Mile.	Reference to Invoices.	Remarks.
	£ s. d.			d.		
Congleton ..	0 7 6	12	12	$7\frac{1}{2}$	31	N. S.R. solely.
Crewe	0 8 4	15	15	$6\frac{4}{5}$	2	Do.
Weston	0 7 6	14	14	$6\frac{1}{2}$	30	Do.
Burton	0 12 6	30	30	5	27	Do.
Macclesfield ..	0 8 4	20	20	5	33	Do.
Leek	0 10 0	24	24	5	25	Do.
Rugeley	0 12 6	23	19	$6\frac{1}{2}$	32	N.S.R. principally.
Chester	0 12 6	37	15	$4\frac{17}{37}$	7	Do.
Derby	0 12 6	37	30	$4\frac{1}{5}$	10	Do.
Manchester ..	0 10 0	38	20	$3\frac{1}{2}$	14	Do.
Nottingham ..	0 15 0	43	30	$3\frac{3}{4}$	11	Do.
Birmingham ..	0 12 6	46	11	$3\frac{1}{2}$	5	Do.
London	1 5 0	146	19	$2\frac{1}{16}$	1	N. S. R. slightly.
Bristol	1 2 1	140	11	$1\frac{13}{16}$	3	Do.
Hull	1 0 0	146	20	$1\frac{4}{5}$	12	Do.
Glasgow	1 15 0	245	15	$1\frac{1}{2}$	13	Do.

11,277. (*Capt. Galton.*) I suppose the North Staffordshire Company would say that a great proportion of that 7*s.* 6*d.* was due for terminal charges?—Yes. I am going to put in the North Staffordshire Company's explanation of this table of mine. I think that the explanation is not satisfactory; but it shows that under the present system the public have no guarantee against the charges that any railway company chooses to make, that is to say, that by the addition of terminal charges the charges per ton per mile may be run up to almost any amount that they think proper. Of course we have no remedy but that of an action at law.

11,278. The limit in the Act of Parliament for terminal charges is, that it shall be a reasonable charge, is it not?—There are very few Acts of Parliament in which the word reasonable I think will be found. I know it is not in the North Staffordshire Company's Act, because the question arose in reference to our toll. The North Staffordshire Company stated that we took power also to make terminal charges, but I pointed out to the counsel at that time that there was a very important word introduced in our terminal clause, which was that it should be reasonable, whereas that word was left out in the North Staffordshire Act; as far as any other Act of Parliament goes I cannot say whether the word is in or not.

11,279. (*Chairman.*) Can you tell what the maximum Parliamentary rate per ton per mile would amount to over that 12 miles which you have given as an instance?—Including the use of carriages and propelling power, the maximum rate is 3*d.* per ton per mile.

11,280. (*Capt. Galton.*) That would be 3*s.* instead of 7*s.* 6*d.*?—Yes.

11,281. The other 4*s.* 6*d.* would be for terminals?—Yes. In carrying this table out I may state that the mileage distances vary from 12 miles to 15 miles, 14 miles, 30 miles, 20 miles, 24 miles, and 23 miles. Those are instances where the traffic is entirely upon the North Staffordshire Company's line, and the mileage rate per ton to those places is $7\frac{1}{2}d.$, $6\frac{2}{3}d.$, $6\frac{1}{2}d.$, $5d.$, $5d.$, $5d.$, and $6\frac{1}{2}d.$

11,282. Supposing you deducted the sum of 4*s.* 6*d.* for terminals from each of those rates, would you not then arrive at a somewhat equal mileage rate?—I will give you the company's explanation of it as soon as I have gone through this table. We then come to where there is a small portion which belongs to what you may term a foreign company, that is to say, Chester. The mileage rate is 37 miles from Stoke to Chester, and the North Staffordshire Company have 15 miles of that.

The next I have taken is Derby, that is 37 miles from Stoke, 30 miles of which belongs to the North Staffordshire Company. Immediately we go to Chester the mileage rate is reduced to $4\frac{1}{18}d.$, to Derby $4\frac{1}{18}d.$ again, and to Manchester $3\frac{1}{6}d.$, and so, as we go on increasing the distance, say to Nottingham, Birmingham, London, Bristol, Hull, and Glasgow, we find the rates as you get a long distance upon the foreign lines reducing in this proportion, $3\frac{2}{3}d.$, $3\frac{1}{4}d.$, $2\frac{1}{18}d.$, $1\frac{2}{3}\frac{6}{8}d.$ $1\frac{2}{3}d.$, and $1\frac{2}{3}d.$ That, as compared with $7\frac{1}{2}d.$, the highest charge made by the North Staffordshire Company's mileage rate, is very considerable.

11,283. (*Capt. Galton.*) Are all those stations to which you get through-rates ?—Yes, all of them.

11,284. You get a through-rate to every station ?—Yes, to every station.

11,285. (*Mr. M'Clean.*) And do those rates include collection and delivery ?—Yes, collection and delivery; it is not delivery beyond probably a mile from the different stations, or so much.

11,286. But they include collection and delivery ?—Yes.

11,287. Have you the rates from station to station without collection and delivery ?—No; those would still be the same. Supposing a place is beyond their delivery, which in most of those instances it is in country places, as the houses where we have to lay floors are very frequently quite beyond their delivery, we have to cart it ourselves, but no difference is made in those cases in the charges.

11,288. Are they damageable goods, and do the company ensure against breakage ?—I do not suppose that we have ever made a claim for damage, and we have been in trade for a great number of years. But with regard to this particular class of goods they are tiles which are not very expensive in themselves, nor are they very easily broken, and they are much more carefully packed than tiles usually are; they are packed in crates and treated very much in the same way as other common earthenware is.

11,289. What is their value per ton ?—I cannot tell the value per ton; I can tell the value per yard. The value per yard averages from 6*s.* to 45*s.* per square yard.

11,290. (*Capt. Galton.*) Is that the value as laid ?—No.

11,291. (*Mr. M'Clean.*) And in case of breakage the railway company, I presume, is responsible ?—Yes, they would be responsible for any very serious damage. I have here an explanation by the North Staffordshire Company of the table which I have just read. They begin with Edinburgh, and they give Glasgow as well. The North Staffordshire terminals are 4*s.*, and other companies' terminals are 4*s.*, making a total terminal of 8*s.*

11,292. (*Chairman.*) Is that 8*s.* the terminal charge for one ton, or for a large number of tons ?—That is for one ton for two terminals, the North Staffordshire Company charging 4*s.* for their terminal, and other companies charging 4*s.* for their terminal, making 8*s.* the amount of mileage to Glasgow in division after the terminals are deducted, leaving 27*s.*, making the rate per ton per mile 1·22*d.*; the North Staffordshire Company's mileage out of the total charge for the transit over their portion of the distance, which is 15 miles, being 1*s.* $6\frac{1}{4}d.$ However they go through those different distances, and in every case they charge 4*s.* as terminals. In some cases the North Staffordshire Company take two, making it 8*s.*, and in one case, namely, to London, the terminals amount to 12*s.* 6*d.*

11,293. (*Mr. M'Clean.*) That is at the two ends ?—Yes, at the two ends.

I will now beg leave to hand in this table :

TABLE OF EXPLANATION given by the North Staffordshire Railway.

	Total Distance. Miles.	N. S. Railway Co.'s Proportion of Distance. Miles.	Rate per Ton for total Distance.	Cartage Terminals, N. S. Company	Cartage Terminals, Other Companies.	Total Terminals.	Amount for Mileage in Division after Terminals deducted.	Rate per Ton per Mile.	N. S. Co.'s mileage Share, including Use of Waggons.
From Stoke to—			*s.* *d.*	*s.* *d.*	*s.* *d.*	*s.* *d.*	*s.* *d.*	*d.*	*s.* *d.*
Edinburgh	260	15	32 6	4 0	4 0	8 0	24 6	1·125	1 $4\frac{3}{4}$
Glasgow	265	15	35 0	4 0	4 0	8 0	27 0	1·22	1 $6\frac{1}{4}$
Hull	146	30	20 0	4 0	4 0	8 0	12 0	1·	2 6
Bristol	140	11	22 1	4 0	4 0	8 0	14 1	1·2	1 1
London	146	19	25 0	4 0	8 9	12 6	12 6	1·07	1 $7\frac{1}{2}$
Birmingham	46	11	12 6	4 0	4 0	8 0	4 6	1·173	1 1
Nottingham	48	30	15 0	4 0	4 0	8 0	7 0	1·75	4 $4\frac{1}{2}$
Manchester	38	20	10 0	4 0	4 0	8 0	2 0	·631	1 $0\frac{1}{2}$
Derby	37	30	12 6	4 0	4 0	8 0	4 6	1·46	3 $7\frac{3}{4}$
Chester	37	15	12 6	4 0	4 0	8 0	4 6	1·46	1 11
Crewe	15	14	8 4	4 0	4 0	8 0	0 4	·25	0 $3\frac{1}{2}$
				N.S. Co.	N.S. Co.				
Norton Bridge	11	11	6 0	4 0	1 6	5 6	0 6	·545	0 6
Weston	14	14	7 6	4 0	1 6	5 6	2 0	1·71	2 0
					N.S. Co.				
Burton	30	29	12 6	4 0	4 0	8 0	4 6	1·78	4 4
				M. Co.	N.S. Co.				
Macclesfield	20	20	8 4	4 0	4 0	8 0	0 4	·2	0 4
Leek	24	24	10 0	4 0	4 0	8 0	2 0	1·	2 0

This table is rather a curiosity in itself. On looking at Macclesfield, which is 20 miles from Stoke, the rate per ton for the total distance is 8*s.* 4*d.*; the two terminals both going into the North Staffordshire Company's pocket amount to 8*s.*; the actual tonnage rate is a decimal of a penny per mile, and the total distance of 20 miles, they tell you here, that they perform for 4*d.* In my opinion, so long as the public are subjected to such an explanation of what the charges of a railway company are, and to a division of this sort, the public have no guarantee as to the rates that they will be charged. This table was made by the traffic manager, and put in to explain a table which I produced before the Committee of the House of Commons and the House of Lords, and there is no doubt as to its authenticity. You will see several instances of the kind that I have mentioned, where the actual labour, the actual haulage, is supposed to be done for little or nothing. You find by this table that the terminal charges always remain the same, but the actual haulage or carriage of goods varies for the same distance, or pretty nearly the same distance. Here, as to Macclesfield, they make out the haulage to be 4*d.* for the 20 miles, whereas to Burton, where the distance is 29 miles upon their railway, they get 4*s.* 4*d.* for haulage, and to Weston, which is 14 miles, they get 2*s.*, whereas to Macclesfield they only show that they get 4*d.*

11,294. (*Capt. Galton.*) Is Macclesfield on their own line ?—Yes; Macclesfield is on their own line. I may take another instance. To Norton Bridge, which is 11 miles, they only get 6*d.*, after deducting their terminal charges. To Crewe, which is 14 miles on their line, after deducting their terminals, they only get $3\frac{1}{2}d.$ for the whole 11 miles.

Mr. M. D. Hollins.

11 Jan. 1866.

11,295. Your argument from this is, that the statement is a purely fictitious one as to the division between terminals and locomotive charges?—I argue from this, that the public have no guarantee by the rates put down in any Act of Parliament, as to what the charges will be per ton per mile; that it is perfectly impossible for me or anyone else to take up an Act of Parliament, or to refer to the tolls which are hung up at their different booking offices, and to be able to say what expense I shall be put to for the haulage of certain goods per ton per mile.

11,296. (*Mr. M'Clean.*) Have you any difficulty in making contracts?—We are obliged before we can make contracts to make a special application to the railway stating the place and all the circumstances of the case.

11,297. (*Capt. Galton.*) Do you consider that to be very detrimental to the trade of the country?—Yes; I should certainly recommend that all terminal charges should be abolished, and that a rate per ton per mile, sufficient to cover them should be instituted instead; there are no terminal expenses upon passengers.

11,298. But would not it be a simpler process that the terminal charge should be fixed, as the maximum mileage charge is at present fixed, by Act of Parliament?—I think it would not be so satisfactory, simply because branch railways would always claim two terminals, or might do so, and the other company might claim two, and if the traffic went upon three lines you might have six terminals.*

11,299. Could you ever have more than two terminals if they were compelled to book through?—Not if they were compelled to book through; but you see they are not all compelled to book through.

11,300. But if you were going to amend an Act of Parliament, do not you think that it would be a more simple process, and a fairer system for the railways to compel through booking, and to limit the charge for terminals rather than to make a fixed mileage charge?—That I should prefer; it would then be equally in the knowledge of all parties contracting.

11,301. What you want to take place is that any person should be able to go and look either at the company's table of rates or at the Act of Parliament, and see what was the maximum sum that he might be called upon to pay before he made the contract?—I do.

11,302. I presume you would not take away from the company the power of charging a less sum than the maximum rate which Parliament had fixed if they chose to do so?—No.

11,303. Do you consider it desirable that a railway company should publish such contracts as it made below its maximum rates, so that all the traders in the district might know them?—I should abolish differential rates. I think that the power which the railway companies have now of charging differential rates is very objectionable.

11,304. In what respect is it objectionable?—Because it has a tendency to take off the direct course traffic, which probably, under other circumstances, would and ought to belong to another railway company. Of course if you instituted a preliminary regulation that all traffic must go by the shortest and most convenient route, the objection that I have stated would not then act so strongly. But still, if a company, as we have known them to do, will book passengers, and I can name one instance from Chester to Shrewsbury, along the London and North-western line, going by Stafford, and then from Stafford to Shrewsbury, and will book them from Shrewsbury for less than they will book passengers to Stafford, it naturally follows that the company must make more profit than they ought to do by the passenger that goes to Stafford, or they would be losing by the passenger that goes to Shrewsbury; and I think it is unjust that when they are losing by that operation, the passenger that goes to Staffordshire should pay for that loss.

11,305. (*Chairman.*) Is it not quite in the power of a passenger going to Stafford, if he is aware that there is such an arrangement, to take a ticket to Shrewsbury, and give it up at Stafford?—No. That was decided in a case that was tried by a gentleman going from Chester, and it was given against him.

11,306. (*Capt. Galton.*) You would object to a company charging between any two places a less sum than it would charge for passing between one of those places and a place intermediate to the two places?—I would.

11,307. If they chose to take a very low fare between any two places you would require that they should carry a passenger between the one place and any intermediate place at a not higher charge?—At a not higher charge. And whatever rate they fixed for certain goods to be carried along any portion of that line, it should be in the power of any other trader to compel them to carry the same goods for him at the same rate.

11,308. (*Chairman.*) For the same distance, or for a shorter distance?—For a shorter distance either.

11,309. Suppose a case of this sort. A company carries goods, say from London to Edinburgh, at a low rate, in order to get traffic competing with the sea route, would you consider it obligatory upon that company to carry to a town within 20 miles of London at the same rate per mile?—Yes, at the same rate per mile.

11,310. The effect of that would be that the companies, not being able to afford to carry for the shorter distance at that low rate, would be obliged to abandon the through traffic to Edinburgh, would it not?—I think not. Perhaps in some cases it might be objectionable, but I think that the arbitrary power given to fix arbitrary rates is so injudicious that it leads to traffic being taken by one railway which legitimately belongs probably to another railway.

11,311. (*Mr. M'Clean.*) In what sense do you mean "legitimately"?—Because it is the most direct route for that traffic to take, and because the other railway companies offer to take it perhaps a greater number of miles round even at a less rate than the first company are disposed to take it, and the traffic is diverted from its legitimate course, and the shareholders of the company of course become losers in consequence, and if the very low rate at which in many cases it is taken, does not pay the company that takes it, why should they at a loss to themselves, or at a very small rate of profit, take away what legitimately belongs to some other company?

11,312. Then are you of opinion that a railway company should always charge its maximum mileage rate to the public?—I would rather that they should be obliged to charge their maximum rates than that they should be allowed to charge differential rates arbitrarily.

11,313. How is the public injured by differential rates?—We will suppose two traders manufacturing the same class of goods.

11,314. In the same district?—No, not in the same district, but in two districts. In the case which I have put in my preliminary statement, that of a manufacturer of earthenware in the Staffordshire Potteries, I am 130 miles from London, and I have to pay 30*s.* for the carriage. Newcastle-upon-Tyne is 275 miles, and they pay 23*s.* for the total distance, and in Yorkshire, which is 170 miles, they pay 20*s.* Supposing that on the railway from Newcastle-upon-Tyne there was a manufacturer situated 100 miles nearer to London than Newcastle-upon-Tyne, but on the same line of railway, and he was to be charged for that 175 23*s.*, I should think that was a great hardship.

11,315. But how is the public injured?—The manufacturer is injured.

11,316. But is the public injured; does not the consumer gain?—The public is injured in this way, that if the manufacturer was charged less, which he ought to be if the charge for the long distance is a fair charge, he would be able, of course, to sell whatever he had to sell at a less rate.

* If terminals are to be a fixed charge, the duties to be performed ought at the same time to be defined.

11,317. Taking the other view, if the maximum rate were charged to both, the public would be excluded from the benefits arising from the competition from Newcastle?—To a certain degree they would.

11,318. So that the injury would be to the public?—To the consumers; but still there would be justice, perhaps, to the manufacturers.

11,319. (*Capt. Galton.*) In the case of the Newcastle traffic, if it had to be charged the maximum rate by the railway company, would it not go by sea; and is not the reason why there is that low charge of 23*s.* from Newcastle to London, because the traffic can go by sea?—No doubt it is; in many instances where you get the competition of railway and canal you get a lower rate.

11,320. And in Staffordshire, where there is no competition, you get a high rate?—We get a high rate. I may state with regard to Staffordshire, that before the Grand Junction Railway, which is now the London and North-western, was finished and opened, the charge for earthenware to London per ton was three guineas; now it is 30*s.* In consequence of the competition between the canals and the railway it was reduced to 35*s.*, and it has lately been reduced to 30*s.* But, on the other hand, to Liverpool the rate remains very nearly the same. I do not know that there has any reduction taken place at all, although we have both railway and canal communication to there.

11,321. But are the railway and the canal communication in competition?—No; the railway and the canal, from the amalgamation of the Trent and Mersey canal with the North Staffordshire Company, are in competition so far as this, that they carry by canal, and, they having 30 miles of canal against only 15 miles of railway, it is their object to keep the traffic upon the canal instead of letting it go on to the railway, and they do this by imposing high tolls up to the junction with the London and North-western railway.

11,322. But so far as I understand the North Staffordshire Company have bought the Trent and Mersey navigation?—Yes.

11,323. It does not matter to them whether they make their profit upon the Trent and Mersey navigation or whether they make it on their own railway; they have to pay 5 per cent. upon the purchase money; is not that it?—They have to pay 5 per cent. upon the purchase money, but it matters to them inasmuch as this, that if the traffic is taken off their canal and put upon their railway, they have only 15 miles of traffic on their railway against 30 on their canal, consequently they lose in the mileage rate and the total amount.

11,324. It is their interest to force the traffic on the longest mileage?—Yes, on to the canal, and they do so. The greatest portion by far, nearly all I may say, of the goods manufactured go by canal to Liverpool, and the materials come by canal to the Potteries, whereas to London nearly all the goods go by railway.

11,325. What remedy would you propose for that state of things; the railway company charge, I presume, something less, not more at all events than their maximum Parliamentary rate?—They bring it up with terminals.

11,326. Are there terminals on the canal?—There are no terminals on the canal.

11,327. The tolls upon the canal are fixed by Act of Parliament, are they not?—Yes, they are fixed by Act of Parliament; but the difference between the railway and the canal is simply this, that I can put my own boat upon the canal, pay their tolls, and use their wharves to a certain extent, without any extra charge. I know exactly on the canal what the cost will be. The North Staffordshire Company, in order to keep their traffic upon their canal, as I said before, charge a high rate on the railway up to its junction at Crewe. The London and North-western Company will bring our clay to Crewe from Birkenhead for 4*s.* I suppose that is a distance of nearly 40 miles, and the North Staffordshire Company charge for the 14 or 15 miles between Crewe and Stoke 3*s.* 4*d.*, making the charge together 7*s.* 4*d.*, which is the same amount that it would be if the trader brought it by the canal. As the conveniences to the traders and the facilities for the transmission of the clay on to their works are better by the canal than by the railway, the consequence is that the traffic is kept upon the canal and does not come to the railway.

11,328. What is the value of a ton of clay?—It varies from 30*s.* to 50*s.* Flints, which are charged at exactly the same rate, do not average more than 21*s.*, delivered in the potteries.

11,329. (*Chairman.*) Assuming that what you suggest were to be carried out, namely, that there should be a uniform mileage rate all over a line of railway: And further assuming the railway from Newcastle to London to be in the hands of a single company, must not that company reduce their rates per mile on the shorter distances to what they now find they can, carrying in competition to the sea route, just afford to charge from Newcastle to London; and in that case would there not be a considerable loss of dividend to the shareholders?—Of course, if it was reduced to too low a standard.

11,330. Supposing that that loss of dividend to the shareholders took place, or that the shareholders in the railway companies anticipated that such a loss of dividend would take place, would it not be likely that they would choose the other alternative of giving up the traffic that they might get by their lower charges for long distances and continue to charge higher rates as they do now for the shorter distances?—I think it is very probable that they would, but I consider that it is unfair that those who from the circumstances of their position are obliged to make use of a short distance of their railway and have it not in their power to make use of the longer, should be made to pay for any loss that may accrue from those that use the long distances.

11,331. Would not the effect of that be this, that at Newcastle the railway company, not being able to afford any longer to carry traffic in competition with the sea route, the whole of it would go by sea, and there would be no competition with the sea route, and the public would be injured by the owners of the vessels carrying that traffic raising their charges?—Yes, that is possible.

11,332. (*Mr. M'Clean.*) You state in your preliminary statement, do you not, that you are of opinion that every manufacturer in a district should have two companies to treat with so as to ensure competition?—Yes, that he should have two companies to ensure competition, or that other companies should have the power of running into the district unfettered.

11,333. What is the object of competition here; is it to ensure low rates?—Not to ensure too low rates, but to keep those rates at a fair and reasonable amount. I have shown, I think, by the table which I have put in, that we are subject to very high rates in comparison to what we are subject to on other lines of railway.

11,334. (*Capt. Galton.*) You have shown that in certain portions of North Staffordshire your own rate is a very low rate where there is no competition, and that on other parts of the line where there is equally no competition the rate is a very high rate?—Yes, a very high rate.

11,335. (*Mr. M'Clean.*) Why should you deprive Newcastle of the benefit which it derives from competition?—It would not be deprived of that benefit by our being charged a fair rate. We are, I consider, as a district, in a better position to deal with London than Newcastle is, inasmuch as we are 100 miles nearer.

11,336. The competition you wish to be for the benefit of the manufacturer, and not of the consumer?—I do not think that it can be for the benefit of the manufacturer without the consumer receiving a certain amount of benefit, because whatever leads to the reduction of the manufacturer's expenses there is no doubt the public sooner or later get the benefit of.

11,337. Is not it so with the Newcastle low rate, that the public get the benefit?—Yes, the public get the benefit of that; not in competition with me, because I cannot compete with them. The pottery district used to furnish all the common goods to London, but owing to the high rates which we pay now and the low rates which the Newcastle manufacturers pay, we cannot in the Potteries compete with those manu-

Mr. M. D. Hollins.

11 Jan. 1866.

facturers; therefore the public does not get the benefit of the competition between the Staffordshire Potteries and the Newcastle Potteries. I have not got the tables with me here, but I put them in evidence before the Committee of the House of Commons. It makes a difference of something like 8 per cent. upon common goods which used to be made and used to go from the Staffordshire Potteries.

11,338. (*Capt. Galton.*) That took up a great part of the profit, I presume?—In some instances, I should say that 8 per cent. is more than the profit of the manufacturer.

11,339. In fact, your complaint now is very much the same that the South Staffordshire ironmasters made a short time ago, namely, that they were charged a higher rate from Birmingham to London for iron than was charged from Middlesborough to London. Are you not aware that they made a representation to the railway companies, and that they have had that rate subsequently modified in consequence?—I am not aware of that. We have got our tolls reduced by our application to Parliament for the line of railway that I have mentioned. On our withdrawing that line the North Staffordshire Railway Company entered into an agreement with us that the tolls on the 1st of January 1868, should be reduced on manufactured goods one third, and upon materials one half, but we got that after three years hard fighting.

11,340. You did not get your railway?—We had to withdraw our railway to get that as a substitute for it, and we were induced to do that in consequence of the position in which we were placed. We had made a certain engineering mistake, not complying with the Standing Orders, and the House of Lords declined to waive them. The House of Commons did waive them, and our Bill was read a third time in the House of Commons, but though we could not proceed further, it was quite evident that the Committee would have passed our Bill, and rejected the North Staffordshire Bill, and the North Staffordshire Directors seeing that to be the case, were induced to offer those terms, and I took those terms in behalf of the district, knowing that we could not proceed further that year.

11,341. (*Mr. Gower.*) How many attempts have you made to introduce a competing line into the Staffordshire Potteries?—Four.

11,342. In what way have those four attempts been defeated?—By the opposition principally, we have been inclined to think, of the landed proprietors in the district.

11,343. How often have you passed the Committee of the House of Commons?—Three times. I may say three times, because virtually last time we should have done so; twice we passed, and twice we appeared before the House of Lords.

11,344. Do you propose to renew the attempt?—No, I think not, at present.

11,345. Supposing any of those lines had been passed, is it your opinion that the grievances of which you complain would have been remedied?—I am quite sure that they would.

11,346. Do you not think that a competing line is the proper remedy for those evils?—I think that in the present position of railways without any sort of control, nothing but a competing line will insure the public the attention and the proper charges which they ought to have.

11,347. (*Capt. Galton.*) You state that railway companies are without any control; what control do you think could be placed over the railways, having due regard to the fact that they are commercial undertakings?—In the first place I think that in considering that subject we have to take this into consideration, that Parliament has virtually granted to certain large companies, you may say certain districts, over which they have a monopoly.

11,348. Is that practically the case?—I think you may take it that it is generally so.

11,349. Has not the London and North-western Railway Company competition at every point almost?—So it may have, but still if any company were to attempt to come before Parliament and say, We are prepared at our own expense and at our own risk to make a line of railway between Liverpool and London, no Parliamentary Committee, I believe, would be ready to grant it. Therefore they are, to a certain extent, under Parliamentary protection; I think that that cannot be disputed. There is a sort of Parliamentary protection which railways at the present time enjoy, and if they enjoy that protection, I think that the Government have a perfect right to say, We must have you under some sort of control.

11,350. (*Chairman.*) But in practice what is there to prevent Parliament granting a new line from Liverpool to London?—Nothing; but we know that it would be perfectly futile for any company to go to Parliament and ask for it.

11,351. Was it not the case last year that, there being already three lines between two of the most important towns in England, Liverpool and Manchester, the Committees of both Houses, after a long inquiry, granted a fourth line?—I think hardly running parallel; they were connecting some of the small manufacturing towns round Manchester; they could hardly run in the same direction in which the first Liverpool line ran, which was almost straight between Liverpool and Manchester, quite irrespective of any manufacturing districts; it did not pass through any manufacturing district, it even avoided all large towns and all large property, going as direct as it could through unimportant places merely to connect Liverpool with Manchester.

11,352. (*Capt. Galton.*) Has not the Midland Railway Company recently obtained an Act for a line from Bedford to London, running almost parallel side by side with the Great Northern Railway?—Yes; but I think that the public were entitled to that, because the Midland Company had no independent means of getting into London.

11,353. Were not they originally formed as a railway not to be connected with London at all?—They were; but when you find that those railways with whom they became connected were unable to render them that accommodation which they were entitled to, (in fact it would have been probably dangerous to the public to have done so,) then I think that Parliament was perfectly justified in saying, You have traffic sufficient to entitle you to a separate and distinct entrance to London from that of the London and North-western Company.

11,354. And are they not equally applying this session for a line parallel to the Lancaster and Carlisle railway, which will take them to Glasgow?—I am not aware of the different lines that were proposed.

11,355. (*Mr. Gower.*) As I understand you, you were defeated in your application to Parliament by the opposition of the landowners and not by the opposition of the North Staffordshire Railway Company?—Certainly, the opposition of the North Staffordshire Company themselves, I believe, had no weight at all; it had certainly none in the House of Commons, and I believe it had very little weight in the House of Lords. There is no doubt Lord Crewe opposed us, giving an alternative line, but he said that if it was brought forward in another year according to the plan which he laid down he should not oppose us. Parliament thought that it was only fair that that should be done, and we were deferred for anther year. Upon that we have had the very same contest in the House of Commons, and we passed that House and came again before the House of Lords, but in avoiding Lord Crewe or in carrying out his suggestion, we had interfered with Mr. Sneyd to a greater extent than we did before, and he was under a contract with the North Staffordshire company to oppose any line which they asked him to do passing through his property. He of course was bound by this deed to do so, and we were again thrown out upon those grounds.

11,356. Then, as I understand you, on the last occasion it was the interest of the North Staffordshire Railway Company that defeated you, through Mr. Sneyd?—Yes, through Mr. Sneyd.

11,357. (*Chairman.*) Assuming that your suggestion was adopted, that uniform mileage rates should be carried out in all parts of the country, would you have the rate according to the number of miles run over each line, or would you have the shorter distance govern the rate; that is to say, that the longer line should only charge the same gross sum as the shorter line. Take, for instance, the lines from Birmingham to London; would you say that the charge from Birmingham to London by way of Oxford and the Great Western line should be the same gross charge as from Birmingham to London by way of Rugby and the London and North-western line?—No, I should make it a mileage rate, that is to say, if it was 150 miles one way and 160 miles another it should be so much per mile per ton, so that the distance would then govern the total charge; otherwise, of course, it would be just the same as we have now; in case of wanting to consign a package anywhere by railway you would have to apply to know what the actual rate of the company would be.

11,358. Then if it were the case that the companies were bound to charge a certain sum per ton per mile according to the number of miles run over, would it not in the case of traffic going from Birmingham to London amount to this, that all the traffic would go over the London and North-western shorter route, and that none of it would go by the longer route by Oxford and the Great Western?—I should think there is no doubt about that.

11,359. Then what becomes of the competition?—The competition would still remain, because it is only the maximum rates that I suggest should be fixed, a uniform maximum rate.

11,360. But that you have fixed now, have you not?—No; the maximum rate is not always the same upon all railways, and what I wish is to include the terminal charges, which I think are a great objection to railways.

11,361. What I understood you in the former part of your evidence to say was this; that in case a railway company for their own profit find it to their advantage very materially to lower their rate from a place at a long distance from London, like Newcastle, they should be bound to carry the shorter distance on their own line at the same rate?—Yes.

11,362. You do not apply that to all lines in the kingdom, do you?—No: each company choosing voluntarily to reduce their maximum rates fixed by their Act of Parliament must not do that as regards one of the trade without doing it in the same way to others. That is not a new law; that is a law which existed until a few years ago upon all canals; no canal company could charge one set of tolls to one trader and another set of tolls to another, whether he went five miles or 20 miles, and I cannot see why it should not be so on a railway.

11,363. (*Capt. Galton.*) But do not canals do it now?—Yes, because there was an Act passed; I believe it was the General Railway Act which gave them the power to do so.

11,364. Is that the extent of the control that you would adopt over railways in order to mitigate the evils which you have been pointing out?—No; in the first place I should put all railways under a Government Board for the general regulation of railways, with power to enforce such regulations as they thought proper.

11,365. To what extent would that board regulate the railways?—I say a Government Board for the general regulation of railways, with power to enforce such regulations as they may think advisable for the public safety and convenience, and to have the entire control over railway traffic generally; all goods and passengers to be forwarded by the nearest and most convenient routes; uniform rates both for goods and passengers to be charged upon all railways; terminal charges to be abolished, and mileage rates fixed to include those; in case of a railway company being called upon to perform any extra duty at a terminus, such duty to be a matter of contract between the parties; differential rates to be done away with, and all railways to be obliged to charge the same rates per mile for all goods and passengers, whether for long or short distances, on their own railways; that railway companies should be compelled to run a certain number of trains per day in connexion with other trains on lines branching out of their line; that is with regard to passenger traffic, and that all railways should be obliged to book through.

11,366. You say that you would abolish terminal charges, and make railway companies carry at a uniform rate per mile, whether for a long distance or a short distance?—Yes, on their own lines.

11,367. We will take the case of traffic which has to go 100 miles, and traffic which has to go 10 miles; would not the cost to the railway company of shunting and making up the train and putting the waggons into the sidings, and everything of that sort, be a much larger proportion of the whole sum paid for the traffic which went the 10 miles, than it would be for the traffic which went the 100 miles?—Yes it would, and probably the suggestion that I made of a fixed terminal might be better, but I think there should never be more than two terminals charged. In the case of a railway branching from another, I think that it should not be considered a terminal.

11,368. Do you consider now that it would be a just thing upon railway companies to subject them to this new control that you are speaking of, without giving them any compensation for it?—I think it would be quite just.

11,369. Although you do not in any way alter the competition to which they are subjected?—I do not think that anything I have named calls upon them to do more than they perhaps contracted to do by their Act of Parliament.

11,370. You would give this Government Board great powers over their tolls, as I gather?—No, not over their tolls.

11,371. Unless they reduce their tolls voluntarily to begin with?—Yes, unless they reduce their tolls voluntarily to begin with.

11,372. You would allow them to charge their maximum tolls if they chose, but if they did not choose to charge their maximum tolls over one portion of their line you would not allow them to charge them over another portion?—Just so.

11,373. (*Chairman.*) And is it to be at their own option whether they can after a time raise those tolls, or would you make this Government Board a sort of referee to decide whether they should have the power of doing so, or not?—No, I do not propose, and I do not think that it would be just to interfere with any powers that are given to them in their Act of Parliament, but as terminals are treated by all the Acts of Parliament in what I call a very indefinite way, and in which it is quite impossible to state whether it is fair for them to charge one sum or another for the duties performed as to terminals, I think it would be quite reasonable that Parliament should at once regulate those charges in any way that they might think advisable.

11,374. (*Capt. Galton.*) And you do not think that it would be advisable that a railway company should charge to a trader who can supply them with a very large amount of traffic, a smaller mileage rate than they charge to a trader who can only send them a very small quantity?—I do not think it is quite fair to the other trader; he has to meet the large trader in competition; he is a small trader, and he trades to the utmost of his means; whereas, the other man has ample power to compete with him, from the very circumstance of his being a large trader, without any

Mr. M. D. Hollins.

11 Jan. 1866.

of the facilities and advantages which a railway company might give him.

11,375. Do not you yourself sell goods to large purchasers at a lower rate than to small purchasers?—No.

11,376. Is not that the custom with a great part of the commercial community?—It may be, but I think to a very small extent; I do not think it is so as a rule.

11,377. (*Mr. Gower.*) Do you think it is fair upon persons who have expended capital in establishing potteries at Newcastle upon the faith of their having only a small rate to pay for the carriage of their goods, that the rates should be raised, so that their business may be greatly injured?—Provided the rates are not raised above what the Act of Parliament allows the railway companies to charge, I do not think there is any hardship upon them. They have only, in all probability, used the railways because the railways have competed and offered them greater facilities than the shipping trade has done.

11,378. (*Capt. Galton.*) They have no guarantee, have they, that the railway company will not charge them their maximum rates?—None whatever.

11,379. And they have established their warehouses and manufactories with the chance of being charged the maximum rate?—Yes, and many of them before railways were made.

11,380. (*Chairman.*) Do you hold the same opinion with regard to uniform rates being charged to passengers as you do with regard to goods?—Yes, exactly the same. I should apply the same principle to the one that I apply to the other.

11,381. I think it is in evidence, that in the neighbourhood of some manufacturing towns, the railway companies charge very low rates for certain short distances. Would you compel them to charge those low rates over the whole of their system because they found that, from the enormous amount of traffic that they had in those particular districts, they could afford to carry at these low rates?—I think that exceptions might be made, and, of course, as far as contract tickets went, they would be, more or less, infringements of any general rule of that kind. But all that would be matter of detail, which would require a very considerable amount of consideration.

11,382. (*Capt. Galton.*) How would you admit any exceptions unless you give power to this Government Board to deal arbitrarily with the tolls?—It might be necessary to give them a certain amount of power of that kind; I do not see any objection to that.

11,383. Would not that be interfering very largely with the railway companies who have invested their money in their undertakings upon the faith of no interference?—But I do not see how they could do that, they could have no guarantee in the matter. I think that the Government would be bound if necessary to pass such regulations as they might deem advisable for the good and convenience and safety of either passengers or goods travelling upon any line.

11,384. (*Chairman.*) Do not you think that it would be almost impossible with regard to passenger fares to apply such a rule as that; though it might be very profitable for a railway company to carry passengers at a very low rate in a very densely populated district, do you think that the rule should be applied to a very thinly peopled agricultural district, where, if they were obliged to carry at those very low rates, they might possibly not be able to cover the working expenses of their trains?—Instances of that sort may arise, but still I should think that there are few railway companies who had not estimated before they even applied for their Act of Parliament what their traffic was likely to be, and had based their charges or their maximum rates upon that.

11,385. But estimates are sometimes wrong, are they not?—Yes, so they are, but I do not propose that the maximum rates of any line should be decreased. The maximum rates should still remain in power in any Act of Parliament that exists at present, but if they charged one party lower upon their line for certain work performed, they must perform the same sort of work for anyone else at the same price.

11,386. Even although it might be very profitable to them to do it in one part and so unprofitable in another portion of their system that they could not cover their working expenses?—Yes, because they have brought it upon themselves by doing it at too low a rate for the other parties. If they kept up their maximum tolls, there is no doubt that if their calculations have been made correctly they could perform the service, if their calculations have not been made correctly still it is the fault of the company and not the fault of the public.

11,387. (*Mr. Gower.*) To go back to the opposition of Mr. Sneyd to your last proposal for a line, can you state whether the fact that that opposition was in consequence of a contract with the North Staffordshire Railway Company was known to the Committee of the House of Lords that rejected the Bill?—I could not state that.

11,388. From your experience of Parliamentary Committees on Railways, should you say that they are actuated by a great variety of principles in the decisions that they come to?—I think there is no doubt about that.

11,389. Do you not think that it would be very desirable that they should have some general principles which they should uniformly adhere to?—I think that the duties at present performed by the different Committees of the House of Commons might be equally well performed by a Government Board, and with far less cost than is at present incurred by the country. In fact, I do not believe that there is any person but those who are intimately acquainted with the affairs of different railway companies, who has any idea what money the larger companies and even many of the smaller ones have expended in railway contests, in what they term "protecting their property." If I am informed correctly, (and it seems to be carried out by the published Reports that I have examined,) all the law expenses incurred in protecting their property against the invasion of another company are charged to capital; upon what principle I certainly do not understand. Of course if that is the case, and we know what enormous sums have been spent, that capital cannot yield any profit, and of course that accounts in some way for the dividends of many companies being so very small, and I think that some means ought to be adopted by which that large expenditure could be saved to the country.

11,390. (*Chairman.*) How would altering the nature of the tribunal before which those cases were to be heard and determined prevent railway companies protecting their interests against invasion?—It is a difficult question to go into, and I do not know that I am prepared to go into it.

11,391. (*Mr. Gower.*) Would not a tribunal where a greater certainty existed as to the decision than exists in the present tribunal, obviate a great deal of litigation?—I think so, and I think that the difficulties might be lessened and the contests shortened very much by some previous inquiry as to the rights of certain opposition, whether it ought to be heard or not. With regard to the opposition which those large railway companies have taken upon themselves to make against small lines, which have been projected for the accommodation perhaps of some local district where they thought it might injure them, I think that they ought not to be heard in such cases.

11,392. (*Capt. Galton.*) Would you exclude all opposition by existing companies to new companies, on the ground of competition?—No, I should not exclude all opposition, if they could show some real and clear grounds beyond the simple ground that the new company would probably abstract from them some of their traffic.

11,393. Do you believe that any tribunal short of

the highest tribunal of appeal would satisfy those large railway companies, if they were excluded ?—I dare say they would make a very strong objection to it.

11,394. Is not it so material a part of the inquiry, that it would be necessary that their arguments on their claim to be heard, should be decided upon by the same tribunal that decided upon the case itself ?—No; I think that certain rules might be laid down by which certain oppositions should be allowed, and in other cases should not be allowed; in fact, to a certain extent, that is the case now, and I think that it might probably be carried further than it is. I do not know the exact extent to which it goes.

11,395. (*Chairman.*) Would you, in constituting this court which you propose, allow any appeal from it, in case either party were dissatisfied with its decision ?—That, again, would be a matter of detail for consideration. I should myself not be inclined to allow it, as it would rather lead to the expenditure of public money in an objectionable way.

11,396. Do you think that Parliament is likely to delegate its authority to another tribunal ?—Is your Lordship speaking now of the Committee which I propose for the general management of railways ?

11,397. I am speaking of the Committee which you propose in place of the Committees of the Houses of Parliament ?—That is another matter which I am hardly able to deal with; probably Parliament might not be willing to do so.

11,398. Is there any other matter which you wish to lay before the Commission ?—I have a table showing the tolls charged by the various canal companies between London and the Staffordshire Potteries. The object of that table is to show that while the canal companies to the south have reduced their tolls largely owing to the competition of the London and North-western railway, the Trent and Mersey Canal Company have not reduced theirs.

Mr. M. D. Hollins.

11 Jan. 1866.

The witness delivered in the following table:

Table showing the Tolls charged by the various Canal Companies between London and the Staffordshire Potteries

Name of Company.	Route.	Miles.	Rate per ton per Mile. Flints, &c.	Rate per ton per Mile. Earthenware.
			d.	*d.*
North Staffordshire Railway Company.	Stoke to Fradley -	30½	1	1½
Coventry Canal Company.	Fradley to Whittington Brook.	5½	½	½
Birmingham - -	Whittington Brook to Fazeley.	5½	1	1
Coventry - - -	Fazeley to Longford -	22½	½	½
Oxford - - - -	Longford to Braunston	24	5/12ths of 1*d.*	5/12ths of 1*d.*
Grand Junction - -	Braunston to Paddington.	101	¾	½
	Total distance -	188½	Miles.	

	Flints, &c.	Earthenware.
Thus, the Grand Junction Canal Company, for 101 miles, take only per ton - - - -	*s. d.* 2 1¼	*s. d.* 4 2½
While the North Staffordshire Railway Company, for 30½ miles, take - - - -	2 6½	3 9¾

Applying these figures to a boat load of flints, &c., the rates work out thus:—

	£	*s.*	*d.*
Present tolls, per boat load of 20 tons -	6	10	5
But if charged throughout at the North Staffordshire Railway Company's rates, would be - - - - - - -	15	14	4½
Whereas, if charged throughout at the Grand Junction Canal Company's rates, would be only - - - - - - -	3	18	7

N.B.—The above Table is based on the rates charged previous to the reduction made in November 1862. Since that month, the North Staffordshire Railway Company have reduced their canal tolls between London and the Potteries 33⅓ per cent.; but the Grand Junction and Coventry Canal Companies have also (notwithstanding their previous low tolls) reduced their tolls 33⅓ per cent.

The witness withdrew.

Adjourned.

Tuesday, 13th February 1866.

PRESENT:

The Right Hon. The Earl of Belmore.
The Right Hon. Lord Stanley, M.P., F.R.S.
The Hon. E. F. Leveson Gower, M.P.
The Right Hon. Robert Lowe, M.P.
Sir Rowland Hill, K.C.B., F.R.S.
T. B. Horsfall, Esq., M.P.
Robert Dalglish, Esq., M.P.
Geo. Carr Glyn, Esq., M.P.
Capt. Douglas Galton, R.E., C.B., F.R.S.
E. T. Hamilton, Esq., M.P.
J. R. M'Clean, Esq., Pres. Inst. C.E.
William Pole, F.R.S., *Secretary.*

His Grace THE DUKE OF DEVONSHIRE, K.G., F.R.S., in the Chair.

William Cawkwell, Esq., examined.

W. Cawkwell, Esq.

13 Feb. 1866.

11,399. (*Chairman.*) You are general manager of the London and North-western Railway ?—I am.

11,400. You are able to supply the Commission with information, both as to the principle and the details of the system on which the traffic of that railway is carried on ?—Yes, I think I am prepared to do that.

11,401. Have you had an opportunity of looking at the evidence which has been given before the Commission by the witnesses from Liverpool and other towns ?—I have.

11,402. Will you be so good as to furnish the Commission with any explanations which you may think proper to give, first, with respect to Mr. Clark's evidence from Liverpool. The general nature, I believe, of the complaints is that Liverpool is unfairly burdened with charges as compared with other towns ?—Yes, I take that to be the purport of Mr. Clark's evidence, that is, he considers that the rates and charges from Liverpool are higher per mile than from any other places that he names, and perhaps it would be as well if your Grace would permit me to follow the order in which I have put them down in this printed form which I have before me, and I will give any further explanations that may be necessary, and answer any questions as the examination proceeds. First of all, Mr. Clark states that the rates from Liverpool to places inland are higher than from the eastern ports inland, and he instances chemicals from Liverpool to Hull as being charged 15*s.* per ton, whereas from Newcastle to Hull the charge is only 8*s.* That, no doubt, arises from the fact of there being an open sea competition between Newcastle and Hull, and if the railway companies are to carry the traffic at all, they must carry at or near the same prices as those at which the article is carried by sea. That causes the extremely low rate between Newcastle and Hull, but still the rate from Liverpool to Hull is not at all an unreasonable rate. Then he instanced timber from Liverpool to Preston and from Fleetwood to Preston. That arises in a similar way, namely, that Fleetwood is a new port, and a trade has been endeavoured to be created there. It was found that unless the Preston portion of the cargo was taken at a very low price the vessels could not be induced to come into Fleetwood; therefore, for a certain portion

W. Cawkwell, Esq.

13 Feb. 1866.

of the cargo which goes to Preston, the companies take it at a very low price, the remainder of the cargo going forward to the different towns upon the line, to Blackburn, Bolton, Manchester, and any other places upon the railway; but that is the reason why there is so low a rate between Preston and Fleetwood, the navigation being entirely free.

11,403. (*Capt. Galton.*) Where does the timber come from?—It is foreign timber, American timber, or from any other ports brought into Fleetwood.

11,404. Are the shipping rates higher from America to Fleetwood than they would be from America to Liverpool?—I should think they are about the same. I do not know of my own knowledge, but I should think they are much the same.

11,405. What is the exact object of putting a low rate on the timber from Fleetwood; is it to induce the vessels to go there?—It is to induce the vessels to go to Fleetwood.

11,406. (*Mr. Horsfall.*) Why should the London and North-western as a railway company desire to induce vessels to come to Fleetwood?—They have a railway to Fleetwood, they have spent money in forming a port there, and of course they are anxious to get traffic.

11,407. (*Lord Stanley.*) You admit the principle that where there is competition you will carry at the lowest rate which is compatible with making any profit, and where there is no competition you will carry at the highest rate that is compatible with not driving off the traffic?—No doubt. In fact companies hold themselves quite justified in some cases in reducing their rates to meet competition, and in other cases they get what will fully develop the traffic.

11,408. (*Capt. Galton.*) Is not the result of that to the public that the people who live in towns where there is no competition have to pay high in order to enable the company to carry almost unremunerative traffic between places between which there is competition?—I know very few places where there is not competition of some kind or other, but it does this,—it enables the public to buy in a great many markets, whereas the other principle would confine them to one particular market, that is to say, the producing district would have a certain circuit round it which would be a sort of protected ground, and have to be supplied from one particular market, and others would be shut out.

11,409. (*Lord Stanley.*) Your argument is that instead of creating inequalities of advantage by that variety of rates, you rather tend to lower the natural inequalities existing between one place and another?—Quite so; that is the case.

11,410. (*Earl of Belmore.*) In point of fact, would a company under any circumstances carry traffic at an actual loss?—No; I do not think they would unless they were getting a greater gain some other way. For instance, the rate between Fleetwood and Preston is a very low rate indeed, and it is a question whether they get any profit out of it, but then they get a profit out of the other portion of the cargo which goes to other places.

11,411. (*Capt. Galton.*) Do they get a profit out of the dock dues at Fleetwood?—Yes, they get the charges upon the shipping there.

11,412. The shipping charges go to the London and North-western Company, do they?—To the London and North-western and the Lancashire and Yorkshire Companies. The London and North-western Company are owners of one-third of the Preston and Wyre Railway and Port.

11,413. And therefore the object of charging a low rate on the timber is to obtain shipping dues and interest upon the money which they have spent on the docks?—It is to increase the traffic of the port. Their main object is to obtain the carriage of traffic upon their railway.

11,414. (*Mr. Horsfall.*) Has the railway company erected any warehouses at Fleetwood?—No; there is a shed upon the wharf, and there is a small wooden warehouse which was erected there for salt.

11,415. Is there any charge made for the use of that shed or warehouse?—No, nothing; in fact the warehouse is not used now. It was a failure with the salt traffic, and I believe it is not used at all now. The other is a mere open shed over the rails on the wharf.

11,416. (*Mr. Glyn.*) Are the Committee to understand you to say, in point of fact, that the general application of this principle would always tend to the advantage of the consumer?—Yes; I say it is a great public advantage, and that if the railway companies were to adopt the other principle of charging a mileage rate they would shut out all competition, and that would create a very large increase, not only in the price of carriage, but also in the price of the articles themselves, because it would shut out competition in trade as well as in railway carriage.

11,417. (*Mr. Horsfall.*) Then are we to gather from what you say that you are anxious to promote competition?—I do not know that we are anxious to promote competition any further than is necessary for the benefit of the traffic.

11,418. And for the benefit of the public?—The public are benefited by it.

11,419. (*Mr. Leveson Gower.*) I suppose where there is no competition your rates are limited by a consideration of the possibility of future competition?—Quite so; and no railway company can impose very high rates upon the traffic to any place where there is trade, because if they did it would only lead to a competing railway being made; it would lead to competition if they were to attempt such a thing, and it is almost impossible to do it, because there is competition now to almost all the principal places in the kingdom.

11,420. (*Capt. Galton.*) You do charge your maximum rates in some places, do you not?—Yes; we charge our maximum rates in some places and on some articles.

11,421. (*Mr. Glyn.*) Generally speaking, since the railways have been opened there has been a tendency, has there not, to reduction periodically down to the present time?—Yes; no doubt the tendency is to reduce the rates, and not to advance them.

11,422. (*Mr. Horsfall.*) Has there been any material reduction of rates between Liverpool and Manchester?—There has not been any material reduction excepting in grain.

11,423. And that recently?—Last January.

11,424. (*Chairman.*) Will you now proceed to the next point, with respect to sugar, and give what explanation you think necessary to the Commission?—Mr. Clark states that sugar from Liverpool to Sheffield is charged 20*s.* per ton, and from Hull to Sheffield 13*s.* 6*d.* The same reason again applies there—the water competition has caused the lower rate. I believe that the rate of 20*s.* from Liverpool to Sheffield has been reduced; at the time that that evidence was given it was 20*s.*, but it is 15*s.* now.

11,425. (*Mr. Horsfall.*) What is the water competition to which you refer between Hull and Sheffield?—It is the river Humber and the river Trent; it is a free navigation more than half way. I think they only pay dues for some 34 or 35 miles on the canal, and those are low.

11,426. (*Capt. Galton.*) From Bristol to Burton there is a free navigation, is there not?—Yes; from Bristol in the direction of Burton, and the South Staffordshire district generally.

11,427. What water competition is there?—There is the Severn, which is a free navigation as far as Stourport, and from Stourport there are very low canal dues.

11,428. You mean on the Staffordshire canals?—Yes; and the navigation is practically free up to Stourport, which is very near to South Staffordshire.

11,429. (*Chairman.*) A complaint was also made as to salt not being carried by the London and North-western Company at all, the whole of it being taken to Liverpool by the Weaver navigation, what explanation have you to offer on that point?—With regard to salt, we quote a rate for salt from Winsford to Liverpool of 3*s.* 3*d.* per ton. I think that the distance is about

36 or 38 miles. The rate by water is 3*s*. There are about 600,000 tons of salt a year conveyed between Winsford and Northwich and Liverpool, and the shipping portion of it all goes by water, because it is taken by the boat alongside the vessel, and they discharge from the canal flat into the ship. If we take it by rail, it has either to be carted from our station through the town of Liverpool, or we can take it down to some of the docks over the dock railways. But for taking it there we have to pay 6*d*. per ton upon the salt, however short a distance it goes upon that dock railway; and then there is no convenience made at Liverpool for putting it into the vessel, and the consequence is that it goes entirely by water.

11,430. (*Mr. Glyn.*) To whom do you pay the 6*d*. per ton?—To the Liverpool Dock Board, who charge us that 6*d*. per ton for merely crossing their rails. We have just made a new station at the northern end of Liverpool at a very large cost; and in order to get to the timber yards and places upon the docks we have to cross their line of railway, and they charge us 6*d*. per ton for doing that.

11,431. (*Chairman.*) Why are not the same considerations applied to other traffic as well as to salt; why is it confined to the salt trade alone, that it is more convenient to take it by canal than by rail?—The same thing applies to coals or anything in large quantities where the carriage and labour form a material part of the cost; 6*d*. per ton added to our 3*s*. 3*d*. for salt would it make it 9*d*. more than the canal dues, and then there is the great additional cost of labour by conveying it from the dock rails to the vessel, whereas they can put the lighter alongside, and lift it into the ship at once.

11,432. Do you carry no heavy description of goods into Liverpool for export?—We do not carry any coals or salt. The dock committee did make some accommodation for the shipment of coals in connexion with the Lancashire and Yorkshire Railway; but that has been used to a very small extent.

11,433. (*Mr. Horsfall.*) Has any representation been made to the dock company relative to the charge of 6*d*.?—Yes.

11,434. With what success?—The answer was that they charged to everybody 6*d*. per ton, and that they had the dock rails to maintain.

11,435. Sixpence per ton for simply crossing the line?—Yes; whatever distance the traffic goes they charge the same. If it goes from end to end they charge the same; but our traffic never travels far upon their railway. It never travels more than, perhaps, a quarter of a mile or half a mile, except the timber which comes from the north end to our Waterloo station, and will now come principally to the North Dock station.

11,436. But the charge is a uniform one, whether you simply cross the line or whether you go along the docks for two miles?—Yes, that charge of 6*d*. will extend from something like a mile or a mile and a half to the mere crossing.

11,437. (*Mr. Glyn.*) Has there been any application to Parliament on the part of the railway companies to lay down their own rails to the wharf side?—I think not to my knowledge. There is no charge made at Birkenhead, and there is no charge made at Hull. The railway companies there can put their waggons on the dock rails, and they do do so, and discharge their goods into sheds which are made over the dock rails, and the goods remain there till they are taken into the vessel.

11,438. (*Capt. Galton.*) There is one question in connexion with salt which I wish to ask you. I am not sure whether you have seen the evidence of Mr. Corbett. He told the Commissioners that you or the Midland Company charged him 9*s*. per ton to go to London, and from Winsford, which was 105 miles, being 36 miles further, you charged 9*s*. 6*d*. per ton?—I think that Mr. Corbett's works are upon the Great Western Railway, or the Midland Railway, near Worcester.

11,439. They are at Stoke, on the Midland Railway, near Bromsgrove. Have you seen his evidence?—I have not seen that evidence of his at all. But no doubt it is caused by some such circumstance as I stated before, that if the Winsford people are to ship salt at all, they cannot pay above a certain rate for its carriage to London; and so long as a Winsford man is not charged a less gross rate than Mr. Corbett is charged, I do not see what Mr. Corbett has to complain of, because he has only to meet the Winsford man on the same terms. I do not know what the rates are.

11,440. 9*s*. and 9*s*. 6*d*., the one being 6*d*. more than the other?—I was not aware of that; but I am merely speaking as to the principle.

11,441. Your principle is, that upon particular classes of traffic you only charge such a rate as will enable the goods to compete in a particular market?—Precisely. If you charge more, you stop the traffic altogether.

11,442. (*Chairman.*) Will you proceed to the next point?—Then as to the complaint of want of accommodation for coal traffic, the facts are that the local coal owners have yards in Crown-street at the termination of the line of railway. Most of the coal proprietors or coal dealers have yards of their own, and the traffic has no doubt outgrown the accommodation; and the difficulty is, where to provide fresh accommodation. The parties cannot extend their premises, and the company have no additional land that they can appropriate to it. We have just purchased a considerable plot of land near to our Edgehill station, which we are now laying out for additional accommodation. We have also made a new line of railway, a branch from Edgehill down to the north end of Liverpool, and upon that line of railway we have purchased very considerable pieces of land where the main roads cross the railway, and we intend to provide accommodation for coal traffic there. That will very considerably relieve Crown-street, because a good deal of the traffic that at present goes to Crown-street is carted into that neighbourhood. We had a meeting with the coal proprietors, that is to say, our chairman met them some time ago. They wanted the company to buy a particular piece of land at Liverpool, which was a very expensive piece, and I believe the owner of it would not sell it for the purpose; but even if he would, it would have cost a very large sum of money to have made a connexion with it. The company offered to purchase any suitable land that could be purchased about the neighbourhood if the coal proprietors would guarantee to the company such an increase of traffic as would pay them something like a fair return for the outlay, but they declined to do that. We are, however, adding largely to the present accommodation to meet the requirements of the trade, and doing the best we can. As I have stated before, we have purchased at a very large cost a considerable piece of land at Edgehill, the nearest place at which we could get any to Crown-street, and we are making additional accommodation upon the new branch line.

11,443. (*Mr. Horsfall.*) Are the coal owners aware of that additional accommodation which you are providing for them?—It was pointed out to them at the time the chairman met them at Liverpool.

11,444. I think that you have recently raised the terminal charge upon coal, have you not?—No.

11,445. Will you just look at that (*handing a letter to the witness*)?

That letter is as follows:—"Mineral Traffic. Super-
" intendent's Office, Preston Station, November 22nd,
" 1865. Gentlemen,—I beg to inform you that on
" and after the 1st December next, the rate for coal
" and slack from your collieries to Crown-street
" station, Liverpool, will be, coal, 1*s*. 6½*d*., slack,
" 1*s*. 4¼*d*. per ton. In addition to the above rate, a
" charge of 3*d*. per ton will be made upon all coal
" unloaded on this company's wharf, as for use of
" such wharf."—

It is not an advance, and I will explain how it is. We made the same charge before in a different form; we made a charge for wharfage, and a charge which was at one time called tunnel rent, which was for bringing the coals from an old tunnel, which was formerly the Crown-street tunnel, and it was for taking the coals

W. Cawkwell, Esq.

13 Feb. 1866.

from there to the yards of private owners. A question was raised when we were in Parliament last year as to what the tunnel rent was. It was, in fact, an improper term used, and now it is all charged under the head of wharfage: but it is no increase of price at all, the same charge is made, only it is put under a different head.

11,446. Is it not desirable that that should be explained a little more to the coal owners?—The coal owners know it perfectly well.

11,447. I received a note from a coal owner in which he still complains on that subject?—That may be, but we agreed with the coal owners. We had a meeting with them, and they agreed to pay us one penny per ton for drawing coal to their yards.

11,448. (*Chairman.*) It has been stated that Liverpool has lost a portion of the French trade in consequence of the high railway rates charged from Yorkshire to Liverpool, can you explain that?—That is not the reason of the trade falling off. I think the witness does not say that the trade has fallen off, but that it has not increased. But the reason is, that since the time he speaks of there have been communications made between London and France, and also between Grimsby and Hull and France, that did not exist at that time. For instance, there is now a daily communication by the South-eastern; another by the London, Chatham, and Dover; another by the London, Brighton, and South Coast; another by the South-western; and there are, I believe, daily steamers from the Thames to the French ports, and I think three days a week there is a direct steam communication between the Thames and Paris. The Liverpool communication consists of about six steamers per month to Havre, about three per month to Bordeaux, and an occasional steamer to Rouen and Nantes. I believe that is about the extent of the communication from Liverpool. Therefore it cannot be expected that the traffic will increase against the improved communication by other routes, and the arrangements that have been made between the French railways and the companies south of the Thames for the cheaper transit of goods from London to the Continent.

Then, with regard to the 10 per cent. clause in the Liverpool and Manchester Act, which Mr. Clarke speaks of, that provision was repealed by the Amalgamation Act of 1846; but even if it was not repealed it never could be complied with, because the line is now so completely altered, and the additional money that has been spent upon it is so great in amount, that it would not pay 10 per cent. upon the present expenditure.

11,449. (*Mr. Horsfall.*) On the present cost you mean?—Precisely; it would not pay it on the present cost. Since the line came into our hands we have spent, I believe, one million and three-quarters upon stations in Liverpool.

11,450. (*Capt. Galton.*) Has any separate account been kept of that expenditure?—Up to a certain period railway companies did not keep separate accounts of stations and lines. We have for some years kept a separate account, but not for the whole period.

11,451. (*Mr. Horsfall.*) Has not that expenditure been consequent on the amalgamation of the Liverpool and Manchester with the London and North-western and other companies?—It has been consequent on the increased traffic of the port, arising from connexion with other railways no doubt; but if the other railways had remained independent, the expenses must necessarily have been incurred if the traffic had been accommodated by the Liverpool and Manchester Company.

11,452. You speak of its being occasioned by the increase of traffic; there is no doubt that the traffic of Liverpool has increased three-fold since that line was constructed; consequently the dividend, instead of being 10 per cent., would have been something like 20 or 30 per cent., would it not?—I do not think it would ever have paid a company owning a line only from Liverpool to Manchester to have spent the money which the London and North-western Company have spent at Liverpool and on their entrances into Liverpool and Manchester. For instance, in London traffic they have an interest all the way to London; but if the Liverpool and Manchester Company had remained independent, they would only have had their interest in it as far as Newton Junction, a distance of about 14 or 15 miles, in lieu of their interest in about 200 miles. Therefore the London and North-western Company have spent a much larger sum than the Liverpool and Manchester Company, if they had remained independent, would have been warranted in spending, and that, no doubt, would have led to making more lines into Liverpool in lieu of the London and North-western using the present line, and then the traffic upon it would not have increased so much.

11,453. But, as regards the public, the benefit of that 10 per cent. clause has been evaded, has it not?—We say that it never would have arisen, because if they had only the small capital which they had formerly, they could not earn 10 per cent.

11,454. If the line had remained separate, the dividend, instead of being 10 per cent., would in all probability have been 20 per cent. had it not been for the protection given to the public under the Act of Parliament?—I think not.

11,455. (*Mr. Glyn.*) In point of fact you found that as your traffic with Liverpool increased you had to find new station accommodation?—Yes. I say that unless we had spent the money we could not have had the traffic.

11,456. (*Chairman.*) Do you state positively as a fact that that provision was repealed by the Amalgamation Act of 1846?—It was.

11,457. There were some complaints made by Mr. Clarke with regard to the terminal charges in Liverpool, as compared with the cost of cartage. Can you give any explanation upon that point?—First, with regard to the cost of cartage, he says that the cost of cartage in Liverpool averages about 10*d.* per ton. I may say that the Liverpool cartage is regulated by the Liverpool Corporation—I do not know by what portion of it,—but they fix the cartages according to a table of distances, as 600 yards' distance, 1,200 yards' distance, and 1,800 yards' distance, and they regulate the charge to be made for the cartage of traffic in Liverpool by a scale for different articles and manufactured goods, as 1*s.* 2*d.* for a distance of 600 yards, 1*s.* 5*d.* for 1,200 yards, 1*s.* 7½*d.* for 1,800 yards, and so on for different descriptions of traffic. We cannot cart at anything like 10*d.* per ton, nor can we hire at that price.

11,458. (*Mr. Horsfall.*) You are quite correct in saying that there is a table published by the corporation, but that is the maximum rate, upon the same principle as the maximum rate is fixed by the railway company, but I believe there is no instance where the carters charge an amount equal to that rate, and if I recollect Mr. Clark's evidence without referring to it, he stated that he was prepared, and that other parties were prepared, to cart the goods at that rate, and cart them with a profit?—The London and North-western Company do very little cartage themselves. We keep a few carts for the delivery of what we call town traffic, that is, traffic for the shops and private establishments, some little of that kind of traffic is carted by us, but the rest is either carted by the consignees, or, if we are requested to do it, we hire the cartage. I have endeavoured to ascertain really what is paid in Liverpool by other parties than railway companies, because that is, perhaps, the best criterion, and we applied to a few parties in Liverpool upon the subject. For instance, John Trippett and Brother, shipping and commission agents; we asked them what they paid, and they said, "Being large employers of carts, we pay "1*s.* 6*d.* per ton for the cartage of our goods, far and "near, and believe it is as low as it can possibly be "done at." We applied to Mr. Joseph Rees, and he stated, "I beg to state that 1*s.* 6*d.* per ton is the lowest "paying rate for cartage, far and near, in Liverpool. "Being the owner of 57 cart-horses, and attending to "the business personally, I am satisfied nothing less

"will pay." Then we applied to the British and Foreign Steam Navigation Company, and they say, "I find that this company have been paying for the "cartage of their goods from the Huskisson dock, west "side and south side of branch to the railway stations "or any other part of Liverpool, 2*s.* per ton weight, "and on all goods for export lifted and delivered at "any place in Liverpool at the rate of about 1*s.* 3*d.* "per ton weight. For machinery we pay 2*s.* per ton "weight." We applied to the Liverpool, New York, and Philadelphia Steamship Company on the subject, and received the following reply:—"In answer to your "inquiry, I estimate that our cartage from your "Waterloo station to our berths, Huskisson docks, "costs us at the rate of about 1*s.* 9*d.* per ton of 20 "cwt." Then Messrs. Platt and Company, of Castle Street, state, "Our average cost for the cartage of "our goods is about 1*s.* 10*d.* to 1*s.* 11*d.* per ton "weight." They all say the same thing. Those are people who are employing a very large number of carts and doing a great deal of cartage, and that is what they say they are paying. I can only say that it quite accords with what we pay, and I cannot understand how Mr. Clark can do it at 10*d.* a ton.

11,459. Those gentlemen do not tell you what discount they get out of those charges, do they?—They were asked what they actually paid, and it is what we actually pay, we get no discount.

11,460. Do they tell you whether they get any and what discount off their bills?—No, their answer is what I have read, and I presume that is the cost of cartage.

11,461. You have not compared it with the book of rates of which you spoke just now?—It is lower than the book of rates certainly.

11,462. Perhaps you are not aware of a custom which exists in Liverpool of putting down certain charges, but of taking off a considerable discount where there is a large bill?—That does not alter the rate, it only gives a profit to the broker in Liverpool, who gets it out of the cartage, the public pay the rates I have stated, and that is what we pay for any cartage done in Liverpool. We do not get any discount.

11,463. I do not look upon that as an answer to Mr. Clark's statement that you could do it at 10*d.* a ton with a profit, although others pay more I have no doubt?—We cannot hire cartage at anything like that price in Liverpool. We have a very large amount of cartage ourselves, we deliver Staffordshire iron, which is a heavy article and perhaps the cheapest carted article that you could have, and we allow 1*s.* a ton if the parties cart it away from the station, but we can get nobody to take it away. If it is going a very short distance, just across the road into the dock, they will take it at 1*s.*, but we have to hire nearly the whole of it, and pay 1*s.* 4*d.* a ton for it. That is in the case of iron going in very heavy quantities direct from the station and all delivered at one spot, it is not taken to two or three different places, and we cannot haul it for less than 1*s.* 4*d.*

11,464. (*Mr. Glyn.*) Individuals may do their own cartage, may they not?—They may.

11,465. And if they could do it cheaper they would?—Yes; in Liverpool it is not the custom for the companies to cart.

11,466. (*Chairman.*) Have not you some remarks to make with regard to the complaint about the rates for corn?—With regard to the complaint about the rates for corn, I may state that a deputation from the corn trade sought an interview with the London and North-western Company about those rates, and the other companies as well were represented—the Lancashire and Yorkshire, the Manchester, Sheffield, and Lincolnshire, and the Bridgwater trustees. We had several interviews with the deputation, and they stated what alterations they wanted made in the rates. Amongst other things they wished to have a separate rate where the grain was not warehoused. It had always been the custom before to warehouse the grain for an indefinite period in Manchester. The companies were not disinclined to meet the views of the corn trade; but it was found that the Manchester people who received the grain differed materially from the Liverpool corn merchants in their views, and we suggested that the Liverpool and Manchester corn merchants should meet together and see if they could agree among themselves what was best for the trade; because, after all, it was a mere question of which was most convenient for the traffic. In the event it was reduced, but it was quite against the opinion of the Manchester people; and I now hold in my hand a letter from the Manchester corn merchants, addressed to the London and North-western Company, dated the 28th April, 1862, when the discussion was going on, in which they say:—"We understand that a "body of gentlemen connected with the corn trade in "Liverpool, known as the Liverpool Corn Association, "are applying to you to reduce the rates of carriage on "grain, flour, and meal from Liverpool to Manchester, "and other places in the interior, and suggesting that "warehouse rents be charged at such places as an equi- "valent. We have to represent to you that such a "proceeding, if assented to by you, would be greatly "prejudicial to our interests, as we know from long "experience that the charge for warehouse rent is a "very objectionable one, and a serious obstruction to "business. We are the parties who pay the carriage, "and we are satisfied with the present charges and "system as a whole, and would deprecate any change "which should subject us to a rent charge. We there- "fore respectfully beg that no alteration may be made "in the present mode, by which the rate of carriage "covers a moderate accommodation for rent and other "charges, and thus serves the general convenience of "the trade, besides the advantage of having settled "rates, instead of various and fluctuating charges, and "the avoidance of an obnoxious impost in the shape "of rent." They objected to the warehouse charge because it fluctuated according to the time the grain remained in the warehouse.

11,467. (*Capt. Galton.*) Does not the warehouse charge favour some individuals at the expense of others?—This is signed by all the principal corn merchants in Manchester, who were the parties who really paid the rate; but that shows the difference of opinion among the traders themselves with regard to the rates. The Liverpool people are complaining of the rates being high, whereas the Manchester people are perfectly satisfied and do not want any alteration made, and they protest against an alteration.

11,468. (*Mr. Horsfall.*) Those Manchester people are the parties who pay the rates?—Yes; they are.

11,469. Can you conceive any reason for a man desiring to pay 8*s.* 4*d.* in preference to 5*s.* for the transmission of his corn?—Upon the whole, I dare say, they had an advantage under the other system, because so large a portion of the corn is warehoused; that by paying upon the average they consider they are better off than by paying a warehouse rent, fluctuating according to the time the grain may remain in the building.

11,470. (*Capt. Galton.*) Does all the grain, which those people are speaking of that goes to Manchester, come from Liverpool?—It is solely from Liverpool; the traffic in question was grain from Liverpool to Manchester and the surrounding towns.

11,471. (*Mr. Horsfall.*) But in fact it is not a lower rate for carriage from Liverpool to which they objected, but to the system of charge for warehousing?—The Manchester people stated they were satisfied with the system and also the charges, and the Liverpool people were dissatisfied with them.

11,472. If you put it to the Manchester people, irrespective of warehouses, whether they would prefer paying 8*s.* 4*d.* or 5*s.*, what do you think would be their answer?—Of course there could be no question about that. But this merely refers to the two systems, the one advocated in Liverpool and the other in Manchester, and the men who paid the charge were satisfied with what we were charging, whereas the men at Liverpool, who did not pay the charge, were the objectors.

11,473. (*Chairman.*) But you have made, have you

W. Cawkwell, Esq.

13 Feb. 1866.

not, to a certain extent a concession to the views of the Liverpool merchants?—Yes, we have.

11,474. Have there been any remonstrances from the Manchester dealers in consequence?—No; but I dare say they would rather go back to the old principle.

11,475. (*Earl of Belmore.*) Would all the corn go through the hands of the Manchester dealers, whether it was warehoused or not?—I should think nine-tenths would go through the hands of those gentlemen.

11,476. Then it was not the warehousing that they complained of, but in point of fact the complaint made would be that, instead of the corn going through their hands, it would go directly into the hands of the consumer?—I do not think it would make any difference in that respect. I believe it suited the practice of their trade better, that is to say, they had it in one charge, and they knew what the grain cost them including the warehouse charge, at present it is a fluctuating charge and they do not know what it is to be. I may state that before this Commission sat, or before we knew of it, we had considered the question of the general Liverpool and Manchester rates, and we had represented to some other companies the desirability of making some changes. That has been deferred principally owing to the sitting of this Commission, because none of the companies liked to make changes which they might be charged with making because this Commission was sitting. But the London and North-western Company have pressed the matter upon the other companies carrying between Liverpool and Manchester, in fact we have given them notice that we should go to arbitration if they do not agree to make an arrangement with us with regard to lowering those rates.

11,477. (*Chairman.*) Do you desire to see the rates reduced between Liverpool and Manchester generally?—We wish them to be revised. Then I think Mr. Clark made some statement as to the low rates made from other ports as against Liverpool, and in estimating those rates he has deducted a terminal of 2*s.* per ton, in order to reduce it to a mileage, so as to show the mileage from Liverpool against the mileage from other places. I think in the Appendix he gives a table of that kind. There were a number of tables handed in by him. There is one with regard to timber and deals, and in which the mileage is given. Perhaps I may be allowed to hand in one of these tables, which I have had prepared so that the Commission may see how the matter really stands in that respect (*delivering in the same, see Tables* 1, 2, *and* 3).

Station to station terminals are calculated at 1*s.* 6*d.* at each end.

NOTE.—Where no figures are inserted in the London and North-western column the rates agree with those of the Liverpool Chamber of Commerce.

This table shows first the distances. There are some errors in the distances in Mr. Clark's table, and those are corrected in the second column. Then there are the rates as reported to the Royal Commission, with the rate per ton that Mr. Clark makes it, that is deducting a terminal of 1*s.* per ton, but that 1*s.* per ton is not anything like what it costs us in Liverpool.

11,478. The total rate, the lump rate, is generally, I suppose, about correct?—Yes, only Mr. Clark makes his tables out to show a great inequality of mileage between different places, and of course the less he takes off for terminal the greater the discrepancy of the mileage rates. He has taken off 2*s.* per ton, 1*s.* at each end, whereas it costs us a very great deal more than that for the terminal services at Liverpool.

11,479. Is 1*s.* not sufficient at either Liverpool or Manchester?—No; our calculations are based upon 1*s.* 6*d.* at each end, but that does not at all represent what it costs us.

11,480. (*Mr. Horsfall.*) I see in this table there are several blanks, what does that mean?—Those are cases where there is no difference between Mr. Clark and us. In some places they are wrong in their rates per ton, and in the last column but one we correct their rates. Where there are blanks Mr. Clark is right in his rates, we merely put in the figures where the rates are wrong. At Liverpool we have to pay 6*d.* per ton toll for the passage of this timber to begin with along the dock railway; it costs us 15*d.* per ton for bringing it to our station, and then there are all the station expenses upon it when it gets there, and the cost is so great that the other railway companies allow us an extra terminal at Liverpool on this traffic. Instead of the usual allowance of 1*s.* 6*d.* per ton between company and company, we are allowed 3*s.* per ton upon this traffic at Liverpool.

11,481. (*Mr. Glyn.*) That is paid by the other companies?—Yes, that is a rate paid by them in consideration of the great expense that we go to. Therefore 1*s.* per ton at each end does not at all represent the cost, and even this table does not represent the cost to us, because we merely deduct the 1*s.* 6*d.* at each end.

11,482. (*Chairman.*) This table only refers to timber?—Only to timber.

11,483. (*Mr. Horsfall.*) Are those rates the same as when Mr. Clark gave his evidence in every instance?—I believe they are. I am not aware of any alterations having been made in the timber rates. Where they have been altered since, I believe we have always made a remark either in the body of the table along with the figures or as a foot note. There is one alteration here, I see, in the Birmingham rate. You will find that this rate was revised in August 1865. I do not know whether that was before Mr. Clark gave his evidence or not. Where there has been any alteration since we have stated it in the paper. For instance, the distance to Salop they had reckoned by the Birkenhead route. If they do that they must take the crossing of the Mersey into consideration. I consider that taking it across the Mersey is an additional charge, which may be estimated as a very considerable addition to the mileage. We have taken it of course by the London and North-western route, by the railway by which we carry it.

11,484. You estimate the crossing of the Mersey as equal to a pontage of 20 miles?—If it is done so it would be equal to that, but we have taken it as the actual distance by our own route. The rate to Derby was reduced from 13*s.* 4*d.* to 12*s.* 6*d.* in November 1865, but when any change has been made since this evidence was given we have noted it here. The other tables which I have here refer to the same thing; they are all with regard to timber and deal rates, and the same remarks apply to all those timber and deal rates.

11,485. (*Chairman.*) What you mean to state is, that the tables put in by Mr. Clark gave a very partial view of the matter, and that other tables might have been drawn up which would have shown how Liverpool was as much benefited as Mr. Clark made out that it was injured?—Considering the great cost to the companies in Liverpool, I believe that Liverpool is in a very favourable position with regard to those timber rates. If you take Hull, which is compared with Liverpool, the railways there go into the timber yards, and they can get the timber on to the railway at a very small cost indeed; they have no dock charges to pay, and they are in a very much more favourable position than we are in at Liverpool, which is a very expensive town indeed to work.

11,486. Do you propose to put those tables in?—Yes (*see previous tables*).

11,487. Have you any tables relating to the corn trade?—Yes; I will hand one in afterwards with regard to the corn trade, which is, I think, referred to in Mr. Paterson's evidence. I will now go on to the next paragraph, which will raise the question of grain. I had better state at present that the lowest terminal

W. Cawkwell, Esq.

13 Feb. 1866.

that can be considered as the cost at Liverpool for heavy traffic of that kind would be 2*s.* a ton instead of 1*s.*; but on the average it costs us a very great deal more. Then on the same ground I will hand in a table which will show that the company carry corn from Liverpool to the places specially named by the corn trade at rates varying from 0·79*d.* to 2·05*d.* per ton per mile; the rate to Manchester, the principal place in the district, being 1·37*d.* per ton per mile, and these rates will compare favourably with the rates of other carriers in the country. Here is a table of corn rates which gives the mileage rate at which we carry after deducting the 3*s.*, which is not the full terminal after all (*delivering in the same*).

The station to station terminals are taken as 1*s.* 6*d.* at each end.

* This rate was revised on November 10th, 1865.

† Rates issued 1st January 1865 and August 1865.

	O. Sacks. *s.* *d.*	C. Sacks. *s.* *d.*
If removed from the carrier's warehouse within 24 hours	6 8	7 4
If not removed within 24 hours, but within 2 calendar months	7 6	8 2
If not removed within 2 calendar months	8 4	9 0

† GRAIN—LONDON AND BIRMINGHAM.

Collected by barge in London, and delivered in Birmingham. If collected by cart in London, 1*s.* 8*d.* per ton extra. The station to station terminals are 1*s.* 6*d.* at each end, and collected and delivered 1*s.* extra at each end.

‡ The London and North-western Company do not carry between these Stations.

NOTE.—Where no figures are inserted in the London and North-western column the rates agree with those of the Association.

11,488. You deduct here 3*s.* as a terminal?—Yes; 1*s.* 6*d.* at each end. We have taken 1*s.* 6*d.* because that is a general arrangement amongst the companies; we allow each other 1*s.* 6*d.* per ton in settlement, but that is more a matter for convenience of account, because if one company pays more in one instance it receives it in another, it does not at all represent what it costs, but merely a sum fixed for the settlement of accounts between one company and another.

11,489. Have you prepared a table showing numerous cases in which the rates generally are in favour of Liverpool as compared with other places?—Yes.

11,490. Will you put that table in?—Yes (*delivering in the same*).

TABLE 5.

The following Table shows that low Rates have been made in favour of Liverpool for a large portion of the Traffic, without which many Articles of importance to Merchants and Shipowners would have left Liverpool altogether.

* This rate was reduced to 7*s.* 6*d.* in August 1865.

Except where otherwise stated, the rates include collection and delivery.

At Liverpool the public perform their own cartage, except on London traffic, which is collected and delivered at both ends by the Company.

N.B.—From rates, including delivery alongside, 4*s.* per ton has been deducted for terminals.

W. Cawkwell. Esq.

N.B.—Terminal deductions as follows:—

Carted traffic { Liverpool and London - - - - 4*s.* 0*d.* and 8*s.* 6*d.* = 12*s.* 6*d.*
Liverpool and other places - - - 1*s.* 6*d.* and 4*s.* 0*d.* = 5*s.* 6*d.*

Station to station traffic, 1*s.* 6*d.* Liverpool, and 1*s.* 6*d.* country.
When barged, 1*s.* per ton extra.

11,491. Can you explain some of the facts that that table would prove?—The table will show it best. In the first place we make low rates from Liverpool for a variety of goods which arrive there by ship; for instance, palm oil, cocoa-nut oil, and shipping goods to and from London to all parts of North America, Spain, the Mediterranean, the West Indies, the Pacific Ocean, and Australia. The rate for preserved provisions and Australian wool has also recently been extended to American goods from London to Liverpool. That was done in order to encourage the shipment of American traffic at Liverpool instead of Southampton and other places in the south. A low rate for Australian wool was made in the same way, in order that the wool might come to Liverpool in Liverpool ships, and be carried to London at a cheap rate, because it has to come to London for the wool sales, the wool sales being held in London. If that low rate had not been made the traffic would have all come direct to London, and it is on the representation of the Liverpool ship owners that those rates have been reduced, to encourage that traffic to come to Liverpool, in the same way that they complain of our doing to other ports. In the same way there is a rate for jute to Dundee, for bales and cases from Dundee to Liverpool, for shipment to America. Then you will see a number of low rates for grain to different places in the midland counties, cotton to Southampton, and salt provisions to Plymouth; and, on the other side, there are special rates for oil-cake, which is an article manufactured in Liverpool. The manufacturers wanted low rates from Liverpool to the agricultural districts, in order that they might send their oil-cake there, and we made low rates for them. There is a very large shipment of iron from South Wales, which was being shipped from the South Wales ports, and since the railway was opened they have asked us to make low rates for this iron to come to Liverpool, in order that it might be shipped at Liverpool, and we have made very low rates for them. The same remarks apply to a great variety of articles which we are carrying to Liverpool, in order that the traffic might be carried by vessels trading to and from Liverpool. We are carrying them to Liverpool at lower rates considerably than the rates which they have accused us of charging to and from other ports as against Liverpool; and it has this effect, that the parties in South Wales can either take advantage of vessels going from the ports in their own districts, or if they can ship it cheaper by way of Liverpool (and, no doubt, they can send it much more frequently, and perhaps by a better class of vessels), they have the advantage of sending it to Liverpool instead of being confined to their own ports, as they were previously.

11,492. (*Mr. Glyn.*) The iron trade has the advantage in freight owing to the competition between the vessels?—Yes.

11,493. (*Mr. Horsfall.*) I collect from what you state that your opinion is that the advantages which

you give to Liverpool are greater than the disadvantages under which she labours under your present system?—I say distinctly that the advantages which we have given to Liverpool in these respects are very great indeed; and I do not see that Liverpool is at a disadvantage by the cases which they have brought against us, for on looking over the rates that they have produced, the majority of them are not higher in the gross than the rates charged from other ports. They have reduced them to a mileage, and they complain that our mileage charge is lower, but if the gross charge is not lower (and in most cases it is higher), the Liverpool people surely are not damaged by the fact that they have to meet their competitors in the market on equal terms, but in the majority of cases, as I have said, the Liverpool gross rates are lower.

11,494. Going upon the mileage rate, they are considerably higher, are they not?—Our mileage rates in the cases that they have selected are higher, but if they had given you all the rates from Liverpool, for instance, if they had put this list in, they would not appear higher, but lower upon the mileage rates; but they have selected examples to suit their case. I do not blame them for that, they have selected those cases that they considered best for their argument.

11,495. (*Mr. Hamilton.*) Is that document to which you are now referring one that can be accessible to the public generally?—The cases in this table are extracted from our rate books.

11,496. It is not accessible to the public on ordinary occasions?—No.

11,497. Any person wishing to know the different rates of the London and North-western Company could not get it in that tabular form?—No.

11,498. (*Mr. Glyn.*) They could get it upon inquiry, could they not?—Yes; I have taken these out of our Liverpool rate book to show some instances of our charging low rates from Liverpool.

11,499. But it is all included in the rate book?—It is all included in the rate book, but not in this form; it is reduced here to mileages, but is not so in our rate book.

11,500. (*Chairman.*) Do you wish to make any other remarks with reference to the charges made against the London and North-western Company connected with their Liverpool rates. Are the answers that you give to the other charges of the same character, or is there anything special in any other of the complaints which have been made that appears to you to require a special answer?—There was a good deal said about timber. I should just like to show that in our rates for timber we carry a very great deal more than 20 cwt. of timber per ton; we carry timber at the weight at which it is sold, and not at the actual weight. Mr. Chaloner, one of the largest timber brokers in Liverpool, makes a great point in his advertisements that Liverpool is particularly favoured in the measurement of its timber as against other places, and that the buyers have a decided advantage in coming there in consequence of that circumstance. Here is one of his advertisements, in which he says:—"This cargo, on "account of its excellent quality and large size, has "been divided into 316 lots, containing 807 logs, "measuring 287,169 feet sale against 431,524 feet ac-"tual." We carry the 431,524 feet and are only paid for 287,169 feet.

11,501. Is that Mr. Chaloner's circular?—Yes, it is one of his circulars. He gives the weights. For instance, here he gives the extreme contents and the sale contents. There are 461 extreme contents and 328 sale contents, 806 extreme contents and 563 sale contents, 744 extreme contents and 526 sale contents, and Mr. Chaloner, in some of his circulars, calls particular attention to the advantage which Liverpool has over other ports in the circumstance that the measurements are different, and therefore the buyer gets more for his money, and gets more carried than is carried from other ports for the same weight charged.

11,502. (*Mr. Horsfall.*) I presume you do not see all Mr. Chaloner's circulars?—No.

11,503. Did you see one a short time ago, in which he congratulated the public on the completion of the Manchester, Sheffield, and Lincolnshire Railway, owing to the high charges of the London and North-western Company?—Yes; I know that Mr. Chaloner very often makes remarks about railway companies in his circulars. I am only explaining the facts which his own circular states, and I say that in some of them he calls particular attention to the fact of the measurement at Liverpool being more favourable than at other ports, and that buyers coming there get an advantage.

11,504. But you did not see the one in which he calls attention to the high rates of the London and North-western Company?—I have seen Mr. Chaloner's circular calling attention to the high rates charged at Liverpool; but I say that he is mistaken in his comparison, because if he compares the gross rates in one place against another they are not unfavourable to Liverpool.

11,505. (*Chairman.*) Do you not weigh timber yourselves?—No; the sender sends a consignment note stating the measurement weight. It is measured, I believe, by the public officer in Liverpool, and the consignment is sent to us stating the measurement weight, and we charge by that measurement weight.

11,506. (*Mr. Glyn.*) Do you know how that custom has arisen in Liverpool which makes it so different from other ports?—It is the peculiar mode of measuring I believe. In some ports they measure round the balk, and in others they do it by the calipers, so that if the sides are flat the measurement is greater by the girth; and then in the measurement of deals at Liverpool, I believe if the deal is $3\frac{1}{2}$ inches it is charged $3\frac{1}{2}$ inches, but if it is anything below $3\frac{1}{2}$ inches it is charged 3 inches, so that all that is thrown in; and it is the same in the carriage, we only get paid for the weight which is measured for sale.

11,507. (*Chairman.*) I see in this table which you have put in there is a much larger difference between the gross weight and the net weight in the case of goods to and from London than any other places, and that the London terminal is much higher than in any other town?—Yes; the London terminals are very much higher than they are in the country, the cartage is higher and labourage is higher, and in the arrangements between companies in the settlement of accounts, as I explained before, we have an allowance in London of 8*s.* 6*d.* against 4*s.* in the country, and in calculating these tables we have taken those terminals for the sake of calculation.

Then with regard to Australian wool, we carry that, as I have explained, at 25*s.* per ton, which is a very low rate indeed, and we collect the sea freight on the wool in London and pay it to the parties in Liverpool, we have to incur banker's commission, and whatever risks there may be attending the collection. That is a duty beyond what railway companies ordinarily incur, but it is part of our carrying duties. In the same way, in discharging a ship we send men down to the ship's side to take account of the articles there as they are unloaded, and we send the goods up to our warehouse in Liverpool, where they frequently are deposited before they are sent away, and kept there for a considerable time, and when they are ordered to go away we have to select them and to despatch them. All that is additional expense to us beyond the ordinary costs. Altogether Liverpool is a most expensive place to work in the carrying trade. I think I have already explained that we make the same low rates for a variety of articles; silk, oil, wool, and other articles from the Mediterranean, Australia, &c., are carried at very low rates. They are expensive things, and very liable to damage, but the rate is made low in order to induce the traffic to come to Liverpool, because it has to come to London eventually, and if a higher charge were made by the railway company it could not come by the Liverpool ships, it would come direct to London, and the Liverpool people would not see it at all.

11,508. (*Mr. Horsfall.*) The railway carriage is a very small per-centage of the value of the Australian wool, is it not?—No doubt. It is not a large amount

W. Cawkwell, Esq.

13 Feb. 1866.

upon the per-centage of the wool, but that is not the point; it is the cost between Australia and London direct as against Australia and London by way of Liverpool. If a high rate were charged between Liverpool and London the wool would not come to Liverpool at all, but would come in a direct ship from Australia to London; and it is on that representation by the Liverpool shipowners that we reduced the rate, in order that they might carry it by way of Liverpool. A great many of those rates have been lowered in the same way, in consequence of representations from the Liverpool shippers, that certain traffic could be obtained if lower rates were made, and pressing us to do it; and we have endeavoured to meet them as far as we could, as we do in all cases. Then we have made, as I explained before, low rates for oil-cake, which is an article manufactured there. We have made low rates for the South Midland district and between Liverpool and South Wales, in order to increase the traffic, in iron and different articles.

Something was said by some of the witnesses about our carrying between Ireland and England by way of Holyhead. We do carry by way of Holyhead; we have our own steamers between Holyhead and Dublin sanctioned by Parliament, and that line has been opened as the most direct route between England and Ireland. We do not prevent traffic coming by way of Liverpool, but we make the same rates by way of Liverpool as we do by way of Holyhead. Therefore the steamers plying between Dublin and Liverpool have the same opportunity of carrying traffic. We accept their goods at Liverpool, and we divide the through rate between them and us. But the Holyhead route is the most expeditious and the best route, and therefore we do not see that there should be a charge made against us for opening that route.

11,509. (*Chairman.*) Do you bring goods into Liverpool by Holyhead?—No. If they are tendered to us of course we carry them, but we do not seek for the traffic between Dublin and Liverpool.

11,510. Is not this your general principle, that from Ireland to any part of England you charge the same, whether it comes by Holyhead or by Liverpool?—Yes. Whatever rate we fix by way of Holyhead, which is our route, we adopt the same viâ Liverpool, and we carry in connexion with the City of Dublin Company and with the screw steamers between Liverpool and Dublin.

11,511. (*Mr. Horsfall.*) Do you not carry goods free from Holyhead to Holywell?—No, certainly not; I am not aware that we carry goods free anywhere.

11,512. I mean under the Irish arrangement?—That is an arrangement with the City of Dublin Company for a division of the traffic; they have their share of the traffic; in fact, we divide it with them; and in order to estimate the sea distance it is taken on our line as far as Holywell, as against the throughout sea route between Dublin and Liverpool. That is to make the two lengths the same.

11,513. Without any charge on the part of your company between Holyhead and Holywell?—It is merely a division of the through rate.

11,514. But that is the fact, is it not?—No, I do not see that it is; it is merely for the sake of calculation; we charge a rate throughout from Dublin wherever the traffic is going to.

11,515. (*Mr. Glyn.*) It is really the fact as representing a greater number of miles, but you would not book to Holywell for nothing?—No.

11,516. (*Mr. Horsfall.*) Then on the through traffic you get nothing by carrying from Holyhead to Holywell?—We charge just the same as upon any other portion of our railway, but, as I have explained before, we have an arrangement with the City of Dublin Company for dividing the receipts, and if we carry more than our proportion there is no doubt that they get their mileage to Holywell upon the excess carried by us.

11,517. (*Chairman.*) You mean that they deduct it from your general mileage rate?—Exactly. It is merely giving them our mileage up to Holywell upon the excess that we carry above the proper amount, but we get back our working expenses upon such excess.

11,518. (*Earl of Belmore.*) It is merely carrying from Chester to Holyhead at the same gross rate as to Holywell?—It is not even that. It was an agreement made in favour of the City of Dublin Company that if we compete with them, and if we take more than our proportion, we pay them as if they had carried the full quantity.

11,519. (*Chairman.*) Is it a fact that you do carry more than your proportion?—I think there is not much in that. The arrangement was made to act fairly as far as possible, and I believe that there is not much balance paid on either side. Then we have spent a very large amount of money at Liverpool on the stations, as I stated before. We have now three stations; we have the Waterloo station, and the Wapping station, and we have the North Dock station nearly finished. So that we shall have three expensive stations upon the line of the docks. That has cost the London and North-western Railway Company a very large amount of money, and all that tends to lessen the cost of cartage in Liverpool, because the traffic can be delivered at either one station or the other. Of course merchants will not take traffic past one station to another to pay a long length of cartage.

11,520. (*Mr. Glyn.*) But in some cases you will have to pay 6*d.* to the dock trustees?—If we send traffic over their rails then we have to pay 6*d.* if it goes ever so short a distance. For instance, our Wapping station is opposite to some of the principal docks in Liverpool. If we send any traffic down to Wapping to be shipped at Liverpool, and if we send it 100 yards on the dock rails to get it into the dockyard we pay the 6*d.*

11,521. All railway traffic is subject to that charge, is it not?—Yes; the same at Waterloo, which is opposite the Brunswick dock; if it goes across the rails into that dock we pay 6*d.* there, and at the north end, where the timber traffic is, we have to cross the rails to get into the different depôts, and we pay 6*d.* there. In addition to that we pay the timber merchant 1*s.* per ton for bringing the timber to our depôts.

11,522. (*Mr. Hamilton.*) On what ground do they exact the 6*d.* for crossing the rails?—In order to get across from our station to the timber depôt we had to cross the dock railway, and to do that had to curve our line into the dock railway, and then immediately curve out again on the other side, and for that short distance of about 100 yards we were charged 6*d.* per ton.

11,523. (*Mr. Horsfall.*) That of course you get from the parties sending the goods?—No, indeed we do not; we pay it ourselves.

11,524. You make it up in the terminal charges, do you not?—It is a part of our terminal cost; but we do not get anything extra in Liverpool, which we ought to get in consideration of those high charges.

11,525. (*Mr. Glyn.*) You do not distinctly make it a part of your terminal charge?—No.

11,526. (*Chairman.*) Will you complete your answer with regard to the Liverpool complaints?—With regard to the cost of handling the timber at Liverpool, I think I have pretty well explained that it is greater than that in the eastern ports, with which they compare us. At Liverpool the timber has to be hauled along the dock rails at a cost of 1*s.* 3*d.* to 1*s.* 6*d.* per ton and the toll of 6*d.* per ton, and that is all incurred before it reaches our station. At the other places referred to by Mr. Halhead, who gave evidence about timber, namely, Hull, Bristol, and Gloucester, the same expenses are not incurred. At Gloucester I believe the waggons go into the different timber yards, where the timber merchants load it themselves, and there is no cost, except the haulage back again into the station. Then, with regard to the unequal rates, West Hartlepool was mentioned, and there is no doubt that if the same mileage rates had been charged from West Hartlepool as from Hull, West Hartlepool never could have been made a port, because the rates would have been so much higher than they are that the Hull

steamers would have prevented the steamers to Hartlepool ever being made remunerative, and it is only by meeting it in the way of charging a less mileage rate from the one than the other that the port can be kept open.

11,527. (*Capt. Galton.*) What is the advantage of making Hartlepool a port for the London and North-western railway?—It is a great advantage to the public, because a great part of the country is served from Hartlepool better than from Hull.

11,528. You mean the country near Hartlepool?—Yes, and at a large distance also.

11,529. (*Chairman.*) Has the London and North-western Railway Company any interest in West Hartlepool?—None.

11,530. (*Lord Stanley.*) You put it in this way, that if you choose to reduce your rates very low, or even to incur a temporary loss for the sake of developing traffic, which in future will be valuable, you have a right to do so, even though that may be inconvenient to some other parties who find new competitors brought into the field?—Yes; but I do not think it true that the other parties have any ground for complaint, because, as I said before, it is the gross rate that they have to deal with, not the mileage rate that the railway company charges.

11,531. (*Mr. Horsfall.*) Have not the Parliamentary Committee of Railway Companies, of which I believe you are a member, considered a proposal to submit terminal charges to arbitration under the direction of the Board of Trade, and decided upon opposing that proposal?—No; there is no Parliamentary Committee of Railways to begin with that I know of.

11,532. Will you just look at that circular (*handing a paper to the witness*), it says, "The Parliamentary "Committee of Railway Companies discussed the pro- "visions of the Bill with the Board of Trade," and so on?—I am no member of the Parliamentary Committee.

11,533. Is the chairman of your company?—There was some committee of chairmen last year.

11,534. Did they or did they not decide upon opposing the principle which I have just stated?—I do not know what the Bill was to which you refer.

11,535. This refers to the Railway Clauses Bill?—Yes; but I do not know what that Bill was.

11,536. The object of it was for very general purposes, but there was a clause proposed to the effect that when differences arose between the forwarder of goods and the railway company, an application should be made by the party complaining to the Board of Trade, who should have the power of appointing an arbitrator to decide between the company and the forwarder of the goods, and that was the clause which the railway company resisted?—I have no doubt they would resist it. That was really putting into the hands of the Board of Trade the power to deal with questions which are now settled by the companies' own Acts. They have certain powers given to them by their Acts of Parliament, and if the proposal was to make them subject to some arbitrator to be appointed by the Board of Trade, I dare say that the railway companies would oppose it.

11,537. Are you aware that the Legislature has already sanctioned that principle in one of the North Staffordshire Acts?—I do not know that it has, but it must have been under some very peculiar circumstances. I suppose with the consent of the North Staffordshire Company.

11,538. This is the clause from that Act, which I will read to you, "Besides the rates per mile, which "the company are authorized to charge for the con- "veyance of goods or minerals on the railways or "canals, they may charge for such terminal services "as are performed by them such reasonable sum only "as may be from time to time agreed upon between the "company and the person sending or receiving goods, "minerals, or other articles of traffic, or, failing agree- "ment, as may be settled by arbitration under the "Railway Companies Arbitration Act, 1859." Do you see anything objectional in that clause?—Yes, I think it is objectionable, because I do not know what may have been the particular circumstances under which the North Staffordshire Company agree to that, or the Committee put it upon the North Staffordshire Company, but as a rule I think it is objectionable. The railway companies have made their lines on the faith of certain powers granted by Parliament, and I think that it would be unfair to them to deprive them of those powers. The Act provides maximum rates, which they cannot exceed, and there is a general clause that when the company act as carriers and perform certain duties as carriers they can charge a reasonable sum, and if they charge an unreasonable sum there is the means of bringing the company before a court, and you can take the matter into the County Court; or there is Mr. Cardwell's Act, which I know provides for it being settled in the Court of Common Pleas, and by a very summary process, and that is really the remedy, if companies exceed their powers, but so long as they do not, I do not see why it should be left to the Board of Trade to say whether the company should exercise those powers which are conferred upon them by the Act of Parliament.

11,539. But if the Act specified a maximum rate for carriage, why should it not fix a maximum rate of terminal charge, for the word "reasonable" being applied to terminal charges, who is the proper party to decide whether the charge is reasonable or not?—Hitherto it has been a reasonable terminal, and I do not know that the companies would object to the maximum terminal being fixed the same as the maximum rate, provided that the maximum was a fair one. If they exceed a reasonable charge they can be taken into court, and it is not an uncommon thing that a company should have their rates appealed against in that way.

11,540. Do you think it would be fair or reasonable that a trader with a capital of a few hundred pounds, objecting that your charges are unreasonable, should have to take the case into court at very great cost to himself, or else not have a remedy?—I do not think it is a very expensive process to begin with; but an association like the Liverpool association, who can go to the expense of opposing companies in Parliament, could surely equally go to the cost of trying the case in court, because that would not be an expensive thing.

11,541. I am not speaking of a company or an association, but I am speaking of a private individual trader, with a capital of a few hundred pounds, or even a few thousand pounds; do you think it right and fair that he should be put to the cost of contesting the point with a railway company worth its millions of money, in a court in which they have the power of appeal when that decision was given against them?—I think that the means of redress are ample. I do not think it is a hardship, because it can be tried very cheaply, and can be taken to the County Court, where the cost is very little; and I have known a company taken into the County Court for an overcharge of 3*d.*, and the question was tried in the County Court.

11,542. (*Capt. Galton.*) What was that case?—It was a case at Oldham.

11,543. Was it for the conveyance of goods or passengers?—It was for the conveyance of some goods, and they took the company into the court for 3*d.*

11,544. (*Mr. Horsfall.*) Are you aware that you can only go into the court for sums under a certain amount, 50*l.* or 100*l.*?—It is limited to 50*l.*, and it is very seldom that an overcharge amounts to 50*l.*

11,545. (*Chairman.*) Has the reasonableness or the unreasonableness of terminal charges ever been questioned in a court of law?—Yes, it has been; I have known several instances of their being questioned and tried.

11,546. (*Capt. Galton.*) But you have no objection to a maximum terminal charge being fixed by Parliament, in the same way that a maximum rate is?—No; I do not think that railway companies would object to the maximum terminal being fixed in the same way as

W. Cawkwell, Esq.

13 Feb. 1866.

the maximum toll, provided, as I said before, that the maximum was a fair one.

11,547. (*Mr. Glyn.*) In fact has it not been a matter of negotiation that such a maximum should be fixed, was not the matter before the chairmen of committees some years ago, when there was an intention of introducing a clause to that effect?—That was in 1861. The question was raised, and the chairman of committees and Lord Redesdale, and I think some chairmen of the House of Lords, also met and heard evidence upon it. The railway companies made their statement, and eventually it had arrived almost at a settlement, the chairmen of committees were willing to give a certain maximum as a terminal, and the railway companies had, I believe, consented with the exception of one or two. It was almost agreed to, and then there arose a question about the terminals on coals. There was a terminal fixed for minerals, and the coal owners objected to being subject to that terminal on the coal traffic, and some of the companies objected to anything less upon the coal, and it went off upon that, all the other points were agreed to.

11,548. Leaving the amount of the maximum to be fixed, but it was not finally settled?—No, it was not finally settled. There was a maximum named by the chairman of committees.

11,549. It approached very near to a settlement, did it not?—Yes. I believe if the coal question had not arisen it would have come to an arrangement; there was not much difference between the railway companies and the chairmen of committees.

11,550. (*Chairman.*) Was it proposed that there should be a uniform terminal all over the country for the same description of goods?—It was to be a uniform terminal for the country, and another for London for general traffic, and another for mineral traffic.

11,551. (*Mr. Horsfall.*) Why would you have a separate terminal for London?—Because it is dearer to do the work in London. I am not sure whether London was made an exception to the general terminals or not; I think perhaps it was not. The question was raised, and I almost think it was conceded eventually by the railway companies to make it one general station terminal, the cartage and wharfage being still left to be a reasonable charge; that was where the companies' warehouses and wharves were used beyond a certain period, and where the company carted and performed other services outside the station.

11,552. (*Capt. Galton.*) That you would always leave to be a separate charge?—It must be so, because it varies with the locality; and I do not think that the companies would object to settle now upon some similar basis to that; they do not wish to have any vexed questions with their customers.

11,553. (*Mr. Horsfall.*) You think that they would prefer that to its remaining as at present "a reasonable "charge" with the power of appeal to the Board of Trade to appoint an arbitrator in case of difference?—I think it would be preferable to have something settled rather than to have an appeal on all occasions to any authority of that kind.

11,554. Then I apprehend you would have no objection to the rates of carriage being published, and the rate of terminal charge being published?—They would be so then, there would be a maximum rate and a maximum terminal.

11,555. But it would not necessarily be published, would it?—It would become part of the companies' Acts then, the same as the toll clauses are now. There would be a maximum for the terminal service, therefore it would be well known what the maximum gross charge could be.

11,556. Referring again to this circular put forward on behalf of the chairmen of the different railway companies, their committee allege here that the matter at issue as regards terminal charges involves a revenue of certainly more than 2,000,000*l.* a year. Does this sum represent the terminal charges on all traffic or upon goods and minerals only?—I do not know, but I should think that it cannot represent the terminal charge on all the railways; that must be far beyond 2,000,000*l.*; I should think that on the London and North-western line alone it must be 1,000,000*l.* a year or near upon it. I am speaking of course without figures, but it must be a very large amount.

11,557. They further allege that the expenses of a certain company, with relation to stations and all matters that are covered by terminal charges, exceeded 159,000*l.* for the half year ending the 31st of December 1860; was the London and North-western the company referred to?—I do not know; it could not be the London and North-western, I think, because the London and North-western charge would have been more than that.

11,558. (*Mr. Glyn.*) Mr. Thompson, the member for Whitby, was the chairman of that committee, was he not?—Yes, he was.

11,559. (*Mr. Horsfall.*) The extent of your line is now 1,209 miles, is it not?—It is 1,270 miles.

11,560. (*Lord Stanley.*) That includes, I suppose, all the dependent lines—the whole system?—It is the London and North-western line and the lines leased by that company.

11,561. But there are one or two cases in which I think you have a joint ownership in certain lines with other companies, do you include those lines?—We are joint owners, with the Great Western Company, of the Birkenhead, the Shrewsbury and Hereford, and some other lines in connexion with them, and where that is the case we only reckon half the mileage, so that it makes the mileage correct. I may state that the London and North-western Company have spent on station accommodation alone since 1849 nearly 2,500,000*l.*

11,562. (*Mr. Horsfall.*) The expenditure upon your lines in 1863 is set forth as follows, in a return to Parliament:—Maintenance and renewal of way 421,863*l.*; locomotive power, 672,294*l.*; repairs and renewal of carriages and waggons, 180,656*l.*; rates and taxes, 88,534*l.*; Government duty, 71,224*l.*; compensation for personal injury, 20,000*l.*; compensation for damage and loss of goods, 24,118*l.*; legal and Parliamentary expenses, 52,905*l.*; traffic charges, coaching, and merchandise, 750,752*l.*; miscellaneous expenditure, 131,064*l.*; under which of those heads do you include terminal charges?—They are included under a good many of those heads; there are the goods expenses, the permanent way, and a variety of other departments forming part of the terminal expenses.

11,563. Can you state the per-centage of terminal charges of each amount applicable to goods and to passengers?—No, I cannot. I may state that the London and North-western Company has 445 miles of sidings upon its system. At Camden alone we have 14½ miles of sidings. The cost of stations and sidings and the work done in them is a very serious item to railway companies. We have above 20 miles of sidings at Liverpool. The whole are not yet completed, but we are just completing some at Edgehill now, and when those are completed we shall have about 21 miles of sidings at Liverpool alone.

11,564. (*Chairman.*) Do you conceive that the remuneration for that outlay only comes back to you by the terminal charges?—Certainly; the outlay and expenses I have named are altogether in the goods department, and are independent of the sidings that are necessary for the passenger traffic.

11,565. (*Mr. Horsfall.*) The average length of carriage upon the London and North-western Railway Company's line is returned by you, I believe, as 32 miles?—I do not remember. I think we give it in some of our returns.

11,566. On all other railways in England and Wales the average is 33 miles, is it not?—I do not know. I have not gone into those figures. I dare say I can tell you what our average goods mileage is.

11,567. What is it as regards minerals?—I have not got that here.

11,568. (*Lord Stanley.*) What is the amount of the capital of the London and North-western Railway Company?—44,000,000*l.* is the capital, 8,000,000*l.* of which is for station accommodation. We keep a separate account of the cost of the maintenance of all our

principal stations, and we find that amounts to 29,000*l.* a year. That does not include some of the smaller stations.

11,569. (*Chairman.*) That I presume is included under the head of permanent way ?—It is.

11,570. (*Mr. Horsfall.*) Supposing all goods to be delivered at and taken from your stations by the owners at their own cost, would not an average charge of 6*d.* per ton at each end cover the actual terminal charges on goods, and 1*d.* on minerals ?—No, certainly not.

11,571. Would 8*d.* per ton ?—No. I think the expenses would be increased rather than decreased by it, and for this reason : Take London. Our present practice is to take first the trains which bring the most important traffic. For instance, a train from Manchester and a train from Nottingham and those places whence traffic is sent for the wholesale warehouses and shops, which requires very prompt delivery ; those goods are put into the warehouse in the morning, and are loaded into the vans, and the vans are sent out into the city for delivery ; the empty waggons are then put on one side, and we take in another set of trains next in importance and they are dealt with in the same way. By that means all the waggons at our stations during the morning get cleared and are ready for loading again at night. If the public carted their own traffic away we should have a number of carts coming in the morning, each wanting goods from a different truck. We should have to get in a truck for one man and take a truss or two out of it and put the truck back again, and get another in for somebody else, and get a crate or something out of that and a few parcels from another. We should never get our waggons unloaded during the day ; the stations would be blocked with half-loaded waggons being taken in and out of the warehouse and kept there all through the day. It is not possible that we could take goods of that kind out of all the waggons into the warehouse, because if we did that then as great a difficulty would arise. If a cart came for a particular article perhaps it might be at the very bottom of a pile of goods, and before you come to that one you must turn the whole over for it. A company could not conduct its business on that system. The same remark would apply to other stations in a less degree, but at our large stations it would not be possible to get through the business upon such a principle.

11,572. (*Mr. Glyn.*) In point of fact, the large houses in London require the delivery of their goods in the least possible time ?—They do. We have vans waiting and a staff of men very early in the morning. We have empty vans ready, and a selection is made, as I said before, of the Manchester goods and the Nottingham goods which require the most prompt delivery. They are loaded into vans and despatched at once, and the vans that contain the goods that are taken out of those trucks which are not wanted for such prompt delivery, such as for private residences for instance, are kept on one side, and those that require the earliest delivery are despatched first. That is a matter of the greatest importance, because if we do not get to the warehouse before 9 o'clock or some hour fixed by the merchant, he will not take in the goods at all; indeed he cannot, because he wants the goods to be unpacked and put out for sale for the day ; and if he cannot have them in before that time he cannot take them at all, and we should have to take them back again to the station. But if the goods were taken away by the public they would cart those which would pay them best, and the remainder they would leave to the company to cart. There would just be a selection made of that traffic which would pay the best, which would be fetched away by the public, and that which would not pay would be left to the company. Then we could not collect our goods in the same way ; if we were merely to collect and not to deliver, the cost of collection in London, if we had to do it without the balance of loading outwards, would be so great that the expense to the public would be far greater than it is now.

11,573. (*Mr. Horsfall.*) When you were on a former occasion before the Commission a memorandum was put into your hand alleging that 12 witnesses and agents who had come from Liverpool to oppose an "omnibus" bill of your company's had paid 42*l.* for conveyance 4,800 miles, and that had they lived in Belfast you would have conveyed them 8,400 miles, and charged 30*l.* ; can you explain that ?—That is just another case of competition. That includes a sea journey to begin with ; it includes the mileage between Belfast and Fleetwood by steamer ; it was not from Liverpool. The one is the railway charge throughout, and the other is the charge made between Belfast and London, including the passage across in the steamer from Belfast to Fleetwood, and the rates from Belfast are low in consequence of competition ; but the Liverpool rates are not higher than other rates in the same neighbourhood. Take Manchester and such places, Liverpool is in no worse position than the other Lancashire towns.

11,574. Do you not think that the effect of a system of amalgamating various schemes into what are called Omnibus Bills is to make it much more troublesome and costly for traders and landowners to state any grievances which they may have to Parliamentary committees ?—No, I do not see that it does ; I should think that it would rather tend to save them trouble, because if they get the one Bill they get all the small matters of the company at once ; whereas if they were put in separate Bills they might very easily be overlooked. A particular thing might be included in one Bill which the party interested might not get, but by an Omnibus Bill they have before them at once all the small matters that the company are going for. Large matters, of course, are usually taken in separate Bills ; but if they had to pay the expense upon separate Bills for small matters the Parliamentary cost would be something enormous.

11,575. (*Mr. Glyn.*) Would it not often happen that different matters which are included in the Omnibus Bill would be sent to separate groups, and in that case it would be much more expensive to the parties to oppose ?—Yes.

11,576. (*Mr. Horsfall.*) Can you suggest to the Commission a classification of goods such as is in use in the railway clearing houses, and a graduated scale of distance applicable to all goods, minerals, and cattle traffic which would be fair and reasonable over the whole kingdom, and upon which the opinion of the trading interests could be taken ?—I think it would be a very difficult thing, that is as I understand it, to make an inflexible rate to apply all over the kingdom.

11,577. (*Capt. Galton.*) Is it not rather to make an inflexible classification ?—No, it is a rate, as I understand it to be put by the honourable member.

11,578. (*Mr. Horsfall.*) My question had reference to the classification of goods ?—I do not think that there would be a great difficulty in fixing a general classification. The railway classification is intended to be as general as it can be, of course it is capable of improvement, but I do not think that it would be for the benefit of the traders that companies should not be allowed to alter from one class to another, because if so a company could not quote a reduced rate if the traffic is large. Take the cases that occur at Liverpool, where we have made special rates to take the traffic to Liverpool for shipment, if we were not allowed to move some goods of a higher class to a lower class, we could not meet those special cases.

11,579. (*Capt. Galton.*) If you made a special rate why could it matter which class you put the goods into ?—Then you must make a special rate and take the article out of the class. For instance, if you placed iron in a particular class, and you wished to reduce the rate from South Wales to Liverpool on that iron for the purpose of shipment, you must either take it out of the class and make a special article of it altogether for that particular purpose, or else put it into a lower class where there was a lower rate charged. You could not for the sake of reducing the rate on iron go and reduce the whole class, therefore you must make it special by taking it out of the class altogether or move it into a lower class.

11,580. (*Lord Stanley.*) Does not that entirely do away with your idea of the possibility of a general

W. Cawkwell, Esq.

13 Feb. 1866.

classification, because if any article which railway companies and traders think convenient may be taken out of the class to which it belongs clearly, your general classification exists only in name?—That is so as far as the actual practice goes. We are obliged to make those exceptions sometimes to meet the particular circumstances of trade. I would mention a case which occurred at Coventry and Nuneaton: When the Coventry ribbon trade failed in consequence of the alteration caused by the treaty with France, some parties came to us who were desirous of establishing a cotton factory at Coventry and another at Nuneaton, and they wanted a special rate made for cotton from Liverpool and also for yarn back to Manchester when it was spun. We made special rates for them, and they have built cotton factories at both those places, whereas if we had been compelled to keep those goods in a particular classification and to reduce the whole of the Lancashire cotton rates to the same mileage that we charged to Coventry, we could not have afforded to do it, because it would have involved a loss upon the whole of our Lancashire trade merely to make a low rate to Coventry. Therefore we were obliged to make the Coventry rate a less mileage than from Liverpool to Manchester and other places.

11,581. (*Mr. Glyn.*) You made a special rate for that traffic?—Yes; and the same with the yarn back again.

11,582. (*Capt. Galton.*) But without being prohibited with regard to making articles special when it suited your purpose, do you think it would be advantageous to the public that the classification of goods so far as the maximum rates are concerned in the Act of Parliament should be uniform over the whole country?—It would be applying the tolls in the Act of Parliament to the railway classification in some form or other.

11,583. Is it not the case that every Act of Parliament now has a classification?—They have a classification, but not to the extent of the railway classification.

11,584. Is it not the result of the classification in separate Acts that it is utterly impossible to compare what the maximum tolls upon the different railways are?—In the case of some articles it is so. A great many articles are not enumerated in the toll classes.

11,585. Is it not the case that what is put in one class in one Act is put in another class in another Act?—Yes; and very likely that is done to meet the trade of a particular district. For instance, a line traversing a great iron producing district may be required to have a low rate for that particular article, but, generally speaking, the classification is the same on all lines.

11,586. (*Mr. Glyn.*) Do not you think that from the experience which has been now acquired from a good many years working of railways a new table of classification might be prepared with advantage both to the public and to the companies?—I think it would be quite possible to revise the railway classification in a way that the tolls might be applied to it in lieu of the toll clause in the Act of Parliament, the railway classification being revised, and the tolls being so applied that the railway companies should have something like the maximum rates that they now have.

11,587. (*Capt. Galton.*) Practically you would, I presume, take the clearing house classification with a modification?—I would take the present clearing house classification modified and so arranged as to make it as generally applicable as possible.

11,588. (*Mr. Hamilton.*) Are the Commission to understand you to say that you would not like to have the classification made binding on the companies by Act of Parliament?—It might be made binding as a maximum the same as the toll clause is now. A maximum toll should be applied to railway classification in lieu of the table at present in the Acts of Parliament. The companies then would have the power of charging less but not more

11,589. (*Capt. Galton.*) In fact you would leave them as they are as to their power of reducing their maximum?—Yes.

11,590. You would fix the maximum according to a modified classification of the clearing house scale?—Yes, I do not think that railway companies would object to that being done. It appears to me to be a fair settlement of the question.

11,591. (*Chairman.*) Do I rightly understand you to say that you think there ought to be some classification applicable to the whole country, or that there are particular cases in which deviations from the classification in use would be justified by the circumstances of particular districts?—I think that a classification might be made applicable to the whole country.

11,592. Did not you state that there were cases in which you thought that a different classification would be justified by the circumstances of the country?—I was going to observe that I think you might make it applicable to the whole country as a maximum, leaving it to the railway companies to charge less than that maximum if they thought proper.

11,593. (*Capt. Galton.*) The South Staffordshire people, in the remarks which they made before the Commissioners, suggested that a rates office should be established in order to publish the rates that were made in each district, do you think that that would be possible or advantageous?—I do not think there would be any advantage in that.

11,594. The object as we gathered was that any trader then should be able to know what rate was being charged to any other trader?—I really do not see the advantage of that. It would be a very great difficulty with the companies, because rates are continually being altered, and must be so from time to time to meet the traders, and I do not see the advantage to them in publishing rates other than those concerning their own goods.

11,595. Upon the alteration of rates are they altered to all traders of a like trade?—Yes.

11,596. Or does any trader ever get a special rate for himself without its being communicated to other traders?—It is a very rare thing if it is so; as a rule we do not give special rates of that kind; at any rate if we make a particular special rate for a particular class of goods or for a particular article, it is applied to all traders at the same place. We have one or two special rates of that kind, but they are to meet competition; that is to say, they are to meet similar arrangements by other carriers. The water carriers, for instance, between Liverpool and Manchester have one or two special rates, and we have to do the same. If they carry traffic at a particular rate we must carry it at the same rate.

11,597. (*Lord Stanley.*) Do you make special rates for individuals?—We have made special rates for individuals; but I do not know of more than two or three on the whole of our system. The London and North-western Company have set their faces against it.

11,598. Are they given upon the ground that those individuals bring a larger traffic upon the railway than any other?—Yes; it is so. A case that strikes me at present is that of a drysalter in Manchester, who deals very largely in dye woods; that house has always had a special rate for dye woods, and it is about one of the only cases that I know of; there are one or two others in the same district, but they are very few.

11,599. (*Mr. Glyn.*) They first had a special rate with the canal, had they not, and then with the railway company?—Yes.

11,600. (*Mr. Horsfall.*) Have you not a special rate with regard to Bass and Co.?—No. We have an agreement with Messrs. Allsopp, the brewers, but that is applicable to all the rest of the trade at Burton.

11,601. It is a special rate, is it not?—It was an agreement with Messrs. Alsopps to carry their traffic at certain rates; but we have thrown it open to the whole of the trade at Burton; and we charge everybody at the same price. It is a special rate.

11,602. (*Capt. Galton.*) Do all the railway companies that you are aware of act in the same way as far

as your experience goes?—I think it is very general now not to make special rates except for an article, not for persons.

11,603. (*Mr. Glyn.*) What notice do you give of any change of rates to the traders in a district?—The general rule is a month's notice. Notices are given to the end of the last day of the month, if it is the 2nd or 3rd of the month, we give it to the end of the month; but as a rule we consider a month's notice the general thing.

11,604. How do you make the change known?—By circulars to our customers. We know them by their having accounts in our books, and we send out circulars to them, or else if it is a general alteration, for instance, when we alter the rates between Liverpool and Manchester, if it involves a good many alterations, we give notice in the papers, by putting an advertisement in to say that on a certain day the rates will be altered between Liverpool and Manchester, and that particulars may be obtained at the different offices of the company and the carriers; I believe that that is the almost universal practice amongst railway companies.

11,605. (*Capt. Galton.*) Do you always give a month's notice if you raise the rates?—Yes; not if we lower the rates.

11,606. (*Mr. Glyn.*) I presume that you would not charge the large customers, with whom you had made an agreement, any increased rate?—No, if we did they would not pay it. They know the custom as well as we do.

11,607. (*Mr. Horsfall.*) With regard to passenger traffic, would any great increase arise in passengers from a large reduction in the ordinary passenger fares?—That would entirely depend upon circumstances.

11,608. You have seen a proposal to charge 3*d.* for first-class, 2*d.* for second-class, and 1*d.* for third-class per ticket as a station charge, and thereafter 1*d.* first-class, $\frac{3}{4}d.$ second-class, and $\frac{1}{2}d.$ third-class per mile by all ordinary trains, with a proportionate increase for express speed, would such a reduction materially increase the amount of passenger traffic?—No, I do not think it would materially increase it. I can quite conceive that if any one company made a reduction like that to large towns, say between Manchester and London, or elsewhere, it would increase the traffic there between those towns for a considerable time, and that it would draw traffic away from adjoining places where the same reduction had not been made. But if it was made over the whole country, and therefore traffic was not drawn out of its ordinary course by a reduction of that kind (which it always has been when those low rates have been made), I do not think it would very largely increase the traffic.

11,609. (*Mr. Glyn.*) You had an example of the operation of that sort of reduction, had you not, in the competition between the Great Northern and the London and North-western some years ago from Manchester to London?—Yes.

11,610. If I remember rightly it drew a very large amount of traffic from off the other lines to the point at Manchester?—That was a case in point. A passenger from Huddersfield came to Manchester to go to London, and he even came from Leeds, and from a greater distance than that, and so from all the East Lancashire district, the traffic within a certain circuit was all drawn to Manchester, and was considered as Manchester traffic, but it was not so, for a great deal of it was traffic belonging to other towns, and if there had been a similar reduction made to other places, the increase would not have been anything like what it was between Manchester and London.

11,611. (*Mr. Gower.*) Has every change in the rates to be authorized by the board of directors?—No, not on all occasions. Of course we submit to the directors the alterations that are made for their sanction.

11,612. But it is in your discretion to alter the rates?—Yes, we reporting to the directors what has been done.

11,613. (*Mr. Glyn.*) You would not carry out any great change, would you, without reporting it to the committee of directors?—No. Any alteration that we make goes monthly before the directors, and if it is anything serious, their special attention is called to it, and the matter is explained. Of course it is all subject to the sanction of the directors, and if they choose to reject it they can do so.

11,614. (*Chairman.*) Have you ever made any experiments on a considerable scale as to the effect of the reduction of passenger fares?—Another company that I was formerly with did try the experiment, but they discontinued it because they found that it did not answer, and it was in a very populous district too; it was in a district very favourable for the trial.

11,615. (*Capt. Galton.*) Between what towns was it?—It was in the Lancashire and Yorkshire district.

11,616. What sort of a reduction did they make, do you remember?—They made a very considerable reduction.

11,617. In third-class fares?—They ran, if I remember rightly, third class by almost every train at the Parliamentary fare.

11,618. Do you think that by affording more facilities than you do for third-class traffic in the way either of a larger number of trains or return tickets, or other methods, you would get a large increase in that traffic?—No, I do not think we should. I think that railway companies now increase the traffic whenever they can, and that they give facilities whenever they find that it will increase the traffic, their object being to increase their receipts as much as possible.

11,619. Do you think it would be advantageous to the companies to reduce the fares and not have excursion trains, which has been suggested very often?—I myself am not favourable to low excursion fares.

11,620. You would have no excursion trains?—Yes, I would have excursion trains at very moderate fares at proper times, at holiday times and those times; but I do not think that much good is done by making excursion trains so numerous and frequent. I think it is an inducement for a great many people to take advantage of them and take long journeys, which they can very badly afford to do; the labouring classes spend a great deal of money in that way sometimes which would be better spent at home.

11,621. (*Mr. Glyn.*) Does not it also interfere with your general receipts by the ordinary trains?—Yes.

11,622. (*Capt. Galton.*) Is it not the case that many people who are coming up to London wait for excursion trains and come by them rather than by the ordinary trains?—Yes, that is the case by the present system. We run excursion trains between Manchester and London perhaps three or four times a month, or sometimes once a week, for a certain period of the year, and a great many of the regular passengers so arrange as to come up by those trains.

11,623. Do not you run excursions almost every Monday from Birmingham to London?—No, not every Monday; but in some cases we do run weekly trains.

11,624. (*Mr. Glyn.*) That is during the summer, I presume?—During the autumn.

11,625. (*Mr. Horsfall.*) How do you regulate your charges by those excursion trains?—We have a scale of charges.

11,626. Is it so much per head?—So much per mile for each passenger.

11,627. (*Chairman.*) Are your fares uniform over your whole system, or are they lower in a populous district compared with what they are in a thinly peopled district?—They are pretty uniform. In some particular cases we charge a little lower fares, but generally speaking they are of a very uniform character over the London and North-western system.

11,628. (*Capt. Galton.*) Do you consider the excursion traffic a very profitable traffic?—No, I do not.

11,629. After paying for the train and everything you do not clear much?—I think that if companies took the whole circumstances into consideration they would find that they are not profitable. There is a great deal of empty running to begin with, then you have your carriages to collect together and take to the place where the trains go from, and then you have to

W. Cawkwell, Esq.

13 Feb. 1866.

take them back empty when you have taken the excursion passengers, and to bring them again to fetch the passengers back, so that all circumstances being taken into consideration I do not think that there is much profit gained out of excursion traffic.

11,630. The excursion traffic which pays is that which runs from the Lancashire and Yorkshire district to the sea coast for the day and back, is it not?—Yes, where you take them there and back in the same day it pays the best. But where you take them and give them four or five days or a week, and have to run your trains twice over, the receipts are eaten up by the working expenses.

11,631. (*Mr. Hamilton.*) Why do you do it if that is the case?—It has become the custom amongst railway companies, and one does it because another does it I believe; I do not think it is on account of the profit.

11,632. (*Mr. Horsfall.*) I think that you did not state what the mileage rate of your excursion traffic was?—It varies according to circumstances; it varies according to the nature of the traffic, whether it is one day or three days or seven days, and the number of passengers that are likely to go.

11,633. (*Chairman.*) Are your rates usually adopted upon a general system, or do you look at each individual case separately?—We do adopt something like a principle, but in carrying it out we look at the circumstances of the case.

11,634. Do you consider uniformity to be the general principle, and deviations from it to be exceptional, or is it the principle, to adopt different rates in almost every different case?—Uniformity is perhaps the principle, or an attempt at uniformity as far as we can; but after we have once got rates into operation we always find that we have to make a great many alterations, and to make special rates so as to meet the circumstances of the district after the system has worked for a while.

11,635. In fact uniformity exists to a very small extent in the charges for goods on your line?—Yes, where the traffic is large that is so, but where the traffic is small there is something more approaching to uniformity, because there is not the same objection to the rates.

11,636. (*Earl of Belmore.*) With regard to passenger fares, would you charge the same rate per mile for a short distance, say of 25 or 30 miles, as you would for a distance of 100 miles?—Generally speaking passenger fares are upon the mileage principle, but the ordinary parliamentary tolls for passengers for long distances are varied in the same way that the goods rates are.

11,637. (*Chairman.*) Are you of opinion that equal mileage rates would be very injurious to the public?—I am decidedly of that opinion. If you were to attempt to enforce uniform mileage rates the public would suffer very much. Take the article of coals to London for instance, at present London is supplied with coals from the Midland district, and it is supplied from our Wigan district, and it comes from the North-eastern district to a very considerable extent, and from Derbyshire, and from the other coal producing districts. If you were to adopt uniform rates the north country coal by railway would be entirely shut out, it could not come in at all, and the supply of London would depend upon the nearer collieries, that is to say, the Midland and perhaps Wigan coal might come in, but it is very doubtful whether it could if it were a precise mileage charge. As soon as the railway companies had advanced their rates from the north of course the steamers would do the same, and you would have higher sea freights, and the price of coal in London would be very considerably advanced.

11,638. (*Capt. Galton.*) Before we had the railways into London carrying coals in very large quantities, the rates were very much higher than they are now, were they not?—Yes, the cost was very much higher. There is the Great Western Railway, who are now bringing coals from South Wales to London at a very low price, and their traffic is very much increasing and likely to become a very important traffic, but if they were to be obliged to reduce all their coal rates to the price they are carrying that traffic to London they could not afford to do it. Therefore London would be deprived of the competition of the Great Western for the coal traffic to London.

11,639. Will you explain why they can afford to carry the coal to London at that cheap rate?—If it leaves them any profit at all they will carry it.

11,640. Is it necessary that they should have the coals in large train loads and over long distances of line?—Yes, that traffic always comes in full train loads, as much as an engine can draw in fact.

11,641. Have you any competition now with any company for coal traffic except that sort of competition which you are describing, namely, the competition between districts; is there any company which carries from the same colliery as you carry from in competition with you, or do you have an agreement with them as to rates?—I do not know that we carry from the same collieries as other companies carry from at any place scarcely. From the Midland district we carry in connexion with the Midland Company, that is to say, they make through rates with us by way of Rugby to London, and we carry on our own traffic from Wigan. We shall to some extent have competition with the Great Western Company from the South Staffordshire district to London, but much coal does not come from there, except the Cannock Chase coal.

11,642. Have you an agreement with them as to the charges to be made?—Yes.

11,643. So that practically there is no competition?—The rates are the same by both lines, and that must be the case where there is an agreement, because they must both carry at the same rate or there would be no traffic by one line.

11,644. In the competition as between districts, your coal district north competes with the south coal district of the Great Western?—Yes, our Wigan coal competes with the Midland district and against the North-eastern from their Durham district.

11,645. (*Mr. Gower.*) Have you a large proportion of trucks that come back from London empty which have conveyed coals to London?—The London and North-western Company do not find trucks, the coal owners find their own, but all those waggons go back empty, and where you have a large coal trade you must send them back empty; they could not carry the traffic if you detained the coal waggons.

11,646. Supposing they were your own trucks, would not that enable you to carry goods back?—Not except you were taking goods to the same place, which you very seldom do. For instance, take London; the traffic in and out of London is pretty well balanced, and even if the trucks were our own we could not load many of them, and if we did we must load them to other places than where the collieries are, and then the time occupied in going there and getting back again to the colliery would be so great that practically you could not carry it out.

11,647. (*Capt. Galton.*) Is all the coal carried in the owners' waggons on your line?—On the London and North-western line it is.

11,648. Supposing that you detain the waggons on your line for some time, do you allow any demurrage to the owners?—No, we do not.

11,649. (*Earl of Belmore.*) Do you return the waggons free of charge to the owners?—We do; and the system of demurrage could not be carried out. The coals are sent by the colliery owner to his own agent, and the company have not the control of the waggons. That agent keeps them in his coal yard as long as he likes, and he is the party, if anybody, who should pay demurrage, and not the company. We could not compel him to unload the waggons. When they are unloaded they are put on our siding, and we are only too glad to get them out of the way.

11,650. (*Chairman.*) Is it the case that you always return them as rapidly as possible, as soon as the agent hands them over to you?—Yes, we do.

11,651. (*Mr. Horsfall.*) What rate per ton do you

charge upon coal ?—Our usual scale is a penny per ton per mile for distances under 50 miles.

11,652. And how much beyond that ?—From ¾*d.* to ½*d.*, according to distance; in some cases we charge less than ½*d.*

11,653. Does coal come upon your line from the Midland district now; from Clay Cross ?—Yes, it does.

11,654. The Midland Company have not taken advantage of the Hitchin line to send it down by that line ?—No, they send it by us. I think they have to pay rather a high rate for coals from Hitchin to London, if they send it that way. Any arrangement with the Great Northern Company rather applied to goods than to coals, I think.

11,655. (*Chairman.*) Have you stated all the objections which occur to you against the principle of an inflexible mileage rate ?—I think I have.

11,656. In the case of carriage on canals, would not a difficulty arise with respect to them ?—Of course it would have to be made applicable to canals as well as to railways, if it is to be a uniform charge at all, because if not, the canals would be at liberty to reduce or to raise their rates as they thought proper. Therefore, wherever we are working in competition with a canal we could obtain no traffic; we should be trammelled by being prevented from adjusting our rates to the traffic, while the canal company would be at liberty to do just what they chose; and the same with regard to the rates by sea. Take the case of the coal that I mentioned before to London; a very large quantity of that is carried by steamers between the North of England and London, and if a rate was applied to railways, it should also apply to steamers; you could not make a uniform rate unless it was applicable to other conveyances as well. I think that a good many of the other complaints that I have referred to in my preliminary statement have been answered during the discussion.

11,657. The complaints from Birmingham, South Staffordshire, and Wolverhampton are generally of the same character as those from Liverpool, are they not ? — They are generally of the same character as the Liverpool case. In South Staffordshire we have a good deal of expense also; we have the ordinary station cost there, and a great deal of the traffic we collect by boat. Many of the works are upon the canals, and we have to boat the traffic from the works to the station, at an average cost of about 1*s.* 6*d.* to 1*s.* 8*d.* a ton. That is all out of the rate, and therefore if you take the rate to London and deduct the London terminal and the terminal in South Staffordshire, the rates are not unequal. Some of the witnesses complained of the rates to Glasgow, Newcastle-on-Tyne, Hartlepool, and Middlesbro'. I think that it was Mr. Walter Williams who complained of our making low rates from those distant places; but those low rates were really made in favour of South Staffordshire, for the carriage of pig iron to South Staffordshire, which is brought there to be made into bars at their own works, and the bar iron rate is a low rate made for them, to enable them to send their iron for shipment to those eastern ports. At Newcastle-on-Tyne we make a rate of 15*s.* per ton, as stated by Mr. Williams, for iron for shipment, but we charge a higher rate for the town delivery; but that rate of 15*s.* per ton was really made in order that the South Staffordshire manufacturer might send his iron to ship there, as well as to London or to Liverpool. There is no bar iron comes back again from there, and there is no pig iron goes there.

TABLES 6, 7, and 8, showing COMPARATIVE STATEMENT of RATES referred to in MR. WALTER WILLIAMS' Evidence.

The rates for pig iron and iron ore from Middlesbro', Whitehaven, and Northamptonshire are quoted so low as to be barely remunerative to bring the raw material from those districts to enable the ironmasters of South Staffordshire to produce bar iron in competition with other markets, and low rates are given to all the principal ports for the exportation of the manufactured bars. A large proportion of the iron made in South Staffordshire is manufactured by ironmasters who do not possess their own blast furnaces, but who buy the pig iron and other raw material, for which low rates are quoted.

These calculations are made after deducting station to station terminals of 1*s.* 6*d.* at each end upon bar iron, and 9*d.* per ton on pig iron, and upon collected traffic in South Staffordshire 1*s.* per ton extra.

NOTE.—Where there are no rates inserted in the L. & N. W. column the rates agree with those quoted by the Association.

* This rate was reduced in September 1865.

† These rates were reduced on January 1st, 1866.

11,658. (*Capt. Galton.*) Was not one complaint of the South Staffordshire people that the rate for iron from South Staffordshire to London was higher than the rate from Middlesbro' to London?—Yes, and the same explanation applies as before, that from Middlesbro' to London there is a competition with the sea all the way, and therefore if the companies carrying by the east coast are to carry traffic at all they must carry it at the same rate at which it is carried by vessels, and that causes the low rate from Middlesbro'; but the rate from South Staffordshire to London is not a high rate, and I may state that at the time when Mr. Walter Williams gave his evidence the South Staffordshire rates to London were under consideration by the railway companies. I think he states so in his evidence. He gave his evidence on the 13th of December, and on the 1st of January following the rates were reduced. In fact at the time when he gave his evidence I dare say the thing was arranged, although he might not have known of it.

11,659. The rates were reduced on the principle of enabling the South Staffordshire ironmasters to compete with the Middlesbro' ironmasters in the London market?—Yes, and those rates were reduced, I believe, to the satisfaction of the South Staffordshire manufacturers. We made them a station-to-station rate in addition to the delivery rate, and that station-to-station rate is 11*s.* 8*d.* per ton.

11,660. Do you give a lower rate for iron to be shipped in London than for iron to be delivered in London?—No, we make it one rate to London.

11,661. But for some articles, salt for instance, you do give a lower rate, do you not?—Yes, we do in some cases give a lower rate, when the article is intended for shipment than when it is not. South Staffordshire iron comes in about equal proportions for shipment and for town delivery; but of course for the town delivery the cartage would be added in addition to the 11*s.* 8*d.*, but if they chose to charge it on station-to-station rates on undamageable iron, they get it at 11*s.* 8*d.* a ton, and damageable iron at 14*s.* 2*d.*, and 10*s.* for pig iron. Then to Poplar, which is in fact the point of shipment, we charge 15*s.* for pigs, 16*s.* 8*d.* for undamageable, and 19*s.* 2*d.* for damageable iron.

11,662. (*Capt. Galton.*) In forwarding goods, do you undertake to deliver them within a specified time?—No, we undertake to deliver them in a reasonable time, but not in a specified time.

11,663. Would there be any objection to your being bound to declare the time in which you will deliver them?—It is generally understood between railway companies and the merchants what a reasonable time is. For instance, from Manchester to London we deliver the following morning.

11,664. We have had some complaints before us of the long time which goods take to be delivered; for instance, that it took three or four days from Birmingham to London; what have you to say about that?—Then there must have been something extraordinary, and that it is a thing which you could not provide against even if you fixed a definite time to deliver in. There must have been either some accident or some mistake or something of the kind, because they would not be three days in transit between Birmingham and London under ordinary circumstances.

11,665. (*Mr. Glyn.*) In fact the competition between Birmingham and London would keep you right upon that point?—Yes, and all over the kingdom where there is any amount of traffic. We have no complaints from the public against the present system. Generally speaking, the public are very well satisfied with the competition which is now existing.

11,666. (*Earl of Belmore.*) When you receive goods at Liverpool from any of the steam-boat companies from Ireland do you forward the packages, not for traders but for private individuals, at once, or do you keep them until it is convenient to yourselves to send

them on?—They are forwarded at once; there is no delay with them.

11,667. Is that the case with all railway companies do you suppose?—Yes; it is possible that a small article might come for a place which there were no other goods for on that day, and the company might have a waggon going there the next day, and the article might be left over until the next day, and it would go quicker by that means than by being sent part of the way that day and transferred and sent on afterwards, but as a rule we clear out every night. We do not always do so at Liverpool for this reason, that the goods are generally delivered to us late there, they are carted to the station by the town carters, and those carters are principally employed in the earlier part of the day in delivering goods for shipment, custom house goods, and after those hours they have generally a good deal of carting to the station. A great deal of our traffic is received after 4 o'clock in the afternoon and up to 6 or 7 o'clock, up to the time of closing the station in fact, and therefore some of those goods cannot be shipped and sent off the same night.

11,668. But they would be sent the next day, would they not?—Yes. Then we keep a staff of men working the greater part of the night in order to load them as far as we can.

11,669. Then it is not the fault of the London and North-western Railway Company if packages for the north of Ireland almost invariably take a week for delivery from Euston Square?—No; it cannot be that they are that time on the railway.

11,670. On the whole journey?—But as far as the railway companies are concerned, both we and the Great Northern and the Great Western Company also all carry from Liverpool to London, and we send trucks every night. Therefore whatever goods are delivered to us within business hours would be despatched the same night.

11,671. (*Chairman.*) Have you formed any opinion as to whether any changes in the general policy of the Legislature with regard to railways is desirable; for instance, with regard to the encouragement or discouragement of competition; is that a question which you have considered?—I have no objection to give my answer to that, which is that I think that Parliament has perhaps granted competing lines which they ought not to have done, and that if there had been fewer competing lines and the companies had been protected from that improper competition, then Parliament might have retained some control over the charges. But the opposite policy has been pursued, and competition has become so common now that I do not see what you can do but go on as you are. We have not a town on our line of any importance where we have not one or two rival companies, and three or four in some cases. The system of competition has been carried to such an extent that it is scarcely possible to alter it.

11,672. Then as matters now stand you think that the system of encouraging additional competition ought certainly to be proceeded with?—Yes, where the traffic would warrant new lines being made. There are certain cases in which we think it hard that competition lines should be allowed. For instance, it has become a not uncommon thing for a new company to start up and propose a line between two large towns, making their lines short of the places, and joining the lines of the other companies who have spent all their money in providing for that traffic, and then seeking running powers over that other line for the short distance, and using their stations, and by that means taking advantage of the capital spent by the original company to compete for the traffic without spending a like sum themselves. I think that is very hard upon companies.

11,673. (*Mr. Gower.*) But that goes beyond the principle of absolute competition, does it not?—As far as competition is concerned I think it has gone too far now to be altered. I do not think it is possible that you could alter it.

11,674. (*Mr. Hamilton.*) Several witnesses deny that such a thing as competition between railway companies trading between the same places is possible, are you of that opinion?—The competition of rates does not exist to any extent; but the competition of accommodation does, and the public no doubt have the benefit of that competition.

11,675. But competition virtually exists, does not it, by way of combination and agreement, by means of which the public get a lower rate than the old rate?—Yes; no doubt they do in many cases. If that competition did not exist the companies could have afforded to have carried at lower rates than they can now; but if they are to have competition they must at least be allowed to regulate their own rates, and make the best they can of the circumstances as they are. And to show that the rates are not unreasonable the London and North-western Company's dividends for the last 10 years have only averaged 4*l.* 19*s.* per cent., which is not an unfair return for the amount of capital expended.

11,676. Do you attribute that to competition?—No doubt of it. If the London and North-western Company had not been subjected to competition to which they are now exposed, their earnings would have been greater and their dividends higher.

11,677. You mean if they had charged higher rates or carried more traffic?—Or carried more traffic. The traffic between all the more important towns upon our line is now divided with somebody else. Between Manchester and London there are three companies now, and there will shortly be four; and there are three, and there will shortly be four companies between Liverpool and London.

11,678. Then you would not admit that the public have not had the benefit of practical competition between railway companies?—No; I say that they have had the benefit of competition in railways to a very great extent. There is of course the competition which I say is beneficial to the public now between different places, because although we may carry between point and point with another company at the same price, yet we may carry from another place common to ourselves only to the same market at a lower price than our ordinary rates. I mean that by flexible rates, and the companies being permitted so to arrange their rates as to develop the traffic, and endeavour to bring by their own line as much traffic as they can to any particular place, although there may not be competition between two given points, there may be competition between two different companies to the same places.

11,679. (*Mr. Horsfall.*) You alluded to the fact that the fares by the Lancashire and Yorkshire Railway were formerly not remunerative, did that arise from competition?—No; I think there really was very little or no competition with the Lancashire and Yorkshire Company at that time. The rates that they were obtaining at that time did not enable them to make a return to their shareholders in the way of dividend, and they applied to Parliament to have those rates advanced.

11,680. (*Mr. Glyn.*) In fact the capital laid out on the line was infinitely larger than was expected?—It was very large indeed; it was enormous. They applied to Parliament to have their tolls advanced, and Parliament granted them an advance of 20 per cent. upon everything but coal traffic. They have a higher scale of tolls than other companies, and it would be a hardship upon them to make the rates equal on their lines. They are entitled to a higher scale of tolls than other companies, and they would by that operation be reduced to the same rate as anybody else charged; that is to say, if any other company reduced to a low rate they must do the same, and there are many lines whose traffic could not be increased by reducing the rates where the traffic is small, and where any low rate which they could charge would not bring so large an amount of traffic as to recoup them for the reduction which they must make by that system.

11,681. (*Earl of Belmore.*) If you were obliged by Parliament to reduce all your rates in the way you have mentioned, would it not very much interfere with any arrangements that you have made with the lines which

W. Cawkwell, Esq.

13 Feb. 1866.

you are working at fixed rentals?—It would do so, because those arrangements have been made upon the basis of the present powers; and not only that, but it would prevent ompanies making reductions to encourage traffic. As in the instance that I have given at Coventry, if you were asked to make a reduced rate to encourage traffic, if you were obliged to reduce all the other rates upon your line for the same article, you could not do it, and I say that that would be very much against the interest of the public, who at present have the benefit of all that competition on the part of the companies in order to meet their representations. The South Staffordshire rates are all of the same character. In reality the rates that they complain of as being low in comparison to some other rates, are rates that were made to benefit their own trade. Mr. Matthews complains of the same thing in his evidence; but the same remarks apply to him. At Wolverhampton a gentleman came to represent the Chamber of Commerce, I think, or an association who objected to some of the rates. He spoke first of the rate from Wolverhampton to London for hardware as against the low rate from London to Hull for hardware; but that has happened in consequence of the sea competition between Hull and London. In the first place he made an error in the distance; he said that the distance was about twice as great as from Wolverhampton to London, whereas in reality it is the difference between 124 miles and 183 miles; and deducting the ordinary London terminals from the traffic, and the ordinary terminals at the other end, the mileage rate from Wolverhampton to London is 1·69*d.*, and from London to Hull it is 1·68*d.*; so that really it is not a large difference; but even if it was so, it is owing to the competition by sea. He complains in the same way of nails from Wolverhampton to London as against Wolverhampton to Glasgow and to Aberdeen. The fact is that the rate to Aberdeen was made low in order that they might send their nails to Aberdeen, for they do not bring nails from Aberdeen to Wolverhampton; and the same with regard to Glasgow, the rate is unequal, but it is unequal in favour of the South Staffordshire people themselves, and all those special low rates are made on the representation of the traders of different districts.

11,682. (*Capt. Galton.*) Having got a low rate to Aberdeen, they want you to reduce the London rate in the same proportion?—Yes; the quantity of traffic carried to London is so much greater than to Aberdeen, that if we were compelled to carry it on at the same low rate we should withdraw the Aberdeen rate. Those are instances put forward to make a case before the Commission if they are not properly explained; but I say on the other hand that it is just the contrary—that they are unequal rates in their favour, and not against them.

11,683. (*Mr. Glyn.*) They were made with a view to do good to that particular district, were they not?—They were.

11,684. (*Chairman.*) Do you think it would be possible for the whole railway system of England to be worked by the Government, supposing the railways could be all purchased and become the property of the Government?—It would not be in the public interest to do so, I think certainly.

11,685. (*Capt. Galton.*) Do you think it would be in the public interest that they should be all united together in one large amalgamation and worked as one concern?—I do not think it would be in the interest of the public. I believe that the public are better served now than they would be by any general amalgamation or transference of the railways to the Government. The profits upon the railways themselves might be greater by an operation of that kind, but certainly the public would not be benefited by it.

11,686. Would you prevent amalgamations between large companies?—Not in all cases. In certain cases no doubt amalgamation is good; you get better accommodation between point and point, and you get cheaper working, and therefore you are enabled to meet the public by reductions; there are a great many advantages in amalgamation.

11,687. Still there is a great tendency, is there not, for even the large companies to amalgamate now?—I am not aware that there is.

11,688. (*Chairman.*) Do you anticipate much more progress in amalgamation than there is at present, or do you think it has nearly reached its limits?—I think that some small companies may be absorbed by the larger ones, and with great advantage; but I do not think it is likely that any of the large companies will amalgamate with each other.

11,689. (*Capt. Galton.*) You mean that a large company, like the Midland Company for instance, would not amalgamate with another company?—I do not see whom they could amalgamate with.

11,690. With the Manchester, Sheffield, and Lincolnshire Company, or the Great Northern Company might amalgamate with the Manchester, Sheffield, and Lincolnshire?—I do not know that amalgamations of that kind are objectionable always; they are rather continuations of each other. I do not think it is likely that the Manchester, Sheffield, and Lincolnshire Company will amalgamate with either the one or the other, because the Midland and the Great Northern both have got facilities and running powers over the Manchester, Sheffield, and Lincolnshire line, and except the three were amalgamated together, I do not see how they could do so, or as the Shrewsbury and Hereford was, by a joint lease to the two companies, that line was leased to the London and North-western and the Great Western jointly.

11,691. (*Chairman.*) What are the causes which generally have led to amalgamation; has it been a desire to get rid of competition, or what?—An economical working by amalgamation in lieu of separate working.

11,692. Some cause must have been in operation in England which has not operated in Ireland, because amalgamation has been carried to a very small extent in that country?—Yes, the smallness of the dividends perhaps.

11,693. Can you at all say what causes have operated in England which have not been found effectual in Ireland?—I cannot explain that. There is no doubt that the Irish boards have not taken the same view as the English boards, or rather they have not been able to arrange amongst themselves.

11,694. (*Earl of Belmore.*) Has there not been this difficulty in Ireland, that the shares of a great many railway companies are not in the market, and therefore it would be very difficult to put a price on them?—I believe that in many cases the shares are not held by people in Ireland at all, and that those who are on the boards have very small interests in the company, and that the interest lies elsewhere.

11,695. (*Mr. Glyn.*) A suggestion has been thrown out that it might be expedient to have Government inspectors to go over the lines of each railway company, to see the state in which the permanent way was. Will you explain to the Commission what is the general regulation with regard to the permanent way on the London and North-western Railway as to inspection, keeping it in order, and so forth, and whether you think that a Government inspector would be required for any such duties?—I do not think that any Government inspection could be better than our own, because we have a daily inspection of our line. Our line is divided into sections; in the first place the line itself is divided into divisions, and each of those divisions have a superintendent, who divides his line into sections, and he appoints a foreman on each section; that foreman goes over the line every day and reports the state of the line every day.

11,696. (*Capt. Galton.*) Is it not to the interest of every railway company to keep its permanent way in the best possible condition?—Yes.

11,697. Far more than could exist in the case of any Government inspection?—Yes; the consequence to the company of any accident or any failure is so great that they cannot afford to neglect it; but if it were put into the hands of a public officer of the Govern-

ment or anybody else he would not have the same object, he would represent nobody.

11,698. Would not the result of having a Government inspector always going over the lines be to diminish the responsibility of the railway officials, and to place the responsibility upon the Government inspector?—No doubt that would be the case. Of course the company would be freed from responsibility, and they would look upon that Government officer as the man to be blamed if anything occurred. At present the opposite is the case; every man is responsible for his own portion of the line, and if any failure takes place from any neglect of his or from want of attention on his part he is the sufferer by it. I believe that nothing can be more perfect than our present system of inspection.

11,699. (*Mr. Hamilton.*) Would you give the same answer to that question with regard to all railway companies, or have you more in view your own highly organized system on the London and North-western Railway?—I think that every company has in the same proportion the same interest, no matter what the traffic of the line is, however small it is, if an accident happens the consequences are the same.

11,700. And you think that that practically is so?—Yes.

11,701. You think that the inspection of all lines is better left under the responsibility of the companies than if they were subject to any Government interference?—Decidedly.

11,702. (*Mr. Glyn.*) Practically you travel over a great part of England very often, do you not find that, as a rule, the lines are kept up in a very first rate condition?—I do. I believe that the railways of England are at present, generally speaking, in as good a state of maintenance as they could possibly be.

11,703. (*Mr. Hamilton.*) Do you apply that principle generally?—Yes, I apply it generally, because if it were not so the public would not use their lines. If a company neglected to keep its line in repair and had accidents from that cause, which must necessarily follow with the speed that trains run at now, or if people even felt the travelling to be rough and uneasy and the lines out of order, they would not go by that line if they had other means of going. And if one company's line was in a better condition than the other, the public would travel by that line which they felt to be the best.

11,704. Surely that is not the general case; take, for instance, the London and Brighton line, the lines in South Wales, or the Eastern Counties line, there is no competition there?—In some cases there is not competition, but generally speaking there is the means of going by other railways; perhaps, for local traffic that is not so, but a company has the same interest in keeping its lines in repair. The consequences of neglecting it are so great that no company can afford to neglect it.

11,705. Have you any experience of the state of the permanent way on Irish railways?—No; I have travelled very little over Irish railways.

11,706. You cannot say whether the same remark applies there, that the permanent way is generally kept in an efficient state in Ireland?—No; I have not sufficient knowledge to give an opinion. I should not like to speak from what little experience I have had.

11,707. (*Capt. Galton.*) The Commission have had the question of the punctuality or unpunctuality of trains brought before them incidentally, have you formed any opinion as to whether it would be possible to devise any legislative means to enforce greater punctuality than now prevails on some lines. Would it be objectionable, for instance, to grant persons who were injured by unpunctuality a more easy means of recovering penalties than they now have?—I do not see any good that would result from that. I think that companies endeavour to keep their time as well as they can.

11,708. Is it not the case that several companies do not keep their time?—No doubt some companies run more punctually than others, but perhaps that may be in a great degree owing to the nature of their traffic. If a company cannot afford to run through trains, that is to say, if the traffic will not afford a number of through fast trains, and they have to work all their local traffic by every train, there are so many stoppages at the various stations, and the passengers bring such an amount of luggage, causing a delay of a minute or two minutes at each station amongst the number of stations, that great unpunctuality is caused at the end of the journey.

11,709. Would it not be more convenient that they should give a longer time for their trains to run rather than they should advertise them to arrive at a given time, and not arrive until long afterwards?—No doubt that would be so.

11,710. Would you see any objection to the public having a right to obtain damages for unpunctuality?—But they have that now.

11,711. Is it not a right now which practically almost never can be enforced?—No. I assure you that we have no end of applications of that kind where there is unpunctuality.

11,712. (*Chairman.*) Do you pay any heed to the applications?—Yes, we do. If people can show that they have lost anything by it we pay them, and if they incur any expense in travelling, or any expense by delay, or anything of that kind, we meet it and pay it at once.

11,713. (*Capt. Galton.*) Is it not the case that railway companies resist it generally?—That depends upon the kind of claim that is made. We have the most unreasonable claims made upon us in such cases. The moment a train is late they claim not only for any expense which they may have incurred, but they also make a claim for something which they think they ought to have got. They say that they could have done a very large stroke of business if they had been in time, and therefore they make a claim for loss of business and all kind of things that companies are not liable for and cannot meet; but anything reasonable I do not know that any company objects to pay, if they are at fault.

11,714. (*Mr. Glyn.*) I presume you can scarcely state the number of actions which are threatened by people against the London and North-western Company under such circumstances?—I really forget now, but the number of actions against us for claims of that kind is enormous; there are some hundreds a year of legal proceedings commenced in some form or other.

11,715. In fact, a great many claims are settled by the company when there really is scarcely any proper foundation for them, rather than carry them into court?—Yes.

11,716. (*Mr. Hamilton.*) And are they very liberally settled?—Yes. If any case at all is made out it is met, except it is something exorbitant that we cannot meet—something unwarranted altogether; but anything in reason we always meet and pay at once.

11,717. (*Mr. L. Gower.*) Do you consider that the trains are getting more unpunctual now than they used to be?—No, it does not strike me so.

17,718. Have you any record by which you can test that; when trains are late is there a record kept by which you know it?—Yes, we keep a record of the arrival of every train upon the line, and those reports are sent in to the superintendents of all the different districts regularly, and if there is any delay occurring with a train they at once look to it and see how to remedy it. If it is a general delay from time to time, we either alter the time or do something to remedy it. These things are very closely watched by the companies.

11,719. (*Mr. Horsfall.*) You have a record at every station, have you not?—Yes, of the passage of the trains; but I am speaking now of the time of arrival and departure. The guard keeps a record of the time on his own journey.

11,720. (*Mr. Glyn.*) The traffic of the London and North-western Company is so large, is it not, that unless punctuality were the rule they could not carry it on at all?—No; in fact the London and North-western Railway is a series of railways which have been amalgamated into one, and require to be very closely watched.

W. Cawkwell, Esq.

13 Feb. 1866.

11,721. Of course no line could keep actual time, I presume ?—No, circumstances prevent it; but as a rule I do not think that the trains are very unpunctual.

11,722. (*Capt. Galton.*) You mean upon your own line?—No, I mean upon most of the large lines.

11,723. (*Chairman.*) Certain trains during some months in the summer are habitually late, are they not? —That is a chronic disease; that is owing to a great extent to the large amount of luggage which the passengers take with them.

11,724. Why do you not give a little longer time during those months ?—We cannot do that, because most of those are through trains, meeting other companies' trains at some point or other.

11,725. But then those trains must be disappointed ? —They are detained more or less in consequence of the unpunctual arrival of others. We are in the same way detained at Carlisle because the train has not come in from the North; but if we were to go away and leave that train, then all those passengers would have to remain all night at Carlisle, and rather than do that we wait half an hour and bring them on. That makes us unpunctual, but you cannot break those connexions in the summer time because the other trains are not running exactly to time. It is owing principally to the enormous quantity of luggage that we have to load upon the train before it leaves the station. Then perhaps it does not start punctually at the other station, and there are a number of passengers who have luggage going to various places on the line, in the case of people going to the seaside and other places, which has to be unloaded, and thereby causing delay.

11,726. (*Mr. L. Gower.*) Are the servants of the company in any way responsible for the unpunctuality? —We call them to account if they are not punctual; for instance, if we find a train delayed at a station beyond the proper time, inquiry is made why this delay takes place.

11,727. Do you impose any penalty in consequence upon the company's servants ?—No, we do not impose penalties. Of course, if they do not attend to their duty we dispense with them, and get people who will, but we do not generally impose fines for those things. A man loses his promotion if he is careless, and that is more important to him than a fine. There were some complaints from a gentleman, I think, at Market Harborough, about the disconnexion of trains with the Midland Company at Market Harborough for Northampton, the Rev. Mr. Field, I think it was. I have looked to that, and it is a fact as he states, that our trains and the Midland Company's trains do not generally meet at Market Harborough, but it is owing to this, that the London and North-western trains between Blisworth and Market Harborough run in connexion with the main line trains on the London and North-western railway. They bring passengers from Market Harborough and other places to go by our trains, and they take passengers again from that train to go on to Market Harborough and places beyond. The main line trains running in connexion with the trains to Carlisle and Manchester, with the Lancashire and Yorkshire and other companies forming junctions in their course, and the Midland Company have a series of trains upon their line just in the same way. This is a small cross traffic, which if we were to alter our arrangements to meet, we should throw our trains out for the large traffic upon the whole of our system. If the reverend gentleman looked at the time tables, and he does appear to have noticed it, he would see that there is one route by way of Rugby, and another by way of Wellingborough, by the Midland line. We have six trains a day in each direction, running in connexion with the trains at Rugby for Northampton, and that is the best route between Leicester and Market Harborough; and they are very good trains too, one leaving Leicester in the morning at 7.15, and arriving at Northampton at 9.25, which is short of two hours; another leaving at 9.50, and arriving at 11.35; another leaving at 11.51, and arriving at 2.10; another leaving at 4.0, and arriving at 6.20; another leaving at 6.15, and arriving at 8.25; and another leaving at 7.40, and arriving at 9.30.

11,728. (*Capt. Galton.*) That is by Blisworth, is it not?—Yes, that is by Blisworth, and they are as good trains, or better trains, than we could work over the branch line between Northampton and Market Harborough, because that is the train by which we must work the local traffic, as the train goes there.

11,729. And is the fare the same ?—Just the same.

11,730. Then the people who are living between Northampton and Market Harborough must feel inconvenience ?—Mr. Field speaks of Leicester. I may also add that the Midland Company have a junction with us at Wellingborough, and we arranged some time since the terms on which they should run to Northampton; they are making a station at Northampton, and as soon as the station is completed they will run their trains, I have no doubt, between Leicester and Northampton by that route, which will make the thing complete. That station has been delayed in consequence of the new line which they have got from Bedford to Northampton, and they are coming to Parliament this year for some little alteration in it.

11,731. (*Chairman.*) Have the Midland Company a line from Bedford to Northampton?—A line was obtained last year by an independent company in their interest, and the Midland Company are going to work it.

11,732. (*Mr. Horsfall.*) Are you aware that great complaints are made of the want of a real junction between the two companies. I do not say that it is at all times possible to remedy it, but where one company has both lines, as, for instance, the Trent Valley and the South Staffordshire to Lichfield, you have to wait three-quarters of an hour in one case, and two hours in another, if you wish to go on by the South Staffordshire line ?—That is exactly a similar case; that is on our line, and, therefore, we have no object, except to make the best connexion we can; but we have two things to meet: we have to meet the trains to Birmingham, running through by Walsall, and so on to Lichfield over the South Staffordshire line, and the traffic is far greater by that route than is obtained by any preference that might be given to some works on the Trent Valley line; and we have to look to accommodate the largest amount of traffic. If we were to alter the South Staffordshire train to meet the train on the Trent Valley line, we should throw it out of connexion with a number of far more important trains to the traffic of that district in South Staffordshire. Those are the points that we have to consider.

11,733. (*Chairman.*) You cannot prevent delays, in fact, without multiplying a number of unprofitable trains?—No, we cannot make junctions everywhere with our main line trains. The traffic of the cross trains is sometimes much more important than that which would be in connexion with the through train, and we are obliged to look to the greater accommodation.

11,734. (*Capt. Galton.*) Do you find any inconvenience from the break of gauge where you come in contact with the broad gauge?—Yes, no doubt the break of gauge is a great misfortune.

11,735. Would it promote the economy of traffic in the interests of the public if the broad gauge were removed and the narrow gauge substituted for it?— Yes, certainly it would; and I believe that one of the most important things that could be done would be to get rid of the broad gauge; it would be a very great accommodation to the public.

11,736. Do you think it is a point of sufficient importance to the public to make it worth while their contributing towards it?—I believe that if the Great Western Company could be assisted in doing that it would be a very important thing indeed. It is a great complaint in South Wales. The colliery owners there are obliged to get broad gauge waggons for the broad gauge lines, and narrow gauge waggons for the narrow gauge lines, and they have two stocks instead of one, and to them it is most important. And the delay where the break of gauge takes place is also

very objectionable. We have a station now at Hereford, where we have broad gauge traffic coming in at one end and narrow gauge trains at the other, and everything has to be transferred that is going beyond Hereford.

11,737. That involves, does it not, a large staff of porters, and other conveniences?—Yes; and the same is the case in the South Wales district in the neighbourhood of the Vale of Neath, which is now worked by the Great Western Company, and is upon the broad gauge; we run trains in connexion with it, and all our passengers have to change from the narrow gauge to the broad gauge.

11,738. (*Chairman.*) Do you think that the injury is felt over the whole country to a certain extent, or is it merely confined to the districts through which the broad gauge lines penetrate?—The traffic from that district circulates over so large an extent of country that it is a very serious matter.

11,739. All parts of the country, you think, are more or less interested in getting the narrow gauge substituted for the broad gauge?—I think that a great portion of the country is.

11,740. (*Earl of Belmore.*) I suppose that the transfer from broad gauge waggons to the narrow gauge waggons of other companies causes great delay in the carriage of goods from that district to other districts?—Yes; it causes delay and considerable additional expense and damage, and it is very objectionable in every way. If the Great Western Company had the means I have no doubt that they would do it at once. I am quite sure that they must feel the inconvenience much more strongly than we do; it is a very great subject of inconvenience to all companies working in connexion with them.

11,741. (*Mr. Hamilton.*) Have you ever formed an estimate of the cost at which that might be done?—I suppose it would cost them perhaps something like 3,000*l.* per mile.

11,742. (*Chairman.*) Would that include the stock?—No; I should think that the altering of the line, converting the broad gauge into narrow gauge, would cost them something like 3,000*l.* per mile, and of course all the stations would have to be altered.

11,743. (*Mr. Glyn.*) The Great Western Company have a great deal of narrow gauge stock already, have they not?—Yes, they have a considerable quantity of narrow gauge stock, but they would require more. I do not know whether much of their broad gauge stock could be converted into narrow or not, or to what extent that could be done.

11,744. (*Mr. Horsfall.*) I presume no alteration of the stations would be required?—Yes; all the sidings would require to be altered.

11,745. (*Earl of Belmore.*) The platforms would have to be altered in some instances, would they not. If you had a narrow gauge carriage between two platforms there would be a gap on one side?—Yes, they would require to be brought nearer together; slewing the rails would to a great extent do that, except where there is a double platform on each side; if it is only on one side, the slewing of the rails would accomplish the object, and it is a very desirable thing to do.

11,746. (*Chairman.*) Have you turned your attention to the statement of Messrs. Howard, of Bedford, in the Appendix?—Yes; I have looked at that statement, but it does not affect the London and North-western much in the rates. He makes a general complaint of the inequality of rates, but he does not state the particulars of it, except in a foot note, which is rather a complaint against the Great Western Company and the North-eastern Company.

11,747. The general complaints that affect the London and North-western Company are chiefly the want of arrangements which Messrs. Howard expected would have been carried out; have you any remarks to make upon that subject?—I will explain that. Mr. Howard makes the same complaint about the Great Northern trains not meeting with the Cambridge and Oxford trains at Sandy where they cross. That is exactly the same as the other case, it is a single line of railway, and we have to run in conjunction with the Great Eastern at Cambridge, and with our own main line at Blisworth, and so on with our own trains at Oxford. If we were to alter our trains to meet the Great Northern, with their very little interchange of traffic, we should then either at Cambridge or at Blisworth throw them out of connexion with one of the two large systems. With a single line like that, we are obliged to run to the minute, because we have to cross at a particular station on the line, so that we cannot alter the five minutes that he mentioned, or else we should miss the junctions.

Then Mr. Howard also makes some complaint about the station at Bedford; with regard to that, I may state that originally the London and North-western Company bought land at Bedford for a joint station, that is to say, for a station to be built which was to serve the two companies, and they put up a temporary station at the main road leading to Bedford. The Midland Company when they made their line, which was subsequent to the London and North-western Company opening theirs from Bedford to Bletchley, they erected a station quite at the other end of Bedford, quite away from where it was intended; after negotiations had been going on for some time for the joint station they concluded to build their own. Then the London and North-western Company made theirs a more permanent station where it was at the road. Since that we have opened a line of our own to Cambridge, and made the other a double-sided permanent station, and the Mid land Company of course have theirs at the other extreme end of Bedford, but that was not from any disinclination on the part of the London and North-western Company to make a joint station orignally, for so far from that they purchased land for the purpose.

11,748. (*Capt. Galton.*) Is it not the case that the Midland Company are now going to have a new line, so that it will be quite impossible to have a joint station, as the new line runs into their present station?—That would not affect it at all. I do not know where their Bedford line goes out.

11,749. It goes out from their Bedford station?—I am not aware whether they use the existing line for a certain distance out of Bedford.

11,750. No, they do not, I believe?—I have not seen their new line; but the reason why they built that station separately is what I have mentioned.

11,751. (*Chairman.*) There are usually no restrictions in Acts of Parliament as to where stations are to be placed, so that they are at liberty, are they not, to put their stations in any place they think proper?—Yes.

11,752. Do you think that any restrictions might be adopted where two lines come to the same town, compelling them to use the same station, or to agree about some joint station?—A good deal would depend upon the circumstances at the time. Those are things which are always inquired into by committees, and it depends entirely upon the circumstances of the case. I do not see that any good can be done by making it imperative; it might be inconvenient in some cases.

11,753. (*Earl of Belmore.*) Do you not think that a crossing such as exists at Bedford, one line crossing the other, is rather dangerous?—It is dangerous; but I do not know that it is more dangerous than other crossings which are allowed; the Board of Trade now always report against such crossings, and I do not think that it would be allowed now; they would have to build a bridge.

11,754. (*Chairman.*) Do you think it would be desirable for the public interest that they should have an opportunity of going before any other tribunal of a cheaper character than the Court of Common Pleas when they have a complaint to make against a railway company, either with reference to rates or other matters?—They have the County Court now, which is as cheap a tribunal as they can have. You never find any case where there is an overcharge amounting to 100*l.*

11,755. (*Capt. Galton.*) We have been informed by Mr. Matthews, in his evidence, that the public have great difficulty in going before the law courts; first, because of the great expense to which they are

W. Cawkwell, Esq.

13 Feb. 1866.

put by the continued appeals, and in the next place, because the railway company always would spite them afterwards, if they could, in reference to their goods, for having gone to law with them; what have you to say in answer to that?—That cannot be so, because the parties themselves have the remedy in their own hands, by depriving us of their goods. They may say, we will send our goods by somebody else. They have rather the whip-hand of us than we have of them. I assure you that they could not have anything more simple than the County Court.

11,756. (*Mr. Glyn.*) Practically the public do appeal very much to the County Courts against railway companies, do they not?—Continually.

11,757. (*Chairman.*) Do they appeal on questions of the rates which some individuals pay as compared with others?—Yes, on our charges frequently.

11,758. (*Capt. Galton.*) But the point upon which they have the power of appealing to the Court of Common Pleas is rather that the companies should carry without undue preference, is it not, and that point could not go before a County Court, or at least it would be very difficult to bring it before a County Court?—It would be doing what I say would be very unfair to railway companies, that is, delegating the powers which they have had granted to them by Parliament to be dealt with by another tribunal.

11,759. The point is this—Mr. Cardwell's Act says that railway companies shall carry without undue preference, and without giving facilities to one person over another, and that in order to have those cases adjudicated upon, the parties shall go before the Court of Common Pleas. Then the argument of the public is, that an appeal to that Court is very expensive, and that some cheaper form of tribunal would be advantageous in respect of that. Have you any reason to think that the public would be advantaged, or otherwise?—I do not think that they would be advantaged by it. There is a remedy provided by the Act, namely an appeal to the Court of Common Pleas, which is not an expensive tribunal. Besides, that is a legal tribunal, and if you take it away from them you entirely alter the Act itself, and you make it a tribunal not guided by the law at all.

11,760. (*Mr. Glyn.*) Would you not in that case have very nice legal points brought before a Court scarcely properly constituted to determine them?—Yes, and I think points which could not be referred to any tribunal except a law court.

11,761. (*Chairman.*) Are there any other points that you wish to lay before the Commission which you have omitted?—I do not know that there are. There are a number of complaints with regard to South Staffordshire, but they are all the same thing over again; they are the same matters of rates, and the way in which they have put the rates to the Commission, I think is not a fair way.

11,762. Have you any explanation to offer to the Commission with regard to Mr. Wright's statement as to parcels being charged separately as smalls, even when they are sent to the same consignee?—Mr. Wright puts the case in this way: if he sends a bundle of iron wire, some brass tubes, and some other things, each article is charged separately as a small, even if they do not weigh the weight of a small; but Mr. Wright is mistaken; it is not so. The London and North-western custom is that if there are three articles, say of that description, weighing altogether under 1 cwt., we take the actual weight of each of those articles, and charge it according to its own class, provided that if in the aggregate the charges do not amount to a sum equal to a small, the rate for one small is charged a small, and the general rule of the clearing-house is very much the same, with the exception that it is charged as Mr. Wright suggests would be fair, as a small of the highest class included in these goods, and that is really the rule, which I will read to the Commission: "When two or "more packages, each under 1 cwt., and of different "classes, are sent by one consignor to one consignee, "their weights are added together, and the rate "charged is that which, according to the classification, "would be charged if all the articles belonged to the "highest class in which any of them is placed; but "whatever the aggregate weight of the consignments "may be, no less charge is to be made than that which "is made for the maximum weight of smalls. If the "parcels be from different consignors, or from one "consignor to different consignees, involving separate "deliveries, they are charged for separately" (which Mr. Wright admits is right). "Parcels so charged shall "not be entered at the foot of invoices as smalls," and so on. That is the clearing-house rule, but we at Birmingham and on our line generally, weigh each article separately, and we charge it according to its class. If the weight of the three parcels is more than 1 cwt., then each would be charged the actual weight of its own particular class. Mr. Wright must have been mistaken somehow or other; it is our universal practice.

11,763. There was a previous question about glass; any explanations which you have not given in your evidence, will you supply hereafter if you think proper?—Yes; and I will put in some of those tables explanatory of that and other matters which I have prepared for the Commission.

The witness withdrew.

Adjourned to Thursday next, at 12 o'clock.

Thursday, 15th February 1866.

PRESENT:

The Right Hon. the Earl of Belmore.	Robert Dalglish, Esq., M.P.
The Hon. E. F. Leveson Gower, M.P.	Geo. Carr Glyn, Esq., M.P.
Sir Rowland Hill, K.C.B., F.R.S.	Capt. Douglas Galton, R.E., C.B., F.R.S.

T. B. Horsfall, Esq., M.P.	William Pole, F.R.S., *Secretary.*

His Grace THE DUKE OF DEVONSHIRE, K.G., F.R.S., in the Chair.

J. Grierson, Esq.

15 Feb. 1866.

James Grierson, Esq., examined.

11,764. (*Chairman.*) You are the general manager of the Great Western Railway Company?—I am.

11,765. You have had an opportunity, have you not, of looking at the evidence that has been given before this Commission with regard to the complaints affecting the charges on the Great Western Railway?—I have.

11,766. Will you be so good as to commence your evidence by going through the different complaints *seriatim.* And, first, with respect to the evidence given by Mr. Nicks of Gloucester, will you go through those points which appear to you to require explanation?—With regard to Mr. Nicks' evidence, it appears to me that it has scarcely as much bearing on the charges which we make, as it is expressive of the very strong desire which he has, as a partizan, I may say, in that district, to have a competing line against the Great Western, and I think he has put forward arguments in favour of that idea, with the view of impress-

ing the minds of the Commission that there are grounds for it, probably for production in some other place, and therefore I would desire to give you a few facts in reply to the statements which he has made. He himself, in answer to question 8940, states that Gloucester suffers very seriously for want of a competing line between London and Gloucester, and with respect to that I would say that the trade of Gloucester is essentially a grain and a timber trade, and that there is no such traffic as grain and timber in any quantity passing between London and Gloucester. The thing is practically impossible, except in very special cases where there is a large import of grain into London, and there is a demand on the part of the millers at Gloucester to have a small supply of foreign corn. In fact he himself, in his evidence in favour of a line called the London, Bucks, and East Gloucestershire line, which was before the House of Commons in the last session of Parliament, stated, in answer to question No. 789, "We are not likely to require them to do so; we "never send goods so far as London." That is his own statement. Therefore it cannot be for any goods traffic that he could require a second line from London to Gloucester; it could only be for passenger traffic.

11,767. (*Capt. Galton.*) Gloucester is an importing port for timber, specially, is it not?—It is an importing port for timber and grain, and being situated nearest the manufacturing district of South Staffordshire it has, to a certain extent, an advantage, and the great bulk of the trade goes in that direction, and very partially to the agricultural districts of Worcestershire on the one hand, and into Herefordshire and towards Swindon on the other; and also, though he does not quite admit that (for reasons which I believe I shall be able to show you), into South Wales. I differ so very strongly from Mr. Nicks that I should tell the Commission at once that Mr. Nicks is a gentleman who takes a great deal of interest in his district in railway matters, but unfortunately for us he has always been against the Great Western Company. In fact, during the last session of Parliament, he gave evidence on no less than six railway bills which were either promoted by the Great Western Company or in their interest, or were promoted against the Great Western Company, and therefore I look upon him not as a fair representative of the people of Gloucester, but, in fact, as a partizan coming here for a particular object. With respect to the fares between London and Gloucester, Mr Nicks's complaint is really this, that we charge express fares upon a portion of our line; that where we are in competition with the London and North-western Company from London to Birmingham we run comparatively quick trains, and that we do not charge express fares.

11,768. He complained that you charged a higher fare from Gloucester to London than you charge from Worcester to London, which is about the same distance, or rather, I think, Worcester is about a mile farther?—Worcester is about seven miles farther; the distance to Gloucester is about 114 miles, and to Worcester 121. I do not think that, as regards Worcester, he could make any comparison which would affect your minds, but as regards Birmingham he endeavoured to do so, and I would explain with respect to that that a few years ago, in consequence of the disruption which took place amongst the Northern companies, express fares were taken off on some of the lines, including towards Birmingham, and the companies have never commenced to charge them again.

11,769. On the London and North-western line they charge the same fare by all trains on every part of their line, do they not?—Except about two trains per day, upon which I believe they charge express fares. I think it is by the two limited mails, the Irish mail and the Scotch mail. It is the fact, no doubt, that we are competing with the London and North-western Railway Company between London and Birmingham, and we do not charge express fares. The London and North-western Company running a very good service between London and Birmingham, we are bound to run as good a one as we fairly can or we could get no traffic. Mr. Nicks put before the Commission that the distance from London to Birmingham is 129 miles, but he passes over this, that the distance by the London and North-western line, which governs the rate, is only 112½ miles; the distance from London to Gloucester is 113¾ miles; and, in fact, for the purpose of charging, it is 114 miles. He states to the Commission that our express fares are 25*s.* first class, and 17*s.* 6*d.* second class. At the time he gave his evidence, and for some time before, at least since the 1st of June last year, the express fares have really been 23*s.* 11*d.* first class, and 16*s.* 9*d.* second class. Comparing those with the Midland fares, which he puts forward as being much more favourable because they do not charge express fares, I find that their fares for the same distance, at least for 112½ miles, are 22*s.* 6*d.* first class, being a difference of 1*s.* 5*d.* as against the Great Western Company in that class. (There is no place of equal distance that I can find to take from Gloucester, therefore I have taken the distance and fare from Bristol to Tamworth.)

11,770. You might compare it with the fare from London to Derby?—I am comparing the fares by the Midland from the district as to which he is complaining, and I take from London to Gloucester on the Great Western line. Then as regards the second class, the Midland second-class fare is 15*s.* 9*d.* against our 16*s.* 9*d.* express, so that it is 1*s.* against the Great Western; but these fares, compared with our ordinary fares, show their first-class fare is 2*s.* 6*d.* higher, and their second class 9*d.* higher. That is without taking into consideration the difference in distance between 112½ and 114 miles. I do not mean to say that theoretically he may not have some grounds of complaint that we should charge express fares on one part of our line, and not on the other. But the question of express fares has really never yet been settled by railway companies whether they should be continued or not. So far, I have not recommended the Great Western Board to alter those fares, except upon the complaint of the Gloucester Chamber of Commerce. Further on he states that a memorial was sent to the Great Western Board, and not answered, but in going into the question we saw that the service between London and Gloucester was not as good, comparatively, as the service between London and Bristol; and upon that ground there was a reduction made, which he did not mention to the Commission.

11,771. (*Mr. Glyn.*) As a general rule, I suppose you take it for granted that, whenever two companies are competing to one particular place, the shortest route almost always governs the rates?—Yes, as a general rule, indeed it must be so where they are charging their maximum fares, which is the case between London and Birmingham, because the maximum tolls on the London and North-western line as well as on the Great Western line are the lowest in fact in force in the country.

11,772. (*Mr. Horsfall.*) What was the amount of reduction of fares to which you alluded just now?—The first-class express fare, prior to the 1st of June last, was 25*s.*, and it was reduced to 23*s.* 11*d.* For that service we run by some trains from London to Swindon, a distance of 77 miles, in an hour and a half without stopping, and then on the Gloucester and Swindon branch, stopping twice or thrice, which we do not do with all trains between Swindon and Bristol; and therefore we thought that the service being not quite so good, that they had a fair claim for some reduction until either the question of express fares was settled, or until we ran a better service. With regard to the answer given to question 8951, where he says that Hereford is put in a much better position as compared with Gloucester, because before the amalgamation of the Great Western and the West Midland lines there was a competition between London and Hereford through Worcester against the Great Western line, in making that statement he must have entirely forgotten that the Worcester and Hereford line was not opened till six months after the agreement between the Great Western and the West Midland companies. Therefore no such competition, as he states, ever existed. And therefore that had no bearing whatever upon the fares which we

J. Grierson, Esq.

15 Feb. 1866.

charge, or the accommodation which we give to Hereford.

11,773. (*Capt. Galton.*) What are your fares to Hereford regulated by?—The ordinary fares are the same as the fares from London to Gloucester, with the local fare added from Gloucester to Hereford.

11,774. The full fare?—Yes, the full fare; we do not charge express fares between Gloucester and Hereford. All our trains are stopping trains upon that line. It is used as a local line, and not at present as a through line. In question 8952 he explains for us that public feeling prevented us raising the fares. I can only say on behalf of the Great Western Company that such a thing never was thought of, and never was for one moment considered. Then again, in question 8947 there is a very small matter alluded to, but one which might induce the Commission to think that we would take small advantages of the public in such cases. I can only say that the first time I ever knew that such a mistake as he alluded to had been committed was when I saw his evidence; and when I went into the accountant's office to inquire as to it, I found that the clerk in copying out the rates had made a mistake of 1*s.* 1*d.*, and that within 13 days the error was discovered and corrected. Then further on, in 8984, he states that where we have competition between London and Exeter we do not charge express fares. I say that we do, for the reasons just explained, and upon a higher scale than we now charge between London and Gloucester.

Then in 8955 he states that certain agreements were entered into by the Great Western Company with the London and North-western Company and with the Midland Company, and in fact he infers that they were scheduled to the Amalgamation Act in such a manner that the public had not an opportunity of expressing their opinion upon the subject. It is quite true that those agreements were scheduled to the Bill in the House of Commons, but I believe that there were at least 30 petitions against the Amalgamation Bill at the time, and the agreements were fully discussed in the Lords. After passing through the House of Commons, Gloucester, Swansea, and many of the towns in the South Wales district, held public meetings, and one at least of those Mr. Nicks himself attended, and spoke against those very agreements and against the amalgamation. So that the public had the very fullest opportunity of considering the question. And I say this further, that neither Mr. Nicks nor any other person can be produced who could fairly say that the public have been in the slightest degree injured by those agreements. On the contrary, I say, that they were the best agreements, and of a new kind, that were ever entered into by railways, not giving territories to each other, but in fact to open the lines of each to the other. And I believe that no agreements have ever been made between companies which have been or will be of so much benefit to the public. They have not in the slightest degree prevented competition between the companies. I believe I may say fairly that in no case has our entering into them ever induced us as a reason to raise a rate or a fare; we have got facilities over the London and North-western line which we never had before, and we have given them to the public in our own interest; and in the same way the London and North-western Company have and will have great facilities over our line when certain lines are completed, which they of course in their interest will also give to the public. The London and North-western Company and the Great Western Company, in fact I may say since they were first incorporated, were always in a state of antagonism. We had no such thing as through booking, and we had at many places no junctions; but upon those agreements being legalised, we constructed junctions at Banbury, at Oxford, and at Leamington. We have been engaged during the last two years in making through rates and fares with them to the best of our power, and making through train arrangements (I do not say exclusively in the interest of the public), and we are most anxious that the same should be done to the very fullest extent with the Midland Company.

11,775. (*Chairman.*) Was the effect of those agreements to give mutual running powers over your lines, to a certain extent?—In our case we obtained running powers for about 4½ miles, from Nantwich to Crewe, over the London and North-western, and we obtained very strong facilities and contingent running powers from Crewe into Manchester. We gave the London and North-western Company no actual running powers, but we gave them the same strong facilities between Smethwick, near Birmingham, on the one hand, and Tenbury on the other, so as to complete a shorter route from their system between Birmingham and the south, and South Wales. That is coupled also with contingent running powers in the event of an arbitrator stating that we do not afford proper facilities. With respect to Gloucester, I say most unhesitatingly that they could not bring a person out of the city of Gloucester, who could say that those agreements have been injurious to Gloucester.

11,776. (*Mr. Horsfall.*) Do they involve any agreement as to the rate of charge?—They involve this, that the rates and the fares are to be equal; but I say that it is an impossibility that any other principle than that could be adopted by public companies. The state of circumstances as between two railway companies is as different as they can possibly be as compared with two tradesmen. In the case of two carriers upon a canal, or two coach proprietors, the one may run the other off the road, but no railway company can run the other off the road, and, therefore, sooner or later they must come to some understanding. Competition has been tried several times in this country for a short period, but in the end the companies have had to come to an agreement; and in no instance that I am aware of are there anything but equal rates and fares.

11,777. (*Mr. Glyn.*) In all those cases the rates and fares are determined by the shortest route, are they not?—They are always determined by the shortest route, as far as the maximum charges are concerned, where they are charging the maximum.

11,778. (*Capt. Galton.*) And, in fact, they are determined by the maximum Parliamentary charge of the railway company which has the shortest route?—Yes. Take the very case I was referring to, namely, between London and Birmingham; if it is fair that the full parliamentary charge should be made between London and Birmingham, of course the London and North-western distance fixes the fare, but in the case of goods, where we do not in all cases charge our full rates, then we, the Great Western Company, always say that we must have a voice in the fixing of the rates. We do not submit in any instance to another company fixing the rate, that is to say, where it is below the maximum. We say that it must be by a mutual arrangement, or, in case of difference, by arbitration.

11,779. (*Earl of Belmore.*) Have you through booking arrangements under that agreement, to any extent, with the London and North-western Railway Company?—Yes, we have through booking arrangements to a large extent, and I could show, from the books which I have brought down, what the rates are, so far as we have fixed them, but they are very far from complete as yet.

11,780. (*Mr. Glyn.*) The transference of traffic is very large, is it not?—Yes, it is very large, and increasing. There was practically a barrier between the London and North-western and the Great Western companies till those agreements were passed.

11,781. (*Mr. Hamilton.*) And the effect of those agreements has been practically to give the public the benefit of a lower rate, has it not?—That has been the effect in all cases of through booking of goods, because previously the parties had to pay the local rate to one company and the local rate to the other. I do not wish to refer to another company if I could avoid it in making comparisons about rates, but as Mr. Nicks makes a comparison in answer to question 8990 between the Great Western rates and the Midland rates, I am bound to produce this list to the Commission:

Comparative Statement of Timber and Grain Rates from Gloucester.

* These rates include collection in Liverpool and delivery in South Staffordshire.

Mr. Nicks has given you his comparison of the rates charged by the Midland Company to places in the inland district. Gloucester is situated about 56 miles from Birmingham, and supplies to a very large extent the requirements of that district in grain and timber. There is a population within 60 miles of Gloucester in that neighbourhood of about 900,000, and there is a comparatively free river navigation from Gloucester up to Worcester, the toll being only 6*d.* per ton for, I think, about 32 miles; then the traffic gets upon the canal, and there always has been a very strong competition between the Midland Company and the river for the traffic, and of course the Midland Company, with a desire to obtain a share of that traffic, have charged very low rates. As against that Mr. Nicks gives you the rates which are charged by the Great Western Company towards Hereford and into Shropshire and the agricultural districts, with a population within 60 miles bordering upon our line of railway of only 46,680, passing through all the parishes, and he adduces this as a fair comparison of circumstances showing that we charge unfavourable rates as compared with the Midland Company. We have tackled Mr. Nicks upon this subject before, and he omitted to point out to you that, when we are placed in the same circumstances as the Midland, we give Gloucester, as far as we can, the advantage of competition as against the South Wales ports in the direction of Swansea. And I think if you will compare the rates which we charge along the South Wales line, they will not appear unfavourable as compared with those charged by the Midland Company. Mr. Nicks' (I am afraid I must say), knowing that this comparison could be made, tells you that they do not do much trade towards South Wales. The quantity of traffic sent during last year in that direction was between 12,000 and 13,000 tons. In the other direction, that is, towards Swindon, there is no doubt that we do charge a higher scale of rates than we do charge towards South Wales, and we do it for this simple reason, that the consumption in that district is not very large. Gloucester has to compete with Bristol, and we put them on precisely the same scale. And further they compete with the timber and grain from London; and we charge from London as nearly as possible, in fact, upon the same scale. If the consumption was as large in the direction of Swindon as it is in South Staffordshire, or if the competition (I am bound to say) was as great as it would be by river, we would reduce our rates, if we could afford to do so.

11,782. (*Capt. Galton.*) To South Wales there is competition by sea—a coast competition, is there not?—Yes, there is; but there is more than that; Newport, Cardiff, and Swansea are importing towns, and of course Gloucester would obtain no share of that traffic if we or the water carriers charged high rates; they would be supplied from those places, so that Gloucester and we go hand in hand to get a share of that traffic.

11,783. (*Mr. Hamilton.*) In one of those tables

J. Grierson, Esq

25 Feb. 1866.

which you have had handed in, in which the charges by the two railways are given, I see that to Church Stretton, which is a distance of 69 miles, your timber rate is 10*s.*, against Tamworth, which is 70 miles distant, and to which the rate is 6*s.* 2*d.*, on the Midland, and you give a note both to Church Stretton and to Shrewsbury to say that the rates on the Shrewsbury and Hereford line include transfer from broad to narrow gauge. Can you give the Commission any information as to the cost of that transfer?—We generally put it at about 1*s.* a ton, but I do not know whether the Commission would wish me to give any explanation of this Tamworth low rate.

11,784. If you have any explanation to give we should be very glad to hear it?—It is simply this, that there there is competition again.

11,785. (*Mr. Horsfall.*) Therefore showing the advantage to the public of competition?—There is no doubt that competition to a certain extent is an advantage to the public; but if it is carried too far, I think I could show that it is very injurious to the public. Then, in answer to question 8995, Mr. Nicks stated that in consequence of the low rates given from Newport and the high rates from Gloucester, the trade of Gloucester has been diverted to Newport for the Hereford and Shrewsbury district. I may say that the very contrary is the case. This table, which I will hand in, shows a comparison of the rates from Newport and Gloucester and I think the Commissioners will be satisfied that it is not at all unfavourable to Gloucester, especially when I tell you that the result is this, that from Gloucester, in the year 1865, we carried into that agricultural district 3,062 tons, and from Newport the total tonnage was 502 tons. The fact is, that the trade of that district is very small. I will hand in the following table:—

COMPARISON of RATES for GRAIN and TIMBER and DISTANCES from GLOUCESTER and NEWPORT.

I may now refer to question 8998, and bearing on the whole of the evidence which has been laid before you on behalf of Gloucester, I should wish to read a question and the answer of Mr. Nicks, given in the Committee of the House of Commons last session on the London, Bucks, and East Gloucestershire Bill. There, of course, he is making complaints against the Great Western Railway Company, but not quite of the same character as he has brought before the Commissioners. He is asked this question: "And those rates "are given you by the Great Western Company?— "A. Yes, they are given us by the Great Western "Company. We do a great trade up the Great "Western Railway. I do not complain of their timber "rates half as much as I do of their passenger rates.—Q. "As a trader, then, you would not complain?—A. Not "as a general principle. I have every reason to be "satisfied with the Great Western goods rates. I do "not find fault with them as a general principle."

11,786. (*Mr. Glyn.*) Is that scheme before Parliament again this year?—Yes, it is before Parliament again this year. It is, in fact, a line which he has put before you as a thing which is desirable in the interest of the public and of Gloucester. Then he suggests a uniform mileage rate. I can only say that Mr. Nicks himself is a gentleman who has been very desirous of having a special rate, and he has a special rate at this moment from Gloucester to Reading; and in this very evidence that I have read he says, that in consequence of the favourable special rate which we give him to Reading he does a large trade with Reading, which he would not otherwise do.

11,787. (*Mr. Gower.*) What reduction has he?—He has no special reduction for himself, it is a reduction for Gloucester. It is not given to Mr. Nicks only. It was given to the trade of Gloucester upon his application. I do not know whether there is any question which the Commission would wish me to answer with respect to all the new lines in the district, and with regard to the alleged opposition on the part of the Great Western Company to any accommodation being given by new railways. If the Commission wish it, I should be quite prepared to do so.

11,788. (*Chairman.*) I presume the Great Western Company, like other companies, would object to a competing line being introduced into their district if they could prevent it?—No doubt, as a principle, we should. In this instance, however, we say that there is no necessity whatever for this competing line. It is a competing line which he desires between London and Oxford, he having already obtained the East Gloucestershire Railway from near Oxford to Gloucester.

11,789. (*Mr. Dalglish.*) Will you turn to question 8989, where Mr. Nicks is asked by the Chairman— "Does not your complaint resolve itself simply into "this, that, having no competition throughout the dis- "trict in which Gloucester is situated, you are charged "higher rates, and have not the same accommodation "as is given upon other parts of the Great Western "line?" to which he replies, "That is so." What ex-

planation have you to give upon that point?—I say there is no foundation for the statement, with the exception of the explanation which I have given, so far as it goes, as to the difference of the fares between London and Gloucester and London and Birmingham.

11,790. (*Earl of Belmore.*) Is the East Gloucestershire line opened?—No; they have not commenced to construct it.

11,791. (*Chairman.*) You stated that Mr. Nicks had always shown peculiar hostility to the Great Western Company; has he shown it more than any of the other inhabitants of Gloucester?—I do not wish to put it that he has shown peculiar hostility; I would rather put it in this way, that he is an active public man, and he has taken one side (I do not wish to put it more strongly than that), that side, unfortunately, being always antagonistic to the Great Western Company.

11,792. He appeared here, as you are aware, at the request of the Chamber of Commerce of Gloucester?—Quite so.

11,793. (*Mr. Horsfall.*) His hostility, I apprehend, is shown really in supporting opposing lines?—Yes; personally we get on exceedingly well with Mr. Nicks; he is a partizan, as I say, and of course the side he takes biases his views. I have not a word to say against Mr. Nicks personally.

11,794. (*Chairman.*) We will now go to Messrs. Howards' statement in the Appendix; what remarks have you to offer upon that statement?—With regard to Messrs. Howards' statement, I do not know that I can add anything more to the statement which I have already put before the Commission. I have looked carefully at the correspondence between our people and Messrs. Howard, and it appears to me that what they desire is a special rate for their own particular advantage; while we have to consider other customers. We are quite prepared to give Messrs. Howard fair rates for their implements in connexion with the London and North-western Company and the Midland Company to every place upon our line, but we certainly do object to give them such special rates as would injuriously affect other manufacturers who are situated upon our railway, or upon other railways with whom we have through booking.

11,795. (*Capt. Galton.*) Messrs. Howards' objections were not solely to the question of rates for goods; they also complained, I think, that although the Bedford and Cambridge Railway has been opened for three years, yet to this day passengers cannot book through from Bedford to Bristol or to any Great Western station west of Didcot, nor can a third-class passenger travel through without stopping the night at Oxford?—With regard to the first part of the complaint, it is quite correct that there is not through booking yet, but the two companies decidedly intend to establish through booking between all principal places; but it is a work of considerable labour, and that is the only reason why it has not already been carried out.

11,796. (*Mr. Glyn.*) It will fall into your general arrangements, will it not, in due time?—Yes; as a matter of course we take the largest questions and the most pressing first. With regard to the other part of his complaint, I can assure the Commission that that is an extremely difficult question; that a third-class passenger has to sleep a night at Oxford if he wants to go third class from Bedford to Bristol, is a complaint which would not only apply to Oxford but to many junctions between railway companies. It is, as I say, an exceedingly difficult question.

11,797. (*Capt. Galton.*) Is that owing to the very small number of trains to which third-class carriages are attached?—No doubt that is one reason, and also of course there is the difficulty in fixing the times of the trains of two companies to meet at junctions, even where you are so disposed. Take the case of our own line, which has a very large number of branches; we find it a most difficult thing to arrange. Of course if we were to carry third-class passengers by every train the difficulty would be got over to a great extent, but certainly that would be going a long way.

11,798. (*Mr. Glyn.*) It would be a very small traffic from Bedford through Oxford to Bristol, would it not?—Very small indeed.

11,799. (*Earl of Belmore.*) There are three changes of carriage, are there not, one at Bletchley, one at Oxford, and one at Didcot?—Quite so.

11,800. (*Mr. Hamilton.*) Have you no return to show the number of passengers between those points in 12 months?—We have not, because we do not book through, but we can pretty well tell where the most important points are at which to begin the through booking first.

11,801. With regard to those places to which those complaints allude, between Bedford and Bristol, do you suppose that it is a very small passenger traffic?—I should say that it is very small. Of course, taking the district west of Bristol in addition, it would be larger than the traffic to Bristol itself.

11,802. Have you any means of saying what the number of passengers might be per week?—I should be sorry to venture upon a figure, because it might be 20 passengers a week, or it might be 10.

11,803. Do not you think it would be more than 10?—No.

11,804. (*Earl of Belmore.*) In fact the majority of such passengers would go through London?—Yes, a great many would do so, no doubt, but the London and North-western Company have been putting on a good service of trains towards Cambridge, and they advertise the communication to show passengers how they may come from the east of England viâ that route to the west of England, but they have not yet commenced through booking.

11,805. (*Mr. Glyn.*) That will eventually open up the route to Norwich and the east all through?—Yes, no doubt through by Cambridge.

11,806. And no doubt through booking will be carried out before long?—It will be carried out before long between all the principal places.

11,807. (*Capt Galton.*) Another complaint is that, "previous to the amalgamation of the West Midland "with the Great Western Railway, passengers could be "conveyed through to Worcester from Bletchley with-"out change, but this has now been discontinued;" is that the fact?—That is so. Before the amalgamation between the Great Western and the West Midland companies the London and North-western and the West Midland companies worked together, and passengers could go through from Bletchley to Worcester. Since the West Midland line has become amalgamated with the Great Western, through trains run from Paddington through Oxford to Worcester, and the London and North-western Company can if they like put on a carriage, which we would take on at the Yarnton Junction, precisely the same as was done before.

11,808. The traffic is not sufficient to make that worth while, I presume?—I would not attempt to give a reason why they have not done so, but we are bound to take on a carriage for them if they think it is worth while to send it. I think it is more than probable that they consider that the bulk of the traffic would go by Oxford, and therefore it would not at present pay to run a through carriage. The public certainly so far as London is concerned do not suffer; but so far as any intermediate passengers are concerned between Bletchley and Oxford, no doubt they have to change.

11,809. (*Mr. Horsfall.*) Is this statement by Messrs. Howard in the Appendix correct, that the rates to Great Western stations and North-eastern stations north of Darlington are higher in proportion than those of the other great companies in the kingdom?—Of course I am not aware of what the rates are which are charged by other companies; but I have brought with me a scale of our own rates, which I do not think are at all unfair. I think it is quite possible that Messrs. Howard, being very large manufacturers, may get for their implements sent in large quantities from Bedford at a special rate lower than our scale is, but I certainly would not be disposed to recommend that they should have a lower rate unless we were reducing the rates to others.

J. Grierson, Esq.

15 Feb. 1866.

11,810. (*Chairman.*) What explanation have you to offer with regard to Mr. Williams' complaints ?—With regard to Mr. Walter Williams' complaints I will put in a table ; but I will just simply make this general remark with regard to his statement. He has shown the Commission the charges per ton per mile, but he has omitted to deduct the terminal charges in any case, or to show whether the rates included collection and delivery, and therefore he has not made the necessary deduction before he could make a fair comparison of the charges. I do not know whether it will be necessary to go into the details of the rates. I have gone very carefully into them, and I must say that so far from his having any grounds of complaint I consider that the special rates which we have given for South Staffordshire are very favourable indeed to that district. The rate from South Staffordshire to London has been reduced within the last few months. The rate was considered too high, and upon the application of the ironmasters themselves it was reduced by the two companies.

CORRECTED STATEMENT of RATES and DISTANCES handed in by Mr. W. WILLIAMS, of the South Staffordshire Ironmasters' Association.

To accompany Mr. Grierson's Evidence. Question 10,121.

11,811. (*Mr. Hamilton.*) To what extent was it reduced ?—It was reduced from 17*s.* 6*d.* to 15*s.* That rate includes collection and delivery, that is to say, delivery in London and collection in South Staffordshire.

11,812. (*Capt. Galton.*) Their complaint was that the rate originally charged would not enable them to compete with the Middlesbro' iron in the London market ?—Of course that is what they stated put them in an unfair position. But inasmuch as the Middlesbro' iron rate is, if I remember rightly, 16*s.* 8*d.* for rails and 18*s.* 4*d.* a ton for bars, we thought that that was scarcely a sufficient reason of itself. The grounds upon which we reduced it were these, that the cost of production was stated to us to be very much less at Middlesbro', and therefore we did not take into consideration only the cost of conveyance from Middlesbro', but we took the cost of production also into account.

11,813. (*Mr. Gower.*) Was there any anticipation of a line being proposed by the ironmasters ?—No ; but I must give this explanation, that at a meeting when the chairman of the London and North-western Company, and some of the directors and officers of that and the Great Western Company, met the ironmasters in the autumn, we pointed out to them that if they intended to hold the threat over our heads that if we did not reduce the rates they would support a new line, that we declined to discuss the question with them upon that footing. Mr. Hartley and Mr. Foster, M.P. for Staffordshire, and other gentlemen, stated that they had no such desire whatever, that they wished to meet us as they had met us before to discuss the question upon its merits, and upon that understanding and with that spirit we agreed to go into the question.

11,814. (*Mr. Horsfall.*) I see in this table furnished by Mr. Williams that the charge for 107 miles to Sheffield on pig iron, is 7*s.* 8*d.* ; to Liverpool, 84 miles, 9*s.* ; and to Manchester, 71 miles, also 9*s.*, can you explain that ?—I should have mentioned, probably, this, that we do not convey to Sheffield, and therefore I cannot explain it, but I may tell you what I have been informed, having asked for information, that the rate to Sheffield is only a station to station rate, whereas the rate to Liverpool and Manchester includes collection and delivery, and in Liverpool alongside the ship in 10-ton loads. Therefore the comparison is not a fair one.

11,815. If you look at the next scale you will find that Sheffield, Liverpool, and Manchester, though varying in mileage, are all charged the same, 10*s.* on bar iron ?—I cannot explain the Sheffield rate, as I have already mentioned, but that is the explanation given me with regard to it. I can say this, from my own knowledge, that the Liverpool rates do include collection in South Staffordshire and delivery alongside the ship.

11,816. Can you account for the difference in the scale of charge as between pig iron and bar iron, that in the one instance there is a considerable difference between the Sheffield and the Liverpool and Manchester rates, and in the other they are all charged the same, 10*s.* ?—Of course I could not give you an answer which would be of any value, as I do not know the circumstances, but I could give you my own impression as to what the reasons of that would be, namely, that in Sheffield they would desire to have pig iron for the purpose of manufacture, and that the company would give the South Staffordshire ironmasters a low rate to export it there in competition with the north of England pig iron ; that is the only reason that I can give, but that is only an opinion.

11,817. (*Mr. Gower.*) Do you anticipate any loss to your company from this reduction which you have just referred to ?—We certainly do hope that there will be an increase of traffic ; but whether it should be so or not,

I believe that, under the circumstances, we would have made the reduction, because there is no doubt that South Staffordshire does labour under disadvantages; labour is high there, and coal is much scarcer and is expensive, and in the competition with South Wales and Middlesborough there is no doubt the South Staffordshire ironmasters are at a disadvantage. Speaking for the Great Western Company, we having purchased or constructed lines in that district which have cost between 5,000,000*l.* and 6,000,000*l.*, and of course have a very great stake in the district (and the London and North-western company are in the same position to a very large extent, probably to as large or larger extent than we are), we have probably more interest in the district than the traders themselves, and we certainly desire to meet them in that spirit when we discuss rates and charges with them.

11,818. (*Mr. Glyn.*) You stated that in making the alteration you did take into consideration the commercial question as well as the railway question?—Yes, we do do that, and that seems to have been rather overlooked by some of those witnesses who have come before the Commission.

11,819. (*Chairman.*) Is the reduction solely in the rate to London?—It is solely in the rate to London; I think that was the only rate asked to be reduced.

11,820. (*Mr. Glyn.*) That was the complaint, was it not?—Yes, that was the complaint. I have a copy of the notice which I issued, which I could hand in, if the Commission wish it.

11,821. (*Mr. Roebuck.*) I do not suppose that your company is influenced by mere pure principles of philanthropy in your alterations of rates; why do you favour South Staffordshire in that way?—We are not actuated entirely in the way that the honourable member suggests, of course; we have reduced the rates there because if they were too high and stopped the production of iron it would injure the district, and therefore injure our companies.

11,822. That is to say you would have less to carry?—No doubt.

11,823. Therefore you lower your fares in hopes of getting a greater amount of business?—Yes; or in the case of South Staffordshire really to maintain what we have got, because the competition is becoming greater between that district and Middlesborough.

11,824. So that in benefiting South Staffordshire you look to benefit yourselves?—Certainly we hope to do so.

11,825. (*Mr. Horsfall.*) There is a still more glaring instance of inconsistency, namely, as between Swansea and Liverpool. Swansea is 170 miles, and your charge is 9*s.* 2*d.* on pig-iron, whereas Liverpool is only 84 miles and your charge is 9*s.*?—Yes; that is one of the discrepancies which is not explained in Mr. Williams' statement. The rate to Swansea is a station-to-station rate, the other is a collected and delivered rate.* In any case there is no doubt that the rate to Swansea is a low rate per ton per mile.

11,826. (*Capt. Galton.*) You should add to the Swansea rate the price of the terminal charges, should you not?—Yes; the collection and the delivery.†

11,827. (*Mr. Horsfall.*) Do you add the terminal charges at Liverpool, or not?—Yes, I have included them in the 9*s.*

11,828. Are they not included at Swansea?—No. There is no doubt, as I have said, that the Swansea rate is a low rate per ton per mile.

11,829. And the Liverpool rate is a high rate?—Of course the Liverpool rate is higher per mile, but we do not consider it a high rate, and if I show you what we have to deduct as the actual cost of the collection and delivery and the station charges, I think you will admit that the Liverpool rate is a very bare rate. I have often said that it is almost approaching a doubt whether it leaves much profit.

11,830. If the Liverpool rate is a bare rate the Swansea rate must be a still more bare rate?—What we get in the Swansea rate all goes into our pocket (except the collection) in reality, but in the case of the Liverpool rate we have to pay charges for delivery. In some cases our charges for the collection for South Staffordshire amount to 1*s.* 6*d.* to 2*s.* per ton.

11,831. (*Capt. Galton.*) Are your charges for delivery the same in Liverpool?—No; our charges for lighterage from Birkenhead to Liverpool vary from 1*s.* 3*d.* to 1*s.* 8*d.* per ton.

11,832. And that has to be deducted from the rate?—Yes, that has to be deducted from the rate.

11,833. That as well as the 2*s.* for collection in South Staffordshire?—Yes, I gave the maximum when I said 2*s.*; in some cases it is as low as 1*s.* 3*d.*, but I think in no case is it as low as 1*s.*

11,834. (*Mr. Horsfall.*) Why should the charge for collection from Wolverhampton be higher on iron sent to Liverpool than it is on iron sent to Swansea?—I am afraid that I have not made myself clear. If we carry iron to Swansea we make an addition to the charge which you see printed here. The fact is, as the honourable Commissioner says, the rate in the case of Swansea does not include delivery; therefore, if you ask us to collect in South Staffordshire any iron going to Swansea, and do the same service, we ask you for payment in addition to the rate which you see on this table.

11,835. Then you do not collect in South Staffordshire for iron going to Swansea?—Yes, we do collect.

11,836. (*Capt. Galton.*) With regard to your former answer as to the necessity of supporting South Staffordshire, did not you last summer give very low rates for the conveyance of coal into South Staffordshire, in order to support it during the strike of the colliers?—Yes; at the time of the strike in the colliery district we communicated with the ironmasters even before they communicated with us; in fact, I believe both companies did so almost simultaneously, and certainly they did it without any consultation. We offered to bring up coal from North Wales and also from South Wales at almost nominal rates into South Staffordshire, with a view to assist them during their difficulties, and we did bring in very large quantities of coal at very low rates from those districts.

11,837. (*Mr. Gower.*) To what do you attribute the low rate at Swansea?—The low rate to Swansea was given under these circumstances: the rate to Gloucester for iron is very low by river, and thence from Gloucester to Swansea iron can go by coaster very cheaply, and the rate was fixed taking that into consideration; and besides, it is to compete with the iron locally manufactured. It certainly is a very low rate, and really I have had frequently under consideration (not in consequence of its being brought forward here) that that rate should be raised, only it is such a very difficult thing to raise a rate after it has been quoted, that we have never touched it.

11,838. (*Capt. Galton.*) The fact is, that the iron of that district can pass by canal to the Severn, and then the navigation is perfectly free?—Yes, from Worcester down to Gloucester, a distance of between 30 and 40 miles, they can pass for a toll of 6*d.*, so that it is a very special case.

11,839. (*Chairman.*) Could you raise the rate to Swansea without losing the traffic?—That is doubtful; but it is a very bare rate.

11,840. What circumstances led you to include the expenses of collection and delivery in the charge to Liverpool and not in that to Swansea?—Because the great bulk of the iron which goes from South Staffordshire to Liverpool is for shipment, and the public like to have one charge. I believe the ironmasters, as between themselves and the merchants, in Liverpool, have from a very old established practice always delivered their iron in Liverpool at 10*s.* per ton above the Staffordshire price, whatever the rate was. I remember that the rate from South Staffordshire for iron during a period of competition was 6*s.* 6*d.* per ton, but still the ironmasters at that time were understood to have

* The witness afterwards corrected this part of the answer as follows:—"The rate to Swansea is a collected rate only."

† Afterwards corrected by witness to "Yes, the delivery."

J. Grierson, Esq.

15 Feb. 1866.

charged 10*s.* per ton more if it was delivered in Liverpool; they like to get a gross charge, and not to have two or three payments to make.

11,841. Purchasers in Swansea do not think it of so much importance?—There is no shipment of iron from Swansea as there is from Liverpool. The trade of Swansea is quite different, it is more for local consumption; of course, to some extent it is against the competition of local iron manufactured in the Aberdare district, and the low rate really is an advantage to the South Staffordshire people.

11,842. (*Mr. Dalglish.*) I see that in the statement from the South Staffordshire ironmasters, they suggest that it should be more clearly defined what the word "terminal" means as it is used in the Railway Acts. Can you give us a definition of the word "terminal?"—I will endeavour in some general observations at the end of my evidence to explain that, but I may state that it would be an exceedingly difficult thing to comply with the wish expressed by Mr. Williams that there should be a uniform and fixed sum chargeable for terminal services under the circumstances referred to in his suggestion number 2, which is where traffic is put in and out of a siding, because of the difference in the expense that that service and accommodation involves to the company. The charge which it would be fair for them to make depends upon a variety of circumstances. First, you may take a colliery district, where there is a siding on to which we may get a full train-load, and we may go direct away with it, but in another case it may be that it is an iron siding, into an iron-works only giving out two or three truck loads a day, and in such a case we may have to send a special engine for it from our station, and have all the cost of forming our train in the station.

11,843. (*Mr. Horsfall.*) In that case you make a special charge for a special engine, do you not?—We have never done so in that way.

In answer to questions 10,121 and 10,311, there is the hypothesis which Mr. Williams puts forward, that companies admit that a farthing per ton per mile is a fair and profitable charge. I only wish to say that I know of no such statement. I know of no company carrying at such a rate. Mr. Williams also refers to the notices which should be given as to the alteration of rates. In the case of the alteration which I have just referred to, namely, the London rate, and all the great alterations which have been made, all companies in fact, canal companies and railway companies, issue a printed notice to every person in the trade, so that what he desires is really carried out, except in cases of minor alterations, when it is not necessary to do so.

11,844. (*Mr. Glyn.*) Speaking generally, you give a month's notice, do you not?—We always give a month's notice but as the alterations are generally reductions in rates, a month's notice is scarcely necessary, but certainly in all those alterations we have given them a month's notice.

Then, in questions 10,167 and 10,172, in comparing the charges to Cardiff and other ports, Mr. Williams has omitted to take into consideration the collection and delivery in the same way as I have referred to before. In 10,182, and a number of other questions which you will find there, and also in the case of Mr. Gibbs, in 10,804 and 10,809, they make the statement that the railway companies are in the habit of making the same charge to the public, whether the service of cartage is performed or not. That is an entire mistake, and I am quite certain that they would correct it themselves if they had an opportunity of doing so. We always make a rebate where the public do the cartage itself; in fact, as far as I know, every company does.

11,845. (*Mr. Horsfall.*) Do you give the public the opportunity of doing the cartage themselves?—Yes, we do. The law requires us to do so. I may say that in the case of the Great Western Company, as near as I can ascertain, the public or carriers brought into and received from the Paddington station during the last year, about 160,000 tons of traffic, on which they either made the charge themselves for the cartage, or we made them an allowance out of the rate for the cartage. But I should make this explanation, that it is very much more convenient that the companies should do the cartage themselves, because if every individual brought his own cart into the station, or if a very large number of carriers were to come with their vans, the work of the station would be very much increased in cost, and the goods could not be delivered with anything like the facility with which it is done where the company do the carting themselves.

11,846. What rate per ton do you charge for cartage?—The rates vary from 1*s.* 6*d.* to 2*s.* 6*d.* in the country, and from about 2*s.* 6*d.* to practically 6*s.* or 7*s.* in London. I do not remember exactly what the maximum is in London.

Then in questions 10,247 and 10,382 Mr. Williams appears to desire what he calls competition between companies. Such competition as I presume he desires, namely, a competition of rates, as I stated before, I consider to be quite impossible. In fact I may mention this, that the very ironmasters themselves, who have been represented before the Commission, and also the salt manufacturers, have their regular meetings, at which they fix the prices of their own goods; and numerous bodies, not having a large capital at stake, like railway companies, which cannot be withdrawn from their concern, meet and make arrangements for their mutual protection. And as I said before, I consider that it would be utterly impossible that anything like a competition of rates should exist for any length of time.

Mr. Williams considers that the special circumstances of South Staffordshire should be taken into account. With respect to that, I say this, that we do take them into account. We carry limestone from North Wales, and other railway companies carry it from Froghall in North Staffordshire. We carry iron ore very cheaply, and the London and North-western Company carry the Northamptonshire iron into South Staffordshire at very low rates with a view of assisting the parties who smelt iron. And with regard to Mr. Walter Williams' complaint, Lord Ward, who has also large iron manufactories, and who has lime rocks in South Staffordshire, might complain of our bringing that limestone. The parties who roll the iron in South Staffordshire are also very anxious to get pig iron in to mix or to roll; we bring in pig iron from North Wales, from Westbury, and from South Wales; and, as has been referred to before, it is brought in from Middlesborough at very low rates to meet their requirements. Against that the parties who smelt the ore complain of the preference, and say that it is an unfair proceeding; but I say that railway companies do take into consideration the circumstances of a district, and although we cannot satisfy them all, I believe we do the best for them on the whole. With regard to questions 10,131, 10,320, and 10,321, I say that the rule which Mr. Williams proposes should be laid down is practically the principle upon which railway companies act.

11,847. (*Chairman.*) That is to say with respect to collection and delivery?—Yes.

11,848. (*Capt. Galton.*) And with respect to giving every one of the freighters the same advantage?—Yes.

11,849. I suppose it would be possible for a railway company, if it chose, to give a preference to one trader over another?—No doubt that might be done. That is, you mean to say, if a railway company chose to do so, they might give a lower rate—no doubt they might; but I say that, as a rule, such a thing is not done upon railways, except, of course, in special circumstances, (which I shall be very happy to explain,) in which I consider that both the interests of the public and of the railway company are served by an exception being made.

11,850. (*Mr. Glyn.*) On the occasion of large quantities being sent?—Yes; that is one of the conditions.

11,851. (*Mr. Hamilton.*) When you make those special rates, is there any mystery about them?—None whatever. Of course we do not publish them; but we never make it a mystery.

11,852. (*Mr. Glyn.*) You would do it to any other person under similar circumstances?—Certainly. What I wish to convey is, that no firm whatever gets a special rate for their special advantage.

In answer to questions 10,322 and 10,249, Mr. Williams advocates uniform rates. That is a point which I will refer to afterwards. I would simply say, that the question put in 10,252 is really the principle upon which rates are made, and I consider that they ought to be made in the interest of the public, and, in fact, of the ironmasters themselves. Then with regard to 10,390 and 10,398, I would simply say this, that iron taken from South Staffordshire in the evening is, as a rule, delivered in Liverpool and in London the next morning. An occasional delay may arise; but it is quite exceptional, I have no doubt, by whatever route it is conveyed.

11,853. (*Capt. Galton.*) Are goods that are sent to the railway one day delivered the next day in London or Liverpool, as a rule?—Yes. In fact, I think, if you look at the two answers which Mr. Williams has given to those two questions, you will find that in the one case he states that there is no delay, as a rule, and in the other case he states that they have to complain of the delay. I do not know that I need say anything further upon his evidence.

11,854. (*Chairman.*) Now, will you go to Mr. Mathews' evidence. Are his complaints mainly of the same character as Mr. Williams'?—They are practically the same. He complains of the Middlesbro' rates, and he gives a table of rates also, omitting to make the deductions in the same way as Mr. Williams does; and he also complains that in consequence of our rates he is unable to roll armour plates either in North Staffordshire or in South Staffordshire to send to London. As far as we can find there are no armour plates rolled in this district; but there is a trade in armour plates from Shropshire, where the rates are really higher to London than they are from either the North or the South Staffordshire districts.

[*The witness handed in the following tables.*]

Shropshire - -	Birmingham - -	„ - -	27	6 8	1·63	Delivered.

In making the calculations as to what the rates yield, the following deductions for collection, delivery, and terminals, have been made from the rates:—

		s.	d.	
Undamageable iron -	S. to S. -	1	6	- Terminals at each end.
Pig „ -	„ -	0	9	„ „
Undamageable „ -	Collected -	1	0	- In addition.
„ „ -	Delivered -	3	4	- „
Pig iron to Birmingham	„ -	1	6	- „

11,855. (*Earl of Belmore.*) When Mr. Mathews prepared this table had he any opportunity of knowing that some of your quotations included collection and delivery, and some did not?—He would have an opportunity if he were to ask. If Mr. Mathews were to write me a letter and ask me what the rates were, I should send them to him.

11,856. He would not know it in any other way from any published document or table of rates, would he?—He can know it from his own accounts if he sends traffic, if that is what the noble Lord means. If he examined his own accounts he would see what the service included.

11,857. I mean had he the means of knowing what was included in certain quotations, and what was not included in others?—He could have the means by simply asking; but I am afraid from the evidence of Mr. Williams that they have gone to station masters and asked questions, as if in reality there was any secret about our rates. I have not the slightest doubt that if he had sent to Euston Square or sent to Paddington he would have got a copy of the list at once.

11,858. Have you a list at Paddington which shows which rates do include collection and delivery, and which do not include collection and delivery?—Yes.

11,859. Which the public could have on application?—Certainly. I will put in some of the forms from which any person asking a rate, gets the information he wants, stating what it does include.

11,860. (*Mr. Dalglish.*) You stated, did you not, that as a rule different rates are not given to people in the same trade?—I did.

11,861. Have you any knowledge whether there is any different rate given to any of the directors on the Great Western line from that given to other traders on the line?—Most decidedly not.

11,862. Nor to any officials of the line who trade in coal or in any article carried on the line?—I am not aware of a single official upon the Great Western Railway whom you could call a trader in the strict sense of the word; there are several officers of the company who have shares in a limited liability company, called the Ruabon Coal Company and we have a published agreement with that company. With that exception I know of no officer of the company who has any interest in any trade upon the line. But with respect to the Ruabon coal matter (first of all, perhaps, I ought to say that I am not a shareholder or in any way directly or indirectly connected with any coal trade whatever), I was going to explain that with respect to that agreement it is a public agreement, and it has been my duty to watch the company's interests in carrying out that agreement, and I say most distinctly that they have had no advantage of the slightest description beyond what that agreement gives them. I should be very happy to explain the agreement if it is desired. I do not know whether the honourable member referred to that matter, but with regard to the general principle I can answer the question broadly in the way I have done. With regard to that special case it has been a subject which has been brought before Parliament frequently.

11,863. (*Mr. Hamilton.*) With whom does it rest to give a special rate, does it rest with yourself?—With myself, but of course it is done through the goods manager, because it would be utterly impossible for me to go into every special rate that is given, but I lay down the principles upon which the special rates are to be given, and they are brought to me in a list, and I have a general supervision over them. Of course all the meetings with the public, except on very special and large questions, are through the goods manager.

11,864. Then to a certain extent it does rest with them to carry out their instructions in good faith?—It does.

11,865. And that cannot be avoided?—It is impossible to avoid it. Of course any very large question, such as a general reduction of rates, or a general reduction of fares, is arranged after the whole subject has been discussed at the Board, but the details of carrying it out are left to the officers.

11,866. Has it ever come to your knowledge that a special rate showing personal preference has been given by the goods managers on the Great Western Railway?—Never. I never heard such a thing alleged, although we have, as a matter of course, to meet traders every year before committees, both when we are promoting bills, and when we are opposing bills, and except from merely a general statement that probably favouritism has been shown, I never heard anyone endeavour to make a specific charge of that sort. Then with regard to question 10,452, where Mr. Mathews shows that the rate for pig iron to Shropshire from South Staffordshire is very high per ton per mile, I think about 3*d.* He there again omits the terminal charges; and further, the porterage, &c.—we stack the iron and weigh it, and perform a number of services upon it, which ought to be taken into consideration. Then, with regard to 10,455 and 10,527, as far as I am aware all companies charge the same rates out of South Staffordshire as they do into South Staffordshire for the same places.

With regard to Mr. Thomas Perry, of Bilston, who represents the iron-founders, he proposes, I see, that all castings should be charged at the same rates as bar iron. I may state that we have for a number of years been very desirous to encourage that description of traffic out of South Staffordshire, in consequence of the competition which the iron-founders meet with from Middlesbro' and elsewhere, and we have given them special rates, in fact, for many years, but to carry out what Mr. Perry proposes would be a very great loss, and I think would be very unfair, because castings are sometimes very light, very bulky, very brittle, and also very valuable.

11,867. (*Capt. Galton.*) As far as brittleness is concerned, he proposes that the risk should be on the persons sending, does he not?—I suppose he would, in that case, but in some cases there are castings which we could not convey in one truck; we have brought up castings by special trains on Sunday, because it was unsafe to bring them in any other mode, and we have had to stop all the down trains as they passed.

11,868. Is that because they project so much over the line?—Yes; both very heavy castings which are, of course, cheaper per ton, at least cheaper because they are only of cast iron, and valuable castings, ought to be quite excepted from the general classification.

Then Mr. Walker of Wolverhampton makes a comparison of the rates from Wolverhampton with the rates from London. I say that there is no such traffic from London, and although there is a "class" in which the same goods are to be found, the rate is so worked out that really it is not a comparison at all.

11,869. (*Capt. Galton.*) What class of traffic is that?—It is hardware; what I refer to is in question 10,648.

11,870. Is there no traffic in hardware to London from South Staffordshire?—Mr. Walker takes the rate from Wolverhampton to London, where there really is a very large hardware trade. Then he takes the rate from London to another town, I think to Liverpool, and he says we charge a very much lower rate per mile for that hardware than is charged from Wolverhampton to London. I say there is no such traffic. I will put in a comparison of the list of rates charged. I may say generally as to hardware rates from Wolverhampton and South Staffordshire, that there is no inequality to complain of, such as that mentioned by Mr. Walker. What he really does object to, is not so much the rates that we charge to them, as what he considers the lower rates charged to other places, or, indeed, in many cases he complains that the rates to certain places from Wolverhampton are lower per mile than they are to certain other places; which is really giving Wolverhampton an advantage over some competitors that they have, and ought not to be brought as a charge against us, because it really is to assist them to carry on their trade.

11,871. (*Mr. Glyn.*) In point of fact those rates in most places have been established at the request of the people there, have they not?—Quite so.

11,872. (*Mr. Horsfall.*) Those reduced rates will, of course, be to the detriment, will they not, of the town to which you charge the higher rate?—You may put it in that way, but I think it would scarcely be fair. Take the case, say, from Wolverhampton to Reading. Whereas we charge 2*d.* per ton per mile from Wolverhampton to Reading, we charge 1½*d.* per ton per mile from Wolverhampton to London. I think that one would scarcely say that that is an unfair thing to Reading with a small trade compared with London, which has a very large trade, and where there may be competition.

11,873. We will not take a small place like Reading, but take Liverpool or Manchester; do you think that it is not to the detriment of Liverpool if you charge a higher rate for the traffic than you charge to London?—We do not.

11,874. I am merely putting the case of Liverpool hypothetically?—If you put any case where it appears that we do so, I shall be glad to answer it; but with respect to the specific case which you put, I say we do not do so. We charge a low rate comparatively to Liverpool, and I think you will find that even the Wolverhampton people complain that we do charge a comparatively lower rate to Liverpool than we do to London. But there I must tell you the parties again omit to take into consideration the expenses in London.

11,875. (*Mr. Gower.*) In the table put in by Mr. Mathews, I see that in some instances there is the same charge for pigs and bars, and in other instances there seems a very great difference in the amounts charged, how do you account for that discrepancy?—Without looking to specific cases, I may say this generally, that very frequently bar iron and pig iron are charged the same rate when the consumption is small; but take, for instance, a case where, as at Oxford, there is a small foundry, or rather, I should say, a very fair-sized foundry for such a city as Oxford. There the public desire to have a special rate for pig iron lower than the ordinary bar iron rate, and we give them a special rate; but if it was only a few tons of pig iron per annum that was consumed at Oxford, we should charge the same rate as for bar iron.

11,876. There was a statement made that the rates from Wolverhampton to Glasgow are the same both for pigs and bars, and likewise for Gloucester, how do you explain that?—The fact is that the rate from Wolverhampton to Glasgow is exceedingly low—it is only 20*s.* per ton for 288 miles. I am not acquainted with the iron trade from Wolverhampton to Glasgow, but I think that in all probability no such thing as pig iron goes, because of course near Glasgow a very large quantity of pig iron is produced.

11,877. (*Mr. Dalglish.*) A great deal goes from Glasgow to Wolverhampton, does it not?—That is more likely, I should think, and probably no bar iron would come from Glasgow to Wolverhampton.

11,878. Probably that is in consequence of the sea competition?—Yes, no doubt; besides, unless it is carried cheap, it would not be carried at all.

11,879. (*Chairman.*) Have you any explanation to offer with regard to the evidence at question 10,663, where Mr. Walker states that wire in some cases is carried from Warrington to London at lower rates than from Birmingham and Wolverhampton to London?—In that case I will also put in some figures, if you will allow me, showing that Mr. Walker's information is incorrect. He states that the rate for wire from Warrington to London, which is carried both by the London and North-western and the Great Western companies, is a certain figure, but it is not the figure he mentions, and besides it does not include the same services as it does from South Staffordshire. In fact in miling out the rate charged from Warrington, from Wolverhampton, and also from Shropshire, the Warrington rate is a trifle higher per mile than the one of which he complains.

The following table was delivered in:—

RATES for the CARRIAGE of WIRE IRON.

Mr. Walker's Evidence.

From.	To.	Distance.	Rate.			Yields, after Deduction of Collection and Delivery and Terminals.
			Per Ton.			
			s.	*d.*		
Warrington - -	London - -	182	17	6	Delivered in London by barge only.	$\frac{53}{100}$ on 11*s.* 2*d.* per ton.
Wolverhampton -	„ - -	125	15	0	Collected and delivered - -	$\frac{51}{100}$ „ 5*s.* 6*d.* „
Oakengates - -	„ - -	153	17	6	Carted in London - -	$\frac{74}{100}$ „ 9*s.* 6*d.* „

J. Grierson, Esq.

15 Feb. 1866.

11,880. Will you now go to Mr. Gibbs' statement, and give any explanations you think necessary?—Mr. Gibbs' evidence, like that of the other gentlemen, is based upon rates per mile before the deduction of the cartage and the terminal services, so that in fact his figures are nearly all wrong.

11,881. Have you a statement of your own to produce with regard to that?—Yes; I have prepared a corrected statement of the rates and distances in reply to those handed in by Mr. Gibbs, which I will deliver in.

RATES and DISTANCES handed in by MR. J. E. GIBBS, Wolverhampton Chamber of Commerce, *corrected*.

(*Question*, 10,748.)

Birmingham	,,	,,	112	—	—	111	29	27*s.* 6*d.*	1·89	,,

The corrected calculations are made after deductiug terminals 4*s.* at each end in the country, and 8*s.* 6*d.* in London.

I must make this explanation with regard to this statement, that Mr. Gibbs has miled the traffic out as showing what the charge is in his opinion per ton per mile. I have shown in another column whether it includes collection and delivery or not, and the rate per ton per mile after deducting terminals.

11,882. (*Mr. Glyn.*) Does not it rather show that it would be an advantage if the terminal charge were always put in a separate column in figures, and given so to the dealers, so that they might see exactly what was paid for mileage and what for terminal?—I may say that I have never heard such a thing asked for by them. Of course there are instances where we have had disputes, where the question has been raised, but so far we find this that if we give them a rate, and if it is satisfactory, one which enables them to carry on their business, they do not care how it is made out.

11,883. We have had complaints that the traders have a difficulty in dissecting the accounts that are sent in to them that they do not know what is the rate per mile and what is the terminal; is there any difficulty in giving it to them in a separate form?—There would be very great difficulty when we charge less than our parliamentary toll. If you charge your full maximum and your full terminal of course there is no difficulty.

11,884. If you charge less than your parliamentary toll you come to a regular mileage rate, do yo not; then you might put down the one as the regular mileage rate that you intend to charge, and the other as the terminal, distinct by itself?—You must either appear to maintain your full parliamentary rate per mile, or you must appear to maintain your full terminal.

11,885. (*Mr. Hamilton.*) Why not make a deduction of them both?—That would be the proper course, no doubt, if it would be any use.

11,886. (*Mr. Glyn.*) Supposing there were a fixed uniform terminal to all places in England, that is to say, supposing you consented to adopt some average terminal representing the terminal for the whole of England, in that case there would be no difficulty, would there, in fixing so much per mile, and so much for the terminal?—None, if you fix and charge the terminal; but then at present we are only at liberty to make a reasonable charge for terminal services, and that word "reasonable" is to govern the terminal charges in all cases.

11,887. (*Capt. Galton.*) Is it not the same practically in every case?—No.

11,888. (*Mr. Glyn.*) In point of fact are the Commissioners to understand from you that there is a certain amount of profit always taken in the calculation for the terminals, or is the cost to the company greater than the terminal?—In fixing a maximum terminal we should put in what might cover a small profit, but as a rule, our charges do not leave a profit, on the contrary the terminals are, as a rule, a loss.

11,889. You say that you could not possibly make out an account to show the terminals distinct from the mileage charge?—I do not mean to say that we could not do it if we were to charge the terminal universally in the way that has been suggested.

11,890. Take the instance of 5*s.* being the terminal charge for London, why should you not in making out your bills of charges for London to the trade, say, the charge for the rate upon the railway is so much, and 5*s.* is the terminal charge for London?—There would be no difficulty in doing it that way if you made that charge invariably; but take this case, that the parliamentary rate upon the railway would be 20*s.*, and the terminal charges 5*s.*, and we only charged gross 22*s.* 6*d.*, then the question is from what would you make the deduction, whether from the terminal or from the mileage, that is the difficulty.

11,891. (*Mr. Hamilton.*) Why should it not be from both?—We might do. I only mean to say that that would be giving the trader no real information, because we might give him this that the parliamentary charge is 20*s.*, and terminal 5*s.*, that is 25*s.*; but we reduce the gross charge by 2*s.* 6*d.*

11,892. (*Sir R. Hill.*) You can strike off the percentage from each, can you not?—That of course could

be done; but what I meant to convey was this, that you would be in doubt from which you would take the 2*s.* 6*d.*, whether from the terminal or from the mileage, that is all.

11,893. (*Chairman.*) In fixing the charge you do not take into consideration the component parts that make it up, you take it as a whole, do you not, that is to say, you consider what the gross charge is you can make?—That is exactly what we do, of course, when below what we are empowered to charge. I think I might say generally with regard to Mr. Gibbs' evidence that he has answered it himself. I have known the trade of that district for many years, and I am satisfied that the rates given from time to time for trade out of that district are very fair, and have been a very great advantage to the trade of the district, which is increasing; the hardware trade has increased considerably. I have carefully gone through the rates, and except, perhaps, in one or two instances where some slight alteration might be made just to prevent what appears to be an anomaly, I certainly do not see any reason for making any general alteration in the rates.

11,894. Mr. Brown's complaint, I think, chiefly refers to the detention of waggons belonging to private owners?—Yes, which I will refer to generally in a later part of my evidence. With regard to certain special cases, he gives three which I have been endeavouring to trace, but I am sorry to say that the time has been so limited that I have not been able to do so. I may mention this, that he states that he does not know when the waggons go away, where they are detained, or, if they break down, that they have broken down. We have a regulation on the Great Western line (and I will put in one of the documents), requiring every station master to advise the owner of a waggon whenever it breaks down, and telling him the injury to it, and the cause.

_____

11,895. Have you reason to suppose that the station masters in general attend to those directions?—I have. I do not doubt that occasionally they are omitted to be attended to over such a large system as ours, and it is quite possible it may turn out that in this case he may not have had notice given him, but that I cannot say as yet. Then in 11,113 he rather complains that we do not repair the waggons when damaged. On the Great Western system we were always in the habit of repairing all the traders' waggons in the same way that we repaired our own, but we got into so many difficulties, and had so many disputed accounts with the traders afterwards as to the cost of the repairs, that we were obliged to give it up. It would be an advantage to us to repair them, which we would do at the actual cost, if they would pay the accounts without disputing them, but after the work was done we found that we were unable to get payment, and we were obliged to say to them, you must repair them yourselves. Then Mr. Brown must have forgotten that upon the South Staffordshire line, as upon the other lines, there is a clause in the Act of Parliament which does enable us to charge terminals in addition to the maximum rate. He appears to have thought it was only in the case of tolls.

In Mr. Corbett's evidence, to which I would now wish to refer, Mr. Corbett mentioned to the Commissioners one rate which he had for salt from Stoke to London, but he overlooked entirely all the other rates that he has, and I think it would be desirable that they should be looked at, and I will hand in a table of salt rates to London and the South Coast.

GREAT WESTERN STATEMENT ON MR. CORBETT'S EVIDENCE.

List of Rates charged for the Carriage of Salt to London, &c.—Questions 10,873. 11,069.

Stoke to—	Distance.	Rate. O. W.	Rate. Yields less 9*d.* per ton Terminals at each end.

The correct rates from Winsford are as under :—

Winsford to Camden, 165 miles - -	-	10*s.* 6*d.* per ton., ·65 per ton per mile.
Do. Victoria Docks (for shipment)	-	8*s* do.
Do. Camden do.	-	7*s.* 6*d.* do.

In question 10,873 Mr. Corbett states that his rate for salt from Stoke to Camden is 9*s.* per ton, that is his rate for local salt, consumed in London; but he has a rate of 9*s.* 5*d.* to Poplar; he has a rate of 6*s.* to Brentford for shipment, of 7*s.* to Brentford for chemical purposes, and of 9*s.* 6*d.* to Brentford for local purposes; of 8*s.* 4*d.* to Paddington for local consumption. And again, to Poplar a rate of 6*s.* 6*d.* for shipment; to the Victoria Docks 7*s.* for shipment; and to the Bricklayers' Arms a rate of 8*s.* 4*d.* per ton. The rate which he has given to the Commission also as being the rate from Winsford to London, with which he has to compete, was an error; it is higher than what he states. On the whole, I think that he has very favourable rates indeed to London.

11,896. (*Mr. Hamilton.*) In fact, if he got what he asked for, namely, a uniform mileage rate, it would destroy his trade to a certain extent, would it not?—It would destroy his trade to a certain extent, or we should have to charge an exceedingly low rate to London for local consumption.

11,897. And that would destroy your profit?—Yes, that would destroy our profit.

11,898. (*Capt. Galton.*) One of his great complaints was the great detention of his salt?—Yes; I have endeavoured, in the time since I saw his evidence, to trace all his waggons running over the Great Western Railway for six months. Of course I have not been able to do that completely; but I have a statement in the other room with regard to such of them as we have been able to trace (which probably are not above one-quarter of the whole), and we find that there is very little detention in the running of his waggons.

11,899. Mr. Corbett complains, does he not, of the detention that occurs at stations like Reading and Oxford?—Yes; I must say this, that at Oxford, for local consumption, it is quite possible that sometimes there will be some delay, because the station there is very inconvenient at present, and is to be re-arranged altogether; but that is a very small part of the matter. The principal complaint that he makes is with regard to Gloucester, where the transfer to the broad gauge has to take place, which I will come to afterwards; and with regard to waggons going beyond Reading, I cannot answer for the detentions beyond Reading; but certainly on the Great Western Railway there is very little detention indeed. As a rule, we get the salt vans from him, as it were, this evening, and they are at Reading the next day.

11,900. Are they detained at Reading itself?—Yes, they are detained at Reading, and that is what he overlooked; he puts before you that 48 hours is quite sufficient time to allow for unloading. I grant that it is; but then his customers very often keep the waggons probably for a week before unloading them, and he makes no allowance whatever for that; in fact he seems to have no information at all about it. We, in common with other railway companies, have found that such an evil, I do not say with regard to salt trade only, but with regard to owners of waggons generally, that we are obliged to require them to pay a siding charge in order to compel them to unload within a reasonable time; at least we endeavour to do so. If he would take that into account, and would look up his customers, he would find that nearly the whole of the detention arises at the inward station. I must again say this, that some detentions I have no doubt will be found to have arisen from a want of sufficient accommodation at Droitwich and also at Worcester, where we are constucting a new station altogether, and to some extent, as I said before, at Oxford and also at Reading, but that is a very small portion of the whole delay. The customers take the advantage when they are not their own waggons, and unload them when it is convenient. In fact, at Reading our people have complained that they have had to take waggons which have been lying at the Reading station for several days for about half a mile down the line to put them into a siding out of the way.

11,901. Is the salt which Mr. Corbett sends to Reading all sold at Reading itself?—No. When the salt is going through to the South-eastern or the South-western lines, there is no delay, because the salt is handed over to them at the sidings, but it may be that delay again arises at the consignees' station upon those railways—that I cannot answer for; but in the case of Reading I say that the consignees do not unload their salt promptly. But the bulk of Mr. Corbett's complaints, as you see, are with regard to waggons going beyond Reading, although, by the bye, he shows this, that waggons going beyond Reading come back much more quickly than they do from Reading itself, so that that shows that the delay cannot be in the transit. Then, with regard to questions 10,900 and 10,903, we give Mr. Corbett through rates for salt whenever he desires them, and have no objection whatever to do so.

11,902. He admitted that he had very low rates to the south coast?—I do not know any person who has been more urgent for reduced rates than Mr. Corbett. In fact I think about three years ago he urged me very strongly to give him reduced rates for all the ports in the south of England, as against the Cheshire salt. I sent to the railway companies who have stations at those ports, and we obtained returns of all the salt that was imported, and I took it out myself from those ports where we have stations, and we found it such a small traffic that we declined to do it, and we sent him a list that silenced him for two years. About six months ago he recommenced the correspondence, and we again took out the information, and we found that the traffic amounted to several hundred tons. The low rate of freights from Runcorn to the southern ports having enabled the Cheshire salt to come in competition with the Worcester salt, and upon that we gave him a reduced scale of rates, which you will see in the table which I have handed in. That happened a few months ago.

11,903. (*Chairman.*) Was that subsequently to the time that he gave his evidence?—No, long prior to it.

11,904. (*Capt. Galton.*) Does this rate involve any change of gauge?—None of those rates do; they are all in narrow-gauge waggons going through to other lines.

11,905. Then you do not give a low rate to Plymouth, for instance?—We do not carry to Plymouth; from that district salt goes by the Bristol and Exeter line.

11,906. (*Mr. Hamilton.*) With regard to the detention of trucks, have you any returns made to you which would enable you to ascertain when the delay arises from causes within the control of the railway company and when from the omission of the consignees to take delivery?—We have had for a long time, upon what I may call the old Great Western line, nearly the same system of returns for private waggons that we have for our own, but upon this portion of the line to which Mr. Corbett's complaints are directed that system was not adopted till recently. Now we have information which would enable us to trace the trader's waggons nearly the same as our own.

11,907. So as to show what the delay arises from?—Quite so.

11,908. You do not admit his statement in answer to question 11,028 and the following questions that the delay does not arise from neglect on the part of the consignees to take delivery?—I do not admit that. Of course, as I said before, I am aware of the inconvenience at some of our stations, which I have no doubt in some cases has been a cause of delay, and that the company are endeavouring to remedy, but as a general rule I say that there is no such delay in the transit.

11,909. I see that at question 11,033 there is a question put by myself: "Has it ever happened that "railway companies have made complaints about the "delays of consignees in taking delivery of the goods?" —A. Not that I am aware of. Q. They never have "reached you?—A. Not to me; if it has been so they "have the remedy in their own hands, by charging "siding room to the consignees, and if they would "enforce that I think there is no proprietor of railway "waggons but would readily concur in it." What do you say in answer to that suggestion?—I say it is a very good suggestion indeed, and I only wish that the consignees would submit to it. I could give a very good instance of that. In the Chester station, which was a joint station for the Chester and Holyhead, the London and North-western, the Great Western, and the Birkenhead lines we are continually increasing the accommodation. There were probably 20 or 30 traders in the station, and we have expended a very large sum of money upon that station. After the station came into the possession of the London and North-western Company and the Great Western Company we objected to go on spending money, because we found that the traders were keeping the trucks for days ready to have coal to deliver to any party who might come, and we stated that we would not give them wharfage accommodation unless they unloaded their trucks within a reasonable time. The result was that in a very short time we had the place comparatively clear, but they have broken out again, and within the last few months there has been a demand for accommodation to the extent of 7,000*l.* or 8,000*l.*, which we consider entirely unnecessary if they would conduct their business in a proper manner. But they compete with one another to such an extent that they are very anxious always to have a stock ready on hand for any customer.

11,910. (*Capt. Galton.*) You mean in those coal sidings?—Yes.

11,911. Do they keep coal trains there for the purpose of loading ships which are not yet in dock?—No; I am referring to Chester, where it is merely for local consumption; they filled the sidings in such a way that we could not carry on our work. If the consignees themselves, or the proprietors of the waggons, would pay a certain limited sum to the railway company for siding room, which is really what Mr. Corbett suggests, the very best thing for them would be to enforce it.

11,912. (*Mr. Hamilton.*) Would not the natural course be that this charge against the consignees should be made by the consignor and not by the railway company; why should they not settle the matter between themselves?—For this reason, that although the consignor, who owns the waggons, certainly loses the rent of the waggons, the railway company are also losing the use of their siding accommodation, and as the railway company are on the spot there is no doubt that they have much more power to ascertain what the actual cause of detention is, and also to put in force the regulations as to siding rent.

11,913. The consignor and the railway company have a common interest, have they not?—Yes, they have, but there is this difficulty about it: supposing Mr. Corbett is competing with other salt works at Droitwich, and he is selling goods to a man at Reading, and we charge him, or he charges him, for the use of the waggons and the detention of them, he may say, I will buy no more salt from you, I will go to other people, who don't charge demurrage.

11,914. It is very natural that you should wish to make them pay for the use of your siding?—Yes; as far as that goes it is not unreasonable that we should, only the consignees will not pay.

11,915. (*Chairman.*) Have you no power of enforcing payment from the consignees, if you require them to pay?—It is doubtful; at the Chester station at this very moment we are in that difficulty, as I said before; they are again detaining their waggons there, blocking up the station, and refusing to pay the siding rent.

11,916. (*Mr. Glyn.*) What number of days would you think a fair allowance of time?—About 48 hours.

11,917. After that you would like to be able to make a certain wharfage charge, or station charge, whichever you choose to call it?—Yes; if I myself were the owner of private waggons I should desire it in my own interest.

11,918. As a railway manager you think that it would be a fair and proper charge, which you ought to make the public pay, with a view to keep your own station clear—Yes; and I should desire never to have to collect any money for it, because it is a most serious loss to the company to have their stations blocked up.

11,919. In fact the absence of such a power of charging involves the companies who own the stations in very great and constant inconvenience?—It does, and also by the detentions to other people's traffic by their not being able to get at their waggons to unload them when they desire to do it, they make other people suffer.

11,920. (*Capt. Galton.*) If you had the power of making that charge should you then concur in the further view that if the railway company detained waggons unnecessarily they should pay a demurrage?—We give the traders an allowance which covers all the cost to them of their waggons, and if their waggons are occasionally detained we certainly say that they ought not to come upon us for demurrage under the special circumstances of the case.

11,921. (*Mr. Hamilton.*) Then Mr. Corbett is hardly right in throwing upon you the responsibility of settling for these detentions with the consignees, because you say it is doubtful whether you have the power to do it or not?—It is so.

11,922. But you would not be unwilling to use the power if you thought it likely that you could obtain it?—We might, but if the power were given to us I have no doubt that the public and the consignees would think that it was for our benefit.

11,923. (*Mr. Glyn.*) Have you any doubt about the question of power; you have not the power, have you?—I am not prepared to say that, because I am of opinion that we have the power ourselves, but I have been advised by another party that we have not the power.

11,924. Have you not the power of legally enforcing the charge if you make it?—I consider myself that after giving notice we can enforce it, but of course I only express my own opinion, and I say that it is doubtful because I am advised by another party that we have not that power.

11,925. (*Mr. Hamilton.*) Do you think it desirable that that doubt should be cleared up?—I should say that it is most decidedly desirable, in the interest of the

J. Grierson, Esq.

15 Feb. 1866.

owners of the waggons themselves, and in the interest of the public.

11,926. (*Chairman.*) Does that refer only to waggons belonging to private parties?—Yes.

11,927. Can you compel the consignees to empty the waggons belonging to the railway company?—In the case of the company providing waggons we provide them under certain conditions, and then of course we can require them to sign a contract that they are willing to abide by those conditions.

11,928. (*Capt. Galton.*) One of those conditions being that they will pay demurrage for every day that they detain the waggons?—Yes. There again we desire to have no revenue from such a source as that for the detention of our waggons.

With regard to the complaint on the subject of warehousing at Birkenhead, in Appendix T., that is a very small matter indeed. The extent of warehouse accommodation, which is joint between the London and North-western Company and the Great Western Company at Birkenhead, is exceedingly small, consisting of two floors, probably 100 feet square each, whilst the lock warehouses are an enormous range of buildings, so that any sort of warehouse accommodation which is given to traffic in transit by the two companies cannot in the slightest degree affect the trade of the Mersey Dock and Harbour Board.

With regard to Mr. Wilson's evidence, and to the complaint which is made against the Great Western Company as the owners of the Kennett and Avon Canal, I believe I may state generally that a complaint was lodged before the Board of Trade last year that we put a lock on the gates at night, and did not allow boats to pass through at night. They also said that we gave a preference to some boats of our own, and further they complained that we used the Berks and Hants Railway, which is a railway running parallel to our own canal, in competition with the canal. We met the parties without going before the Board of Trade, and told them that we were perfectly prepared to go to the Board of Trade on the subject, but as to their grounds of complaint we should be very happy to rectify them as far as reasonable without having recourse to an appeal to the Board of Trade. I do not see myself that they have really any grounds of complaint whatever, except this, that on three occasions (I think) during a period of 12 months the canal manager had allowed our own boats to pass through during the night, and I had him to meet the parties, and I asked him whether under the special circumstances under which he said he had allowed these boats to pass, he would have allowed their boats to pass, and he said that most certainly in any case where it was urgent, or where they were desirous that the lock should be kept open for them it should be kept open for them in a special case. With regard to the rates, I told them that we could not go into the question of railway rates competing with the canal, the Great Western Company are the owners of the canal, whereas we are not the owners of the railway—we merely work it—so that I think the Commission will at once see that there cannot be very much ground of complaint against us upon the question of rates. However, they went before the Board of Trade, and since that they have abandoned the case there, and have issued a writ, and they are going to take us into court, but upon what grounds I have yet to see.

11,929. Have the Board of Trade any power in the matter?—No; the Kennett and Avon Canal Act gives no special powers to the Board of Trade.

11,930. I mean to remedy grievances, if they are proved?—I am not aware that they have the power to deal with this question, but they have special power to deal with certain complaints under the Transfer Act. I do not know whether they have full power, but we were quite willing to meet them fairly.

11,931. (*Mr. Horsfall.*) Have they agreed to abide by the decision of the Board of Trade?—Without our knowing the reason for it they appear to have abandoned their application to the Board of Trade.

11,932. Had they previously agreed to abide by their decision?—It was they themselves who gave notice to the Board of Trade. They gave us notice to appear, and we did appear, at least, we expressed our willingness to appear, and we wrote to the Board of Trade to say that we were perfectly prepared to meet them at any time. Then, with regard to interference upon the canal generally, and as to the supply of water, I have caused the engineers, both of the Kennett and Avon Canal and also of our Stratford Canal, to write me, and their letters I have brought with me, in which they state that the fullest supply of water has always been maintained in the canals. In fact, "that if the canals "had been owned by competing companies a fuller supply "could not have been maintained." Then I see that some questions have been asked by some of the members of the Commission as to the comparative rates charged by canal and railway companies prior to the opening of railways. I have brought some information upon that point, both as regards the London and Bristol trade, and also the London and Birmingham trade, which I will submit to the Commission, if they wish it. This is a statement of the rates between London and Bristol:

RATES.—LONDON and BRISTOL, by CANAL, in the YEARS 1820, 1830, 1840, and RAILWAY in 1866.

ARTICLE.	Rates by Canal, including Collection, Delivery, and Wharfage per Ton.						Railway Charges, including Collection and Delivery, per Ton.	
	1820.		1830.		1840.		1866.

Sugar Rates by Rail.

Raw and refined sugar, 5 ton lots and upwards - 15*s.* S. to S.
Do. do. - 18*s.* 4*d.*, collected in London only.
Sugar and molasses, O. risk, delivered by barge alongside wharf, and Thames 10 ton lots. If insured, 1*s.* per ton extra. To be warehoused free 14 days, after that time 3*d.* per ton per week - 16*s.* 8*d.*
Titlers 10 ton lots - - - - 15*s.* S. to S.
„ „ collected in London only - 20*s.*
Bath to London, rates by canal 3*s.* per ton less than above.

I have also the same information with regard to the London and Birmingham traffic.

11,933. (*Sir R. Hill.*) Are those selected articles, or are they a specimen of all the charges?—These goods are the staple trade of Bristol.

11,934. Are there any instances in which the charge by railway exceeds the charge by canal?—I should say certainly not.

11,935. (*Chairman.*) Does that list include all the most important articles of trade?—Yes.

11,936. (*Mr. Hamilton.*) Have you personally examined Mr. Wilson's evidence?—Yes, I have read it.

11,937. Do you see what the nature of his charge is; it is not that the railway now charge more than the canal did; his charge is this, that if the canal had continued in independent hands, and there had been no amalgamation, the canal, in order to pay its way, would have been compelled to give the public lower rates than the railway and the canal jointly now do?—I think I could give an instance which would show the contrary, although I have no doubt there are cases where the canals would be able to keep up competition. There is a canal running up the Stroud Valley to Cirencester and all that district; that canal is nearly choked up with weeds; it is in the hands of an independent canal com-

pany, who would be very glad to get trade upon it if they possibly could.

11,938. You think that the canal would most likely have been entirely stopped by the competition with the railway?—For instance, between Liverpool and Staffordshire or between London and Staffordshire; I do not say so.

11,939. But in this particular case?—Yes, I think so.

11,940. Mr. Wilson's observation is this, in answer to question 9971, "I contend that if the canal had been "free it would have taken probably one-fourth of the "toll, and have been driven to take it, and have suc- "ceeded by taking it." Do you agree with that?—In 1844, when the canal was independent, the toll on the canal was 8*s.* 6*d.*; when the railway was opened it was reduced to 2*s.* 6*d.*, at which it now stands. With regard to the Kennett and Avon Canal we carried the through boats on it until we got no trade at all; in fact it is only recently that we have given up carrying between London and Bristol by canal; we continued to carry at the same rates as had been in force before. There are steamers running between Bristol and London in competition with us, and we thought it desirable to allow an outlet for the traffic at a lower rate where the parties did not desire speed, but we had so little traffic that we dropped the boats; first we ran three times a week, then once a week, then once a fortnight or thereabouts, and then we dropped them altogether.

11,941. Therefore your opinion is that the more probable result would be that the canal would be shut up than that it would have carried at lower rates than the railway now carry at?—Yes, in this case; I could not speak as to others. On our Stratford Canal we do give low tolls now, and we also carry in our boats at low rates, but only for heavy produce, minerals, manure, coals, and so on.

With regard to Mr. Wright's evidence, I can only say this, that we do charge glass at reduced rates at the owner's risk, and where the company have not been to blame for any damage done we decline to pay. That I have always held to be both legally and otherwise a fair arrangement.

Then Mr. Wright, in answer to questions 632 and 643, makes a great complaint that we charge "smalls" in a particular way. I will hand in a statement showing that he is under a misapprehension altogether; in fact the clearing-house classification, under the head of "smalls," shows that, "When two or more packages, "each under 1 cwt., and of different classes, are sent by "one consignor to one consignee, their weights are added "together, and the rate charged is that which, according "to the classification, would be charged, if all the "articles belonged to the highest class in which any of "them is placed, but whatever the aggregate weight of "the consignments may be no less charge is to be made "than that which is made for the maximum weight of "smalls. If the parcels be from different consignors, "or from one consignor to different consignees, involv- "ing separate deliveries, they are charged for sepa- "rately." This is the statement which I have to make on that point. I have taken one case which he gives—a bag of copper nails, a bag of vegetable ivory, and a crate of japan ware, for which the charge would only be 1*s.* 8*d.*, but he makes it 2*s.* 10*d.*

11,942. (*Capt. Galton.*) Does not he give what he actually paid?—I think he gives that as a probable case. I think you will find that in answer to question 633 he says that a parcel would be "divided into "two or three parcels, and the railway company will "charge separately for those parcels, thereby doubling "the rate of carriage on that particular cwt. of goods." He is under a mistake altogether in that respect.

11,943. If they were sent by one consignor, you state that they would be allowed to go in one parcel?—Yes.

11,944. Or they would be charged as one parcel?—Yes.

11,945. According to the highest class?—Yes.

11,946. Then it would be a disadvantage in some cases, would it not?—No; because, of course, when it comes to so heavy a weight, that is, when it becomes above the weight charged for smalls, it would be charged by the cwt., and sometimes be charged by itself. The public, in fact, would get the advantage in either case. If it comes to a tonnage rate we charge by tonnage rate.

11,947. Then it is a much lower rate than the rate for smalls?—Yes, quite so. Take the case of a bag of nails, a bag of vegetable ivory, and a crate of japan ware weighing 2 qrs. 4 lbs., the rate in the way that he puts it would be 4*s.* 6*d.*, that is 1*s.* 6*d.* for each small. The aggregate weight is 1 cwt. 0 qrs. 4 lb., which, at 32*s.* 6*d.* per ton, being the highest rate for japan ware, comes to 1*s.* 8*d.* So that, in fact, we charge him 1*s.* 8*d.* instead of 4*s.* 6*d.* It is his impression that all companies do the same; but, as I pointed out, it is the clearing-house regulation.

11,948. (*Chairman.*) If the weights were less, what would it be?—If the weights were less it would then be 1*s.* 6*d.*, because 1*s.* 6*d.* is the minimum for smalls. In the instance which I give I give the London rate. With the permission of the Commission I will hand in this table:—

CORRECTED STATEMENT as to the MODE of CHARGING SMALLS.

See Mr. J. S. Wright's Evidence. Questions 632 *and* 633.

BETWEEN BIRMINGHAM AND LONDON.

MR. WRIGHT'S STATEMENT.					CORRECTED STATEMENT.					
ARTICLES.	Weight.			Charges.	Weight.			Rate according to Classification.	Charge that would be made by the G. W. Co.	Difference in Charge as stated by Mr. Wright.
	Cwt.	qr.	lbs.	*s.* *d.*	Cwt.	qr.	lbs.	*s.* *d.*	*s.* *d.*	*s.* *d.*
1 bag copper nails	0	0	26	1 6	0	0	26	21 8		
1 „ vegetable ivory	0	1	2	1 6	0	1	2	27 6		
1 crate japan ware	0	2	4	1 6	0	2	4	32 6		
				4 6	1	0	4	@ 32 6	1 8	2 10
1 bag brass tubing	0	2	4	1 6	0	2	4	40 0		
1 „ brass wire	0	1	2	1 6	0	1	2	27 6		
1 „ iron wire	0	0	26	1 6	0	0	26	27 6		
				4 6	1	0	4	@ 40 0	2 1	2 6
1 truss bristles	0	0	24	1 6	0	0	24	32 6		
1 bag corks	0	1	6	1 6	0	1	6	40 0		
1 elephant's tooth	0	2	14	1 7	0	2	14	50 0		
				4 7	1	0	16	@ 50 0	2 10	1 9

When small packages, each under 1 cwt., are sent together from one consignor to one consignee, the weight of the whole is charged at the highest rate to which any of the goods belong.

J. Grierson, Esq.

15 Feb. 1866.

11,949. (*Capt. Galton.*) You say that all the railway companies do the same. They do the same for through traffic, but do they always abide by the clearing house rules for local traffic?—As far as I know this is a regulation adopted by nearly every railway company.

Mr. Wright refers to an advance of the rates between Birmingham and South Staffordshire and Liverpool taking place, as he states, when the Great Western Railway Company opened their railway to Birmingham. The circumstances were these. The two Shrewsbury railways were independent, and a competition arose between them and the London and North-western Railway Company, when the rates, certainly, from South Staffordshire were reduced to a very low sum indeed, and the fares also were very much reduced. So low, indeed, were the fares reduced and to such an extent was the competition carried on, that the Shrewsbury lines did not pay any dividend. In fact, for one or two half years they had a deficit instead of covering their working expenses. At the time when the Great Western Railway was opened from London to Birmingham, they having an agreement with the Shrewsbury lines, the competition undoubtedly ceased and the rates reverted back to the position in which they were before. That really was not a general advance of rates, but merely reverting to what was a fair paying rate.

11,950. The competition was between the London and North-western and the Shrewsbury lines?—Yes.

11,951. Which ceased as soon as the Great Western Company got access to them?—Yes.

11,952. (*Earl of Belmore.*) How did the Shrewsbury lines get access to London during the time that the competition was going on?—The competition was only between Birmingham, Wolverhampton, Shrewsbury, Chester, and Birkenhead.

11,953. (*Chairman.*) Were the fares very low indeed at that time?—I think the passenger fares, if I remember rightly, from Wolverhampton to Liverpool were about 7*s.* first class, and from Wellington to Shrewsbury, a distance of about 12 miles, the fare got down to 1*d.* I see that a good deal of evidence has been given before the Commission as to the effect which low fares would have, and I have endeavoured to get from our old books the result of competition, but unfortunately some of the books are missing, otherwise I proposed to lay before you statistics of the number of passengers that were carried. It is found that, although the public may take advantage of low fares for a time, yet certainly for long distances they will not do so permanently to a great extent. However, that is the explanation with regard to the advance of rates which Mr. Wright there refers to. He appears to consider that Birmingham has derived no advantage from the railways, and upon that I have got out the information as to what the charges were from Birmingham to London and Liverpool by the canal before, and which, if you wish it, I will put in.

11,954. (*Capt. Galton.*) His complaint is that Birmingham is in a bad condition because it has no sea board?—I could understand his making that complaint, but I think that the arrangements which the railway companies have made certainly overcome that disadvantage as far as could fairly be asked for, but if he says that Birmingham has not benefited by railways as against the old mode of conveyance he must have forgotten what the charges were before railways were made.

11,955. They were very much higher of course?—Yes, considerably higher. When I was in Bristol last Saturday, I asked a gentleman who had been a carrier what the rates for packs of Manchester goods used to be from Manchester to Bristol before the railway was opened, and he told me 6*l.* a ton and 1*l.* a ton for delivery in Bristol. At present the rate is 30*s.* a ton including collection and delivery. I should mention this with regard to Birmingham, that there are the London and North-western Railway, the Midland Railway, and the Great Western Railway carrying to London; there are the London and North-western and the Great Western railways carrying to Liverpool, and the Shropshire Union Canal, and the Bridgewater Trustees Canal, and to London the Grand Junction Canal, and upon two of those canals there are a number of private carriers.

11,956. Do the Midland Company carry from Birmingham to London?—Yes, they do.

11,957. (*Chairman.*) It is a very circuitous route, is it not?—The Midland route would be about 135 miles, I should think, against the Great Western 129 miles, and the London and North-western 112 miles.

11,958. (*Capt. Galton.*) Their line is by Leicester, is it not?—Yes, by Leicester.

11,959. It is only recently that they have taken to the London traffic?—Probably about a year.

Then with regard to Mr. Sturge's evidence, I would simply make one remark, that Gloucester being the nearest port for Birmingham, if mileage rates were in all cases charged from Gloucester, it is quite probable that it would give that port an advantage in supplying the whole of Birmingham and South Staffordshire; but we consider that that would be very unfair towards Liverpool and Birmingham, and therefore we do not in all cases charge mileage rates. We consider that Gloucester is very favourably situated in having competition by the canal and river at very low rates, and we think it is very much better for the interests of the district, and certainly for the interests of the railway company, that we should give Liverpool and London a fair chance of supplying a portion of the timber, grain, groceries, and so on, required in that district. I do not know that I have any further remarks to make upon the statements made in the evidence which has been given before the Commission.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Friday, 16th February 1866.

PRESENT:

The Right Hon. the Earl of Belmore.	Geo. Carr Glyn, Esq., M.P.
The Right Hon. Lord Stanley, M.P., F.R.S.	Capt. Douglas Galton, R.E., C.B., F.R.S.
The Hon. E. F. Leveson Gower, M.P.	William Pole, Esq., F.R.S., *Secretary.*
Robert Dalglish, Esq., M.P.	

His Grace THE DUKE OF DEVONSHIRE, K.G., F.R.S., in the Chair.

Capt. W. O'Brien.

16 Feb. 1866.

Captain William O'Brien examined.

11,960. (*Chairman.*) You are General Manager of the North-eastern Railway Company?—I am.

11,961. Have you seen the evidence given before this Commission by Mr. Atkinson and Mr. West, of Hull, in reference to the management of the traffic on the North-eastern railway?—I have.

11,962. Have you observed that the complaints made chiefly referred to advantages given to Hartlepool and other northern ports as compared with the port of Hull?—Yes.

11,963. Will you be good enough to state the principle upon which the railway company, whose manager you are, have arranged and settled those charges?—The first point, as I understand the evidence, that was made by Mr. Atkinson and Mr. West was, that the North-eastern Company favoured the docks at Hartlepool and

other more northern ports to the detriment of the docks at Hull, and it may probably be sufficient to state that the North-eastern Company have never hesitated to give substantial pecuniary support to the docks at Hull, although for the money so expended they do not receive or ask any exclusive or even any preferential advantage. The carriage of the additional traffic brought to the Hull Docks in consequence of the accommodation provided by means of the North-eastern Company's money is not secured to the North-eastern Company, but is shared with other and rival companies. Previous to 1861 the complaints at Hull of the mismanagement, the inadequate accommodation, the high charges, and the high dividends of the Hull Docks Company had become so serious, that the leading merchants and shipowners of Hull promoted a rival dock company to remedy the evils under which they were suffering. At their request the North-eastern directors agreed to support the new company, and to subscribe 50,000*l.* towards its capital. In 1861 the new company failed in Parliament, but an Act was obtained for remodelling the management of the docks at Hull, and providing increased accommodation. The works are in progress, but there being some difficulty in procuring the requisite capital, the North-eastern Company was again applied to by the Hull merchants for assistance. The Dock Company had no claim whatsoever upon the North-eastern Railway Company, but nevertheless the directors subscribed 50,000*l.* to the undertaking, and have paid about one-half of it.

11,964. (*Capt. Galton.*) Is that all the money that they have expended towards the docks in Hull?—Yes.

11,965. (*Mr. Glyn.*) What has been the total sum of money which has been laid out upon the docks?—I do not know, and it could not be very easily given, because they have expended a large amount of their revenue.

11,966. Has that been expended upon the new docks?—I do not know.

11,967. Do you know what proportion the contribution made by the railway company bore to the whole sum expended?—I do not. The next point was as to the charges of the railway company on the Hull timber traffic, which were stated to be exorbitant. Mr. West, in answer to question 1026, states that the Hull timber traffic has been unquestionably driven away to Hartlepool by the exorbitant charges of the railway company, and it will probably be sufficient to refer to the evidence given on this point by Mr. Clark, Chairman of the Railway Committee of the Liverpool Chamber of Commerce. His complaint was that the rates on timber and deals sent from Hull, so far from being exorbitant, were unfairly low. The third point was as to the timber trade being driven away from Hull to Hartlepool. Mr. West represented that the timber trade of Hull was restricted by the action of the North-eastern Company and driven to Hartlepool. In proof, he asserted that four-fifths, if not nine-tenths, of the timber sent to Hartlepool in 1864 were sent by Hull merchants for their own trade, and not for local consumption at Hartlepool. The fact, however, is that more than one-half of the timber carried inland from West Hartlepool in 1864 went to places so much nearer Hartlepool, that timber imported at Hull cannot compete at those places except by the adoption to an absurd and impossible extent of the very principle to which Mr. West objects. He represented that the Hull timber trade was only increasing slowly, but omitted to state that the timber trade of the Humber—whatever may be the case as to Hull, where the accommodation is admittedly inadequate, is increasing rapidly, the importations at Hull and Grimsby having increased from 129,839 loads in 1855 to 360,226 loads in 1864, or 277 per cent. He attributed the slow progress of Hull to the increase of the trade at Hartlepool, a port 80 miles off, but omitted to draw the attention of the Committee to the progress of the rival port of Grimsby, which is on the same river as Hull, and at only 20 miles distance, and whose timber traffic has increased rather faster than that of Hartlepool. Comparing the year 1862 with 1864, Hartlepool has increased from 85,724 to 136,005 loads, and Grimsby has increased from 81,214, to 136,421 loads. As the railway rates from Grimsby are the same as those from Hull and Hartlepool, it is obvious that if the progress of the timber trade at those ports depended, as is represented by Mr. West, solely upon the railway rates, Grimsby would have suffered equally with Hull by the competition of Hartlepool. The increase, however, of the Grimsby traffic seems to negative this idea, and to suggest that the comparatively slow increase of the Hull timber traffic is due to some other cause. This conclusion is strengthened by the consideration, which is a material one though not mentioned by the witnesses, that more than half of the Hull timber traffic is carried inland by water communication, and is altogether unaffected by the Hartlepool rates.

11,968. You would attribute the decrease of the timber trade at Hull to the want of accommodation there?—The timber trade at Hull has not decreased, but, on the contrary, it has increased.

11,969. But the absence of further increase is probably owing to the want of accommodation?—Yes. I will venture now to quote from the speech of the Chairman of the Hull Dock Company at the general meeting of that Company on the 2nd February last. He stated :—"We have had a year of very con-
" siderable prosperity, and have been able to accom-
" modate the trade of this port to an extent to which
" in former years we could with difficulty attain. We
" have been able to accommodate a greater amount of
" steam tonnage than we have in former years. The
" enlargement of the Victoria Dock and the extension
" of the timber pond space has done very much to-
" wards the prosperity to which I have now the pleasure
" of directing your attention. Taking, for instance,
" oranges ; the list of ships appears somewhat as-
" tonishing, when the trade began so recently as
" 1837–8. We had then only 10 ships bringing
" 4,500 packages, whereas in 1864–5 we had 79 vessels
" bringing 79,634 packages." He then refers to the timber trade, and states, "I am glad to find that the
" trade in this article has during the last year also very
" considerably increased. It shows an increase in 1865
" of 23,757 loads, which is a very satisfactory state of
" things, as we have been given to understand from quar-
" ters supposed to be informed that our timber trade was
" gradually falling off. In reference to another trade,
" there has been during the last year a marvellous in-
" crease in the amount of the importation of fish.
" In 1852 we had in this port 8,159 packages.
" During the year 1865 we have had the large amount of
" 197,991 packages of fish, employing a very large
" fleet and a great number of seamen." Another dock director, himself largely interested in the steam trade and affected by the competition of the port of Hartlepool, adds :—"Since the North-eastern Company got
" possession of Hartlepool, and that port was managed
" honestly and faithfully, the traders of Hull will find
" their own prospects improved. Now that Hartle-
" pool is fairly balanced against Hull, they might be
" sure Hull would take its right place and not be en-
" dangered by any competing ports."

I will now go to the larger questions, of which the principal one is, that we have ignored the geographical position of Hull. The allegation against the North-eastern Company is, that the same gross charge is made between Normanton or Leeds or places beyond and Hull, and between those places and Hartlepool, the distance to Hartlepool being greater than that to Hull. The remedy proposed, in answer to question 1041, is a uniform mileage rate by the railway company, from which they should have no power to deviate ; and Mr. Atkinson says, that he has no other suggestion to offer.

Now the company state that the principle to which objection is made has been adopted by them on full consideration, and with a view to the requirements of trade and public advantage, and that the measure proposed by the Mayor of Hull is impracticable, and if attempted would destroy a large amount of the traffic of the kingdom. This principle, as affecting the North-eastern Company, has been argued before committees

apt. W. O'Brien.

16 Feb. 1866.

of the Houses of Parliament on nine separate occasions. First before a committee of the House of Commons, of which Mr. Divett was chairman, on the North-eastern Amalgamation Bill of 1854, when the corporation of Stockton-on-Tees argued the question as affecting the port of Stockton, and tendered an equal mileage rate clause and a like distance clause, but the committee rejected these clauses and passed the bill; 2ndly, before a committee of the House of Lords, of which the Duke of Buccleuch was chairman on the same bill, the same parties appeared and tendered the same like distance clause, which the committee unanimously rejected, and passed the bill; 3rdly, before a committee of the Commons, of which Mr. Puller was chairman on the North-eastern, Hull, and Doncaster Branch Bill, 1862. Witnesses from Hull appeared but no clauses were tendered, and the committee passed the bill; 4thly, before a committee of the Lords, of which Earl St. Germains was chairman on the same Bill. Witnesses from Hull appeared but no clauses were tendered. The committee rejected the bill, not with reference to this, but on a question as to the proper place of crossing the River Humber; 5thly, before a committee of the Lords, of which the Duke of Montrose was chairman on the re-introduction of a similar bill in 1863. Witnesses from Goole appeared and tendered an equal mileage rate clause for the protection of the port of Goole, but the committee rejected the clause and passed the bill; 6thly, before a committee of the House of Commons, Mr. Scourfield being chairman, on the North-eastern and Stockton and Darlington Amalgamation Bill of 1863. The corporation of Hull and the merchants of Hull appeared and tendered an equal mileage rate clause. The committee rejected the clause and passed the bill; 7thly, before a committee of the Lords, of which the Earl of Donoughmore was chairman, on the same bill. The same parties tendered a "Hull three-fourths of "rate to other ports" clause, embodying the same principle, but again the committee rejected the clause and passed the bill; 8thly, before a committee of the Commons, of which Mr. Cobbett was chairman, on the North-eastern and West Hartlepool and Cleveland Amalgamation Bill of 1865. The same parties appeared and tendered an equal mileage rate clause, and a clause requiring the dues, rates, and charges at West Hartlepool Docks to be not less than those at the Hull Docks. The committee rejected both clauses and passed the bill, introducing, with the concurrence of the North-eastern Company, a clause (37) prohibiting the company from obstructing the shortest and most convenient route, and from making higher charges for services rendered at Hull than for like service at West Hartlepool; 9thly, before a committee of the Lords, of which the Earl of Devon was chairman, on the same bill. The same parties tendered the same clauses, which the committee rejected without calling on the company for a reply, and they passed the bill. So that the Commission will see that on nine separate occasions, and during a period extending over 11 years, the ports of Stockton-on-Tees, Hull, and Goole, have applied to Parliament to sanction the principle contended for by the Mayor of Hull before the Commission. On one occasion the committee came to no decision, the bill having failed upon other grounds, and on the other eight occasions the committee refused to sanction the principle. If the Commission think it desirable I am prepared to state the arguments which we think should lead to the rejection of this principle on grounds of public policy.

11,970. (*Chairman.*) Will you be good enough to proceed?—The evidence is confined to the North-eastern Railway. The practice, however, is not peculiar to that company, but is adopted by all the railways in the kingdom. Then it must not be assumed as a matter of course that the Mayor of Hull represents on this point the merchants and traders of Hull. On the 7th March 1862 a deputation from Hull waited on the North-eastern Board at York with reference to this question, and at that meeting three members of the deputation made in writing the following three requests:—Mr. West requested that the rates of carriage to and from Hull should be less in proportion to the distance than those charged to and from Hartlepool or other northern ports. Another member, Mr. Lumsden, representing the Hull Chamber of Commerce and the shipowners, requested that the North-eastern Company would protect the port of Hull against all competing ports by guaranteeing the same rate of inland carriage to and from all districts in connexion with those ports, the competing ports specially intended being Newcastle, Sunderland, West Hartlepool, Goole, and Grimsby. To this proposal the following reply was given in writing:—"It will be apparent that the "North-eastern Company cannot give effect to the "principle of Mr. Lumsden's question, and at the same "time adopt Mr. West's request, as the two are not "consistent." Then another member, representing the owners of steamers and the coal merchants at Hull, requested that the railway rate on coals to Hull should be the same as that to Grimsby. And upon several occasions merchants from the West Riding and Lancashire have represented to committees of Parliament the importance of refusing this principle, as it would deprive them of the advantage of using various routes and various ports. On the 16th April 1863, a meeting was held at York of steamship owners and others interested in the Hamburgh and Rotterdam trade through the ports of Hull, Goole, Grimsby, and West Hartlepool. At this meeting they agreed to charge equal through rates between the ultimate points in England and on the continent, and equal sea freights between the respective ports, and requested the manager of the North-eastern Railway to communicate with the gentleman representing the Newcastle steamship interest, and urge him to join in the arrangement. The basis of the whole combination being that where through routes exist equal through rates must be charged, as any disparity of rate would give one route a monopoly of the traffic. Where several competing routes exist it will destroy that competition and restrict the traffic to one route only, and in some cases to the worst route. Where ports compete it will destroy that competition and restrict the traffic to one port without regard to the goodness of the port, the facilities for shipping, the number of vessels trading, the probability of obtaining a return cargo, the dock charges, the local expenses, and the sea freights. Then the principle of charging the same rate per ton per mile for long as for short distances, would not only annihilate a large traffic and produce most ruinous consequences to trade and manufacture, but is the opposite of that enacted in the toll clauses of railway Acts. The principle of charging different gross rates over competing lines where the distances are unequal is directly opposed to several Acts of Parliament, which prescribe that in such cases, provided that the competing routes are not unreasonably circuitous or inconvenient, the same gross rates shall be charged. Acts of Parliament have been obtained upon the understanding that this principle would be observed; sometimes it has been directly enacted by clauses, and sometimes it is embodied in agreements confirmed by Parliament and scheduled to the Acts; and at other times it has been enacted that the rates shall be settled by arbitration. If the principle be adopted, it will have a far wider range than its promoters imagine, for it will destroy a very large portion of the traffic of the kingdom, and will prevent the quotation of low rates in cases where it is the interest of all parties to adopt them. The proposal resolves itself on examination into an application that by some legislative enactment the commerce of the country shall be placed under such restrictions as shall confine the route of certain traffic to Hull, and protect the Hull merchants, shipowners, local agents, and establishments from competition.

11,971. (*Mr. Glyn.*) As a general rule, is not the charge always determined by the shortest route; at least generally, if not invariably so?—It is not that exactly. The fixing of the rate depends upon a different set of circumstances altogether, and not upon

the actual length of the route; in reality it is regulated—that is, within the parliamentary powers—by what we think the traffic will fairly bear.

11,972. In the case of the shortest line, does it not often happen that the rates upon it are raised in consequence of the system which is adapted?—No, it is not that either. If the traffic between two points will bear a certain figure, say 30*s.*, then it must be applicable to all the competing routes between those two places, without reference to the length of the route, unless it becomes excessively circuitous, and then that route does not get any of the traffic.

11,973. Then the charges are determined more upon commercial principles than upon any other principle?—Clearly so. The railway system is established, and the legislature has deliberately established it on commercial principles, and it is so acted upon but always within their powers.

11,974. (*Lord Stanley.*) You do not think that you can carry goods at equal rates, whether the railway on which they are carried has cost much or little, or whether the amount of traffic is remunerative or not?—The cost of the railway does not enter much into it, but of course the question whether the rate charged was remunerative or not, would enter into it at once.

11,975. (*Capt. Galton.*) It is alleged by Mr. Clark in his evidence that you carry timber from Newcastle to Hull at the rate of $\frac{73}{100}$ of a penny per ton. Is that a remunerative rate?—You must first settle clearly what you mean by "remunerative," because that is a word the meaning of which is ambiguous. In one sense it is remunerative if we get more than the bare working expenses. In another sense it is not remunerative, unless it not only clears the working expenses but bears its fair proportion of what is necessary to give a commercial dividend upon the capital which has been expended on the road.

11,976. If you charge a rate which is only barely remunerative, or only gives a slight profit over the actual cost of conveyance between two towns, I presume you must charge between other towns a higher price in order to give the required dividend upon the capital invested?—We do charge a higher rate, but not for the reason that you suggest. You say that we must charge high in the one case because we charge but little in the other, but that is not exactly the way in which these matters are settled. We charge as a higher rate what we think the article will bear fairly, and with regard to a lower rate we must either carry it for very little, or not have it at all; and, therefore, having to make a choice, we take it for very little. But that does not affect in any way what we charge on articles that will bear a higher rate of charge.

11,977. In which class do you reckon the $\frac{73}{100}$ of a penny per ton for timber carried between Newcastle and Hull—in the remunerative class, or in the less remunerative class, or in which class?—We have no such classes.

11,978. You stated just now that there were two points to be considered in discussing the question whether traffic was remunerative or otherwise, and that in one class a profit was returned on the capital invested, while in another the return was slightly over the cost of the conveyance. In which of those two classes would you place the timber that was conveyed from Newcastle to Hull?—It is a question of degree entirely, but at the low rate you mention no doubt it would not do very much more than pay the working expenses.

11,979. Why do you charge a low rate upon timber conveyed from Newcastle to Hull?—Because it would go by sea otherwise, and we must therefore charge a lower rate to carry it.

11,980. (*Chairman.*) By which route does timber go from Newcastle to Hull?—I do not believe that there is what would be called a regular trade, but there are occasionally cases in which the people at a port do not find exactly the class of timber that they want at the moment, and they go to another port for it.

11,981. (*Capt. Galton.*) What are the rates charged between Hartlepool and Liverpool as compared with the rates charged between Hull and Liverpool?—The gross rate is the same.

11,982. What are they between Newcastle and Liverpool?—They are generally the same gross rate also.

11,983. Between all the ports you charge the same gross rate?—Yes, as nearly as practicable.

11,984. What interest has the North-eastern Company in Hartlepool?—In the town of Hartlepool they have the docks.

11,985. Do they receive all the dock dues?—Yes.

11,986. Do they receive the dock dues in any other port?—From their own dock in the Tyne they receive the dues also.

11,987. Are the rates from Hartlepool as a rule higher or lower than from other ports?—They are the same as at the competing ports, Grimsby, Hull, Hartlepool, and Newcastle. We carry out the universal principle that where ports compete the through traffic must be charged the same, or you will shut up one of them.

11,988. You do not give any additional facilities to the Hartlepool Docks over other ports, although you have a larger interest in Hartlepool than in the other ports?—We give no facilities to the Hartlepool route over the others; not to one over the other.

11989. (*Chairman.*) Has the North-eastern Company a larger pecuniary interest in West Hartlepool than in any other port?—No; they have a dock of their own in the Tyne in which they have a large pecuniary interest; they have no interest in the docks at Hull; Grimsby is a rival port. The question of pecuniary interest in docks does not affect the question, because we go upon the principle of putting all the ports, as nearly as we can, on an equality with each other.

11,990 (*Mr. Gower.*) If you had no interest in any docks or any port, would you charge the same rates as you do now?—That condition of things actually exists. We have a great interest in the port of Hartlepool, and we compete against the port of Grimsby in which we have none, but the rates are exactly the same; we do not try to turn the scale one way or the other. Perhaps I should mention that originally, speaking of the line from Leeds to West Hartlepool, there was an independent company for a considerable length; part of it was the "Leeds "Northern Railway," and about 12 or 14 miles of it was the "West Hartlepool Railway." When we amalgamated with the Leeds Northern Company, this question came up. The traders said, "We cannot "allow the competing line to pass into the hands of a "company who have their own line already existing "at Hull, on which they have spent such a large sum "of money, unless we have some security that the "Hartlepool Railway shall not be shut up for the "benefit of Hull." We said that we considered that that was quite fair, and we acceded to that principle; it was debated in the Committees of Parliament, and we then said we should adopt the policy that we had always followed of putting the two ports, as nearly as we could, on the same footing, and we carried that understanding out honourably, without reference to whether we made more of the traffic by sending it to one port rather than to the other.

11,991. (*Mr. Glyn.*) No clauses were put into the Act of Parliament?—No; at that time the port of Hartlepool was not ours.

11,992. (*Capt. Galton.*) Mr. Wright, of Birmingham, who was examined, stated that the rates from Birmingham to Hartlepool were lower than the rates between Birmingham and any other part of the country?—It may be so, but that is a matter that would not concern us in any way.

11,993. Except that you would have to give a rate?—No; we could only give a rate over a portion of the route, that is, from Hartlepool to Normanton, that is all that we have any control over. If the North-eastern, the Midland, and the London and North-western companies, the last companies having routes to Birmingham, agreed upon a certain rate between Hartlepool and Bir-

Capt. W. O'Brien.

16 Feb. 1866.

mingham, it would be put in force, but without any consideration as to whether it was higher or lower than other rates.

11,994. Have any other companies besides the North-eastern any interest in Hartlepool?—None but the North-eastern Company.

11,995. (*Earl of Belmore.*) Do you ever charge special rates to individuals?—No, except in this way; we give special rates for special transactions; as, for instance, an ironmaster on the Tees may have a contract for some heavy bridge in India, and he comes to us and says he would like to ship them at Liverpool, if we will give him a rate low enough to induce him to send it by railway. In such a case we should consider the matter, viewing it as a question of quantity of traffic, and that we must take a low rate or not get the carriage of it at all, but without any reference to the individual whatever, and every individual who should come to us with such a proposition as that would be treated on the same terms.

11,996. (*Mr. Glyn.*) I think that amounts to this, that there being a means of conveyance by sea, your rate would be driven down to the lowest remunerative point for that particular transaction?—It would, and it would be carrying out exactly the old principle in another shape. If we cannot get as much as we should like, we carry for as much as we can get, so long as it just pays.

11,997. (*Chairman.*) Have you made arrangements with other companies for equal rates as respects Hartlepool and Hull, and all the principal towns in Yorkshire and Lancashire?—Yes.

11,998. Does that agreement extend to towns in the Midland counties, such as Birmingham?—Yes.

11,999. I understood you to say that you were not aware what the charge was from Hartlepool to Birmingham?—No.

12,000. But with respect to Hartlepool and Liverpool you were aware that the charge was the same?—It is the same as that from Hull to Liverpool. I have no doubt that the same principle is followed, and it is the same as to Hull.

12,001. I think it has been stated that from Birmingham to Hartlepool the charge was lower than from Birmingham to any other port?—It could not be lower than to Hull.

12,002. Other companies have agreed with the North-eastern Company in general, that it was only reasonable to pursue that system?—They have. A very large proportion of the trade of Hartlepool goes to places to the south-west of any termini of the North-eastern Railway, and in all those cases the rate is fixed in concert with the other companies.

12,003. There must be many places of importance nearer to Hartlepool and the northern ports than to Hull. Do you carry out the same rule in those cases and charge as much to West Hartlepool as to Hull?—No, because at last there comes a point at which the discrepancy would be so great that the principle is abandoned; for instance, we could not carry coals from a Durham coal pit to Hull at the same gross rate that we could carry them to Hartlepool for.

12,004. Is there any considerable trade from places near to Hartlepool and the Tyne; to Hull, for instance?—No, there is no place there of any importance.

12,005. (*Earl of Belmore.*) Although you do not carry at the same gross rate from the Durham coal pit to Hull as to Hartlepool, would you carry at the same rate per mile?—To Hull we should carry at a much lower rate per mile. To Hartlepool the rate would probably be a penny, or something more, while the rate to Hull would be a halfpenny.

12,006. Is a halfpenny a ton per mile a remunerative rate in the sense that it will cover the working expenses?—Yes. In many cases the circumstances may be such that a halfpenny a ton per mile may leave a very good profit, while in other cases it will not nearly pay the working expenses.

12,007. (*Lord Stanley.*) That depending upon the amount of traffic sent, and under what circumstances?—It would depend upon the amount of traffic sent, the length of the line, the working of the engine, the number of miles we could get out of it, and the gradient. We have some coal traffic, as to which, an engine runs 160 miles in a day, including bringing the waggons back empty, and on other parts of the line we cannot get above 62 miles out of an engine, that is, 31 miles of paying mileage in a day; that is also over a bad gradient. Therefore a halfpenny rate when running 80 miles on a good road with a heavy load may be far more profitable than a penny rate with an engine running only 31 miles and drawing a lighter load.

12,008. (*Capt. Galton.*) What is the load that you calculate as being a paying load?—I could only say that one is more paying than the other. On a level line we should run 50 waggons containing from six to eight tons.

12,009. And what upon the other lines?—Then we come to the gradients, which might bring it down to 20 chaldron waggons.

12,010. (*Earl of Belmore.*) I suppose in all cases the actual cost of working traffic of that description depends in some measure upon the gradients?—Yes, in some measure; the length of the lead is also a most material point. In our coal districts, where an engine is making a great many short trips in a day, say, eight of 10 or 12 miles, that is a very different thing from one long clean run of 80 miles.

12,011. (*Capt. Galton.*) Can you make any comparison to show what would be a paying load with 60 miles of work done by the engine, and what would be a paying load with 160 miles run by the engine as a day's work?—No, nobody could do that.

12,012. (*Mr. Glyn.*) In that case you would have to consider the question of the gradients throughout the whole distance?—No doubt; and it would ultimately end in an estimate.

12,013. (*Capt. Galton.*) How are you able to say that one rate is a paying rate and that another is not?—It is a point that is always one of very great difficulty in settling. I have known such questions discussed when some persons believed that the rate would not pay the working expenses, and in some cases ultimately you must make a guess at it.

12,014. There is no actual calculation made when you are fixing a rate to see whether it will pay or not?—There is none made. The managers have in their own minds a sort of minimum, below which they will not go, without a very careful and minute investigation into the particular circumstances of the case.

12,015. I think you have shown that that minimum, or say, a halfpenny per ton, would be barely a paying rate for the coal traffic carried 30 miles?—Under all the circumstances it might be a losing rate.

12,016. Do you ever carry traffic 30 miles at a halfpenny a ton?—No, the 30 miles I spoke of were the amount of mileage that we got out of an engine in a day. I meant that a load carried 30 miles was a paying load; not that the coals were carried 30 miles, but that the engine could make 30 miles of paying mileage in a day.

12,017. What paying mileage would it make except when drawing a load of coals?—It was making paying mileage for 31 miles, and that was all it did in the day. If you take the cost of an engine at four or five guineas a day, we have to get that out of a train that earns pay for 31 miles.

12,018. Do you calculate the cost of an engine at four or five guineas a day?—We know, taking our engines on the average for drawing passengers and minerals, that every engine we bring on to the line costs us at the rate of 1,200*l.* a year, exclusive of the interest on the cost of the engine, and the interest on the money expended on the repairing shops.

12,019. What is the average cost of an engine?—They are now getting up to from 2,500*l.* to 3,000*l.*

12,020. (*Lord Stanley.*) For an ordinary engine?—Yes, including the tender.

12,021. (*Capt. Galton.*) Does the 1,200*l.* a year include the repairs upon the engine?—Yes.

12,022. All the expenses for firing, wages, and repairs?—Yes, everything but the cost of the engine, the

cost of the shops, and the interest upon the spare stock that must always be ready.

12,023. Does it also include the renewal fund?—We have no renewal fund set apart.

12,024. Do you provide fresh engines out of revenue?—Yes; that is to say, we repair them out of revenue.

12,025. If you once get an engine started, you would of course keep it in good order?—Yes, and that is done out of revenue.

12,026. Is that included in the 1,200*l.* a year you have mentioned?—Yes.

12,027. If you wear out an engine, and you bring upon the line a better and more powerful one, do you charge any part of the cost to capital?—No, we do not; we charge it all to revenue.

12,028. (*Mr. Gower.*) If there was a uniform mileage rate from the different ports, would not commodities be sent shorter distances than they are under the system which you adopt?—Not necessarily; the distance is not nearly of so much consequence as the question of the dock dues, the facilities at the ports, and whether the communication is once a day or once a week, and also the freights from the ports.

12,029. Putting the facilities on one side, would not a uniform mileage rate cause goods to be carried by the shortest route, whereas your system induces parties often to send them by the longer route?—It would be so. A uniform mileage rate would confine the traffic to one port, that being the port at the end of the shortest line, whereas by the system we follow it goes to the most convenient port.

12,030. (*Mr. Glyn.*) And you also open more ports for the supply of the consumer?—Clearly. If you take four ports competing with each other, and consider the local accommodation, and charges, and the numerous little expenses that commission agents charge, and all the small expenses at a port, it will be seen that each port is kept down by the competition of the other ports, whereas if we adopted a uniform mileage rate it would confine the traffic to one particular port, and advantage would be taken of that state of things.

12,031. A sort of monopoly would be established in favour of that particular port?—Of course.

12,032. (*Chairman.*) You do not at all take into account the difference in the dock dues at different ports, or the vicinity of your railway to the shipping places?—We do not take that into account; we leave the various ports to settle that amongst themselves as they choose.

12,033. (*Capt. Galton.*) Are the dues at Hartlepool higher or lower than at Hull?—As a rule they are lower.

12,034. Are they lower at Hartlepool than at Newcastle?—No, I think they are about the same as at Newcastle.

12,035. Are they much lower than at Grimsby or at Hull?—With regard to Grimsby I can hardly tell you, but I believe in many cases they are lower at Grimsby than at Hartlepool. No doubt our great difficulty is at Hull; we think the dock dues are very high; so do the Hull merchants, and they attempted by an Act of Parliament to compel us to raise our dock charges at Hartlepool to as high a point as those at Hull, but the committee did not approve of it.

12,036. (*Mr. Dalglish.*) The North-eastern Company have a dock on the Tyne; are the dues charged in their own dock the same as the dock dues at Newcastle?—Yes, they are as near as possible the same; we try to put Hartlepool, Sunderland, and our own dock in the Tyne as near as we can on the same footing.

12,037. My question referred to the dock dues. Do you keep the dues in your dock in the Tyne as high as the dues in the Newcastle Dock?—As a rule we do.

12,038. You have been asked some questions about the engines. Do you find that an engine which travels 31 miles a day over bad gradients is worn out sooner than an engine which travels 80 miles a day over a good gradient?—I do not think we can tell you that.

12,039. (*Capt. Galton.*) You stated a certain sum for the cost of engine power. Can you give us any idea of the cost of waggons?—I do not think we could we could tell you how much, on the average, the waggons have cost for repairing in a year; but I do not think it would lead to any conclusion that would be of any use.

12,040. Practically, you make no calculations of that sort; you trust to a sort of intuitive idea that a certain class of traffic will pay?—Long experience has taught us that certain rates will pay, and certain rates will not pay. We get what we can out of the traffic, and when it gets to a non-paying point, we estimate as well as we can what will not pay.

12,041. You may be carrying on, on some parts of your line, a very unremunerative trade, but which is recouped by traffic on other parts of the line?—I have no doubt about this, that for some short distance traffic we carry on a trade that does not pay.

12,042. (*Earl of Belmore.*) Then why do you carry it on?—Because it has been long established, and facilities of that kind help a district generally. A trader, for example, who is doing a large business with us, and a remunerative business, asks us to do some little matter for him which will not be remunerative, and we think that it might appear somewhat ungracious if we stopped short and did not do it; therefore, unless it is a very clear case indeed, we do carry that short-distance traffic at a rate that does not pay.

12,043. (*Mr. Glyn.*) To what class of traffic do you apply that remark; to the coal traffic?—That is the chief trade. We also carry goods and articles up to the collieries; I consider that all that trade is a losing trade; but at the same time it is a very great convenience to the coal trade generally, and it helps them on. We benefit so much by the great coal trade that we are not very nice in affording some of these small accommodations.

12,044. (*Earl of Belmore.*) What do you mean by sending articles to the collieries; do you mean goods for the use of the people employed there?—No; I mean grain for the horses employed in the coal pits; that is sent up the private siding of a colliery, and then there is grease for the engines, and ropes for the engines, and a variety of things which are necessary for working the pits. These we send by the tramways at a rate that does not pay us, but it is nevertheless a great convenience to the colliery owners.

12,045. (*Chairman.*) You could not carry that traffic at all unless at a very low rate?—If we raised the rate to what would pay us, I think the traffic would still go by the railway, but it would cause a great outcry, because people would consider it a great hardship, considering that their traffic yielded us many thousands a a year, if we did not accommodate them.

12,046. (*Mr. Glyn.*) You rather throw that kind of traffic in in the way of general business?—Yes.

12,047. (*Capt. Galton.*) In fixing your rates, do you give one rate to one colliery owner, and another rate to another?—Yes.

12,048. You do not publish the rates?—No; each colliery owner makes his own bargain for his own rates.

12,049. Then one man might get a very favourable rate, and another man a less favourable rate, without their knowing it?—I am speaking now of those things that we send up to the collieries that are required there.

12,050. But you have not a fixed rate for the carriage of those articles?—No.

12,051. Is not that rather unfair to the colliery owner, and would it not, as a rule, be more fair to publish the rate at which you would carry these articles?—I do not think so. Each of these questions is settled upon its own merits; it is one thing to send waggons a distance of 200 yards off the line along a tramway, and it is another thing to send them two or three miles over a bad private line; therefore, every case must be settled on its own merits and according to circumstances.

12,052. Then it must rest in the breast of the general manager to fix what rates he chooses?—Yes.

Capt. W. O'Brien.

16 Feb. 1866.

12,053. (*Lord Stanley.*) You object to lay down any fixed principle of charge for that kind of traffic?—Yes; we cannot do it, the circumstances vary so excessively.

12,054. (*Mr. Glyn.*) You are not obliged to carry traffic over these private tramways, but you do it to oblige the parties?—Certainly; it is entirely a matter of favour to do it at all.

12,055. They are the tramways of the owners of the collieries?—Yes; of the proprietors of the collieries.

12,056. (*Chairman.*) You have stated that an engine on the average costs 1,200*l.* a year. Can you state whether there is any difference between the cost of maintaining and working a passenger engine and a goods engine?—I can hardly answer that question; they are so mixed up that I doubt whether any really reliable answer could be given. The circumstances connected with each particular engine vary so much—for example, one will be running a long mileage, and another will be running a short mileage, and considering the waiting and the shunting at different places, I do not believe that any calculations would be at all reliable.

12,057. Does not a goods engine running over a very heavy road consume more fuel than a passenger engine?—It does consume very much more.

12,058. Does the 1,200*l.* a year include all expenses, for coke, engine driver, and so on?—It includes everything; that is the average upon all classes of engines.

12,059. (*Earl of Belmore.*) In the case of passenger engines, do you find that there is much more wear and tear when the engines run at high speeds with express trains, than when the speed is low and there are many stoppages?—I am not at all satisfied with any of the calculations that I have seen upon this point, but there is no doubt that frequent stoppages form another item of wear and tear. I do not think that anybody is able to balance accurately one against the other.

12,060. (*Mr. Glyn.*) Would you not also have to take into account the state of the line?—I assume that the line is equally good over all its parts.

12,601. (*Chairman.*) You have seen Mr. Oxlade's evidence, and you are, I believe, prepared with an answer to it?—Yes; there are some minor points to which, with the permission of the Commission, I would address myself first, and after having disposed of them, will tender evidence on the more important questions. 1st, Mr. Oxlade gives an account of an interview with Mr. Quelch, the manager of the mineral traffic, the substance of which is that for certain service Mr. Quelch agreed to charge 2*s.* 7*d.* per ton; that for this service the company subsequently charged 5*s.* 2*d.* per ton, and that they kept back the account for three months with the intention of keeping Mr. Oxlade in ignorance of the change. Mr. Oxlade, I should state, was a stationmaster on the railway, and from his protracted litigation with the company, and being concerned in the coal trade himself, is intimately acquainted with the company's regulations and practice. The interview took place in June 1863. The charges of 2*s.* 7*d.* and 5*s.* 2*d.* refer to totally different things; the 5*s.* 2*d.* is the charge from the colliery to York, the coal being conveyed in the company's waggons, and for sale at the company's depôt at York. The 2*s.* 7*d.* is the company's proportion of a through charge for coals conveyed beyond the company's lines in waggons not belonging to the company. There is no connexion between the two except that the coals are conveyed over the same portion of the company's line. The case is analogous to that of a rate on cattle conveyed between Darlington and York in the Company's waggons for sale in the York market, and the proportion applicable to the distance between Darlington and York of a through rate for cattle conveyed not in the company's waggons from Aberdeen to London. All this was thoroughly understood by Mr. Robson and Mr. Oxlade, and there never has been any doubt or misapprehension on this point, although Mr. Oxlade or any one else has a right to raise the question whether under such circumstances the charges per ton per mile should be different or uniform. The statement of keeping back the accounts for three months is a mere fabrication. In July 1863 the company's rates, containing the quotation of 5*s.* 2*d.* with a drawback for waggons if provided by the colliery owner, was sent to Mr. Robson, and the accounts were sent in monthly according to the Company's practice, on dates varying from the 9th to the 14th of the month following that in which the coal had been carried, so that Mr. Oxlade's statements are untrue, and untrue within his employer's knowledge.

2ndly, Mr. Oxlade gives an account of an interview with Mr. Sherriff; this statement is no doubt altogether untrue, but I apprehend the Commission will prefer to hear Mr. Sherriff's own evidence on this subject.

3rdly, Mr. Oxlade, in answer to question 1906, makes statements respecting Mr. Spark and Mr. Tennant, the present accountant of the North-eastern Company, and I wish to read to the Commission Mr. Tennant's statement in reply: "Dear Sir, in Mr. Oxlade's "evidence given before the Royal Commissioners on "Railways, I observe an allusion is made to the Leeds "Northern Company, to Mr. Spark, and to the account-"tant of the North-eastern Railway. This occurs in "his answers to questions 1906 to 1909. As I was "formerly manager of the Leeds Northern and am "now accountant of the North-eastern Railway, the "reference is partly to me. There is a certain amount "of ambiguity in Mr. Oxlade's language, but there can "be no doubt as to his meaning. He evidently wished "to represent to the Royal Commissioners that Mr. "Spark was a friend of mine; that I was a partner "with Mr. Spark in the coal trade; that I had a "pecuniary interest in promoting Mr. Spark's business; "that I used my influence with a view to that end; "that Mr. Spark sent nearly all the coal on to the "Leeds Northern Railway, of which I was manager; "that Mr. Spark had a private agreement of a "beneficial character, and that as a result his (Mr. "Oxlade's) trade had been destroyed. As regards "all these allegations I can only say that I am pre-"pared to appear before the Royal Commissioners "and give any explanation which may be necessary; "but to save time I beg to authorize you to state "that Mr. Spark was a business acquaintance of "mine, and not a friend in the sense conveyed by "Mr. Oxlade; that I never was a partner with Mr. "Spark in the coal trade or any other trade; that I "never had any interest in his commercial transac-"tions; that Mr. Spark did not send nearly all the "coal on to the Leeds Northern Railway; that Mr. "Spark never had a private agreement with the "Leeds Northern Company, and that Mr. Oxlade "had not the slightest ground for the statements he "made in this part of his evidence. As regards Mr. "Oxlade's assertion that Mr. Spark sent nearly all "the coal on to the Leeds Northern line I beg to "remark that Mr. Oxlade had no means of knowing "the quantity of coal sent by Mr. Spark and by other "parties, either actually or relatively, and his state-"ment is entirely untrue. By way of explanation I "may add that the amalgamation of the Leeds "Northern line took place in 1853, and I have refered "to the accounts for the last month in 1852, and am "able to state that in that month the colliery owners "for whom Mr. Spark acted, six in number, sent 1,060 "tons of coal for sale at depôts out of a total quantity "of 7,801 tons sent by 31 coal owners for the same "purpose. With reference to Mr. Oxlade's answer" "to question 1,909, Mr. Spark never had a private "agreement with the Leeds Northern Company of "any kind, nor had he any agreement respecting "10,000 tons or any other quantity; probably Mr. "Oxlade meant to refer to certain arrangements "of the North-eastern Company, which however were "not private, but open to all coal owners on equal "terms. Those arrangements were made at a time "when the coke trade was in a depressed state, and the "company agreed that any coal owner who would send "a stipulated quantity into Staffordshire for manufac-"turing purposes should be charged at the rate of one

"halfpenny per ton per mile. Mr. Spark, amongst "others, entered into agreements of that character, "which he never failed to fulfil.—I remain, yours "truly, H. Tennant."

Then, 4thly, Mr. Oxlade, in his letter of the 14th March 1865, says that the carriage of coals is made the subject of a private agreement between the railway company and a few colliery owners. This statement is untrue, and untrue within Mr. Oxlade's own knowledge. There is no agreement made with the colliery owner beyond acquainting him with the rates, and such arrangements as may be necessary for sending waggons or engines to his colliery. The number of collieries sending coals on the North-eastern Railway is 232, and the quantity of coals they sent in 1865 was 11,062,611 tons.

5thly, Mr. Oxlade says in the same letter that under this private agreement a high rate for carriage is obtained and imposed upon the public. This also is untrue. The company quote their rates without reference to any agreement; whether those rates are higher than the company are empowered to charge is a question of law, and as it is one of those involved in the litigation carried on by Mr. Oxlade against the company, I will deal with it when I come to that question.

6thly, Mr. Oxlade states in the same letter that the railway company's agent has orders from the railway company when selling coals to obtain the money before he supplies the coals. This statement is untrue within Mr. Oxlade's own knowledge. The railway company gives no orders of any kind about selling the coals; these orders are issued to the company's agent at the depôts by the colliery owner without the cognizance or control of the railway company.

7thly, Mr. Oxlade says in the same letter that the public are not allowed to have any coals until they pay 40 per cent. per ton overcharge. I presume this refers to an overcharge in the rates, which I will deal with under its proper head.

8thly, Mr. Oxlade says in the same letter that the monopoly is completed by the places of deposit being let to favoured collieries. This assertion is untrue.

9thly, Mr. Oxlade states in the same letter that the owners of the favoured collieries divided with the railway company the unfair profits obtained by monopoly. This statement is altogether untrue, and is a pure fabrication.

10thly, Mr. Oxlade states in the same letter that the railway company allows the colliery owners, in consideration of their assistance, a long credit in the leading charges. This statement is also untrue.

In the 11th place, Mr Oxlade states in the same letter, that if any colliery owner refuses to assist in the unfair dealings, then the railway company stop his trade. This statement is untrue.

In the 12th place, Mr. Oxlade states, in his second letter of the 14th March 1865, that the North-eastern Company claim a right to pick and choose their customers and to centralize the traffic in coals into the hands of two or three agents. This statement is notoriously untrue, and untrue within Mr. Oxlade's own knowledge.

In the 13th place, Mr. Oxlade states in the same letter that the company are creating a gigantic monopoly, and compelling the public to pay from 2*s.* to 4*s.* per ton more for coals than the proper price. This statement is untrue, and I will deal with it in its proper place.

I now come to what the Commission will perhaps wish to hear. The charges against the North-eastern Railway Company appear to resolve themselves into three heads. First, whether there is any illegality in their charges, or in their regulations and practice. Secondly, whether, in consequence of their system, the price at which coals are sold to the public is higher than it would be under a different system. Thirdly, whether their arrangements are such as to preclude competition and create a monopoly.

Adverting to the first head, whether there is any illegality in their charges, regulations, and practice, I may state that about the year 1851 Mr. Oxlade was station-master at the company's Shincliffe station near Durham, but he subsequently left the company's service, and in 1853 was acting as agent for the West Belmont Colliery. At the same time and afterwards he commenced business as a coke and coal merchant. He had frequent disputes with the company's managers and officers, and eventually entered into litigation with the company. This litigation extended from July 1856 to January 1864, and embraced a great variety of points, both as to the charges made and the regulations and practice of the company. In the course of the litigation a very protracted investigation was made by a master under an order in the Court of Common Pleas into the whole of the company's system, and evidence was taken at very great length, so that the courts, in dealing with these questions, have had the fullest information before them. I am prepared to state in some detail the results of every action or application to the courts by Mr. Oxlade should the Commission desire it, but perhaps the Commission will not wish me to do more than state shortly the result.

12,062. (*Chairman.*) That will be sufficient?—Then I may state that he has brought six actions against the company, one in the Queen's Bench, three in the Court of Exchequer, and two in the Court of Common Pleas. In the first action, which was in the Exchequer, he was nonsuited and had to pay costs. The second action in the Common Pleas has been twice tried, resulting in a complete verdict for the company. In the third action, also in the Common Pleas, he was nonsuited, and appealed, but his appeal was dismissed, and against that he has appealed to the House of Lords. The fourth action in the Queen's Bench he has not prosecuted beyond issuing his writ. In the fifth action in the Court of Exchequer he was nonsuited, with leave to move the Court, who have suspended their judgment until the other appeal has been decided. And in the sixth action in the Exchequer he has not proceeded farther than to deliver declaration.

12,063. (*Capt. Galton.*) Has he not appealed from one of the decisions in the Court below to the House of Lords?—He has appealed to the House of Lords, and I apprehend that is an end of it. He also brought two cases against the company in the County Court, and in these he was nonsuited. Besides this he has made six applications to the Court of Common Pleas under the Railway and Canal Traffic Act. In the first, the one in which the long inquiry was made by the master, the rule contained six branches. The decision was in favour of the company on all points except one; this point referred to a state of things which had passed away, and to agreements which had expired, and the master had therefore not fully reported upon it. Mr. Justice Cresswell, in delivering judgment, said, that though the injunction would be fufile in consequence of the agreements having expired, yet as a matter of law Mr. Oxlade had a right to the injunction. The rule was therefore discharged with the exception of the injunction above described, and each party had to pay his own costs. In the second, fourth, and fifth applications to the Court of Common Pleas, the applications were refused without the company being called upon for an answer. In the third the application was refused on the company being heard against it; and in the sixth the rule was discharged with costs.

12,064. (*Chairman.*) I think Mr. Oxlade stated that the decisions of the different courts were conflicting, but, according to your account, he did not succeed in any instance, except partially on one point.—What I have stated to the Commission are the exact facts.

With regard to the second and third heads, the questions are so intimately connected with each other that I believe they cannot be properly discussed separately. And, in order to make my observations intelligible it becomes necessary for me to give a short explanation of the main principles on which the land-sale coal trade on this railway is conducted. The first of these arises out of the fact that the coals do not come upon the railway like other traffic at stations, but

Capt. W. O'Brien.

16 Feb. 1866.

must be dealt with at the pits, the access to which is over the colliery owners' private railways and sidings. The colliery owners, or their representatives at the colliery, alone regulate the admission of engines and waggons to their colliery sidings, the supply, detention, loading, and despatch of waggons, the qualities and quantities of the coals to be carried, and the persons and places to which they are to be sent; the company therefore make all the primary arrangements with the colliery owner exclusively. The second arises out of the fact that such coals cannot, without excessive and useless expense, be at once removed from the railway to the premises of the consignee; and the magnitude of the trade is such that, without the most careful arrangements as to this, the sidings, and even the running lines would be blocked up, and the whole traffic of the line stopped. To avoid this difficulty the company have purchased extra land at their stations, and on this have built depôts or cells—in fact, warehouses, in which the coals are stored;—these warehouses are let or appropriated to various coal owners for particular kinds of coals. The number of these depôts at any particular station depends upon the amount of coal sales at that place. There is no obligation on a railway company to provide or continue these coal warehouses; it is a special service voluntarily undertaken for the convenience of the trade, and the consequent benefit of the public. Other companies have adopted the same principle, and provided ground on which the coals are stacked. The North-eastern system, though more costly, is very superior to this, inasmuch as under it there is a saving of labour, and a larger amount and many more sorts of coals can be stored on the same area. The public have free access to these places of deposit, and select from them any kind and quantity of coal they please. The third principle springs out of this establishment of a retail trade in coals upon the company's premises. It would be impossible, on account of the expense, for each colliery owner to appoint his own salesman, and in many cases the sales of all the coals at one place are not sufficient to occupy even one man. Moreover, if the sales get into the hands of one agent, without any special responsibility, he would become in fact a middleman, or dealer in coals, with a monopoly of the trade and power to take full advantage of such a position. The company have therefore endeavoured to obviate this difficulty by appointing, at a fixed salary, and at their own cost, a depôt agent at each coal station. This man is the servant of the railway company alone, but his duties are to communicate between the public and the colliery owner, to send orders to the colliery, to supply coals as may be required by individuals, or for the keeping the depôts stocked, to weigh, by means of machines provided and maintained by the company, the coals that are sold, to sell the coals, to receive the money and pay it to the colliery owner or his agent, and to keep the sale accounts. And in order that the coal owner may superintend effectually all these operations at the least possible expense, he receives a cheap ticket over the railway for himself or his servant or agent. This service is also a special one, not obligatory upon the company, but voluntarily undertaken by them for the convenience of the trade and the benefit of the public. The selling price of the coals is fixed by the colliery owner exclusively, without the interference or control of the railway company. The name and price of the coals are placed over each depôt, and the depôt agent gives with every lot of coals sold a sale-note stating the kind, the price, and the weight, so that the purchaser has the intervention of a salaried officer of the railway company, who has no personal interest in the sale of any particular kind of coal, to protect him against the impositions which in the retail coal trade are so frequently practised in these matters. The charges made by the company for the special services mentioned vary from 1*s.* 3*d.* to 3*d.* per ton, in some special cases the charge may amount to 1*s.* 6*d.* per ton, and in many cases where the traffic will not bear it, no charge whatever is made. The charge made to the colliery owner includes both the ordinary railway dues and the special terminal services and accommodation. The cost to the company of these services and accommodation cannot be stated accurately, partly from the extreme variation in the cost of providing the accommodation, and partly because this cost is a fixed expense and has to be apportioned over a fluctuating number of tons. It has been roughly estimated at 1*s.* 6*d.* per ton, though no individual would venture to provide it at such a rate. But if it were transferred from the railway company to any other body, there would be an immediate and serious rise in the price, and the safeguards for the proper conduct of the trade would be lost. I have a table here, which will show the effect of the system in providing against monopoly.

The following Table was handed in:

Coal Cells, Coal Sales, &c. at Malton, Pickering, Richmond, Thirsk, and York.

Station.	Population of Borough.	Number of Coal Depôts.	Tons sold in 1865.	Average Sales per Cell.	Number of Collieries sending.	Number of Sorts of Coal sold.	Number of different Coal Fields from whence supplied.
Malton -	8,072	20	15,419	771	46	83	3
Pickering -	4,501	17	11,162	656	25	36	2
Richmond -	5,134	23	13,196	573	29	35	2
Thirsk -	5,350	17	4,928	290	27	39	2
York - -	45,385	42	53,066	1,263	62	117	3
	68,442	119	97,771	3,553	189	310	
Average -	13,688	24	19,554	821	38	62	

Taking the average of five stations of different sizes and in different districts, it will be seen that the public have always had a large stock of coals to choose from, that they have had 62 different sorts of coals, supplied from different coal fields, and sent by 38 different collieries, all competing, or with full power of competing with each other. The numbers of depôts at any station is limited, if not by the extent of ground which the company possesses, at all events by the extent of the trade, but the number of collieries in the Durham and Yorkshire fields from which coals are actually sent upon the North-eastern Railway is 232, and the number of those from which coals might be sent is of course very much greater, so that some selection is a physical necessity. The directors therefore allot the depôts to the best of their judgment. The interest of the company is solely in the quantity of coals carried, and the weight of coals sold forms the chief criterion, according to which depôts are from time to time allotted or resumed. Where however collieries compete, a coal owner can only increase his sales, and consequently his claim to an increased number of depôts, by a reduction in price, or an improvement of quality, or both, so that in this important point of allotment of depôts, which is often held up as giving the railway company an injurious monopoly of the trade, the interest of the railway company is to encourage competition, and is absolutely identical with that of the public, while for the same reason it is somewhat antagonistic to that of the colliery owner or coal merchant.

The advantages of the system established by the North-eastern Company may be summarized as follows:—First, it renders unnecessary the employment of dealers' middlemen, and agents, whose profit is a material addition to the price paid by the consumer. Secondly, it stimulates competition by the system of allotting depôts, by changing the allotment according to sales, by bringing different coal fields, and different collieries from the same coal field, into competition at one spot, and by enabling a colliery with a limited trade to compete with a large colliery on equal terms. The Commission have before them an instance where the coal trade of the town of Nottingham has been, in consequence of the crowding, confusion, and difficulty of getting to the waggons, placed in the hands of nine persons. The competition at Nottingham, a town of

74,693 inhabitants, is therefore limited to those nine coal merchants. Under the North-eastern system the city of York, with a population of 45,385, has the advantage of a competition of 62 different collieries; and taking the average of the five towns previously mentioned, a town population of 13,688 persons are supplied by 38 different collieries. Thirdly, it provides at every depôt the constant attendance, at all hours, of one well known agent, answerable for any neglect to the directors of the railway company, and whose duty it is to communicate with the colliery owners as to the complaints and wishes of the public, and also with the railway company, whenever their interference may be desirable. Fourthly, it gives the public the free choice at all times of a large stock of various kinds of coals always on hand, and the poorest person buying a single cwt. receives as much attention, and can buy the same coals and at the same price, as any other person who goes to the depôts. Fifthly, it gives the best attainable security against imposition, as to the kind, the weight, and the price of the coals. Sixthly, it enables the trade to be carried on with the utmost economy, there being only one agent, and one set of storehouses at each place. This advantage is more especially noticeable at the small stations, where the business is not large enough to support even one agent. Seventhly, it greatly simplifies the operations of the trade, for when once the colliery owner has arranged with the company the depôts to which his coals are to be sent, and received a list of the dues, the trade may be begun without any further trouble or expense on his part. The companies send the empty waggons to the colliery, lead the coals to their destination, keep the depôts properly stocked, sell the coals at the price he fixes, keep the sale accounts, and remit the proceeds. If, on the other hand, he wishes to push his sales, he may engage, at his own expense, any number of local agents or canvassers, he may have a cheap ticket over the whole railway for himself or for a superior servant or agent to superintend his trade. He instructs the depôt agent directly, without any reference to the railway company, as to the price at which his coals are to be sold, and whether for cash, or that credit shall be given to any particular person, and to what extent, or that he himself will make out the customers' account and collect the money. In fact he arranges all this part of his business precisely as he pleases. Eighthly, it enables the public to buy coals at the lowest attainable price; this price is necessarily composed of two elements, and by the North-eastern system it is confined to those two; one, the lowest price which the coal owner, acted on by the influence of competition, will take for his coals delivered into waggons at the pit mouth; the other, the railway dues, including the charge for sale expenses, which is on the whole below the actual cost. It is an essential feature of the system that it enables the colliery owner, if so disposed, to dispense with the employment of any intermediate trader between himself and the public. This is naturally objected to by all such intermediate agents, and by that portion of the public who are acted upon by their influence, and take their opinions from them. The profits of the intermediate trader are generally understood to amount to from 2*s.* to 2*s.* 6*d.* per ton, but whatever they amount to they are an addition to the pit price charged by the colliery owner, and therefore an addition to the price paid by the consumer.

It has been asserted in public, when discussions have taken place on this subject, that the selling price of coals in the district traversed by the the North-eastern Railway has of late years been materially increased, and the assertion is true. It has also been said that this increase has been caused by the system pursued by the company, and by their having increased their charges. This idea has arisen, not unnaturally, from the public being accustomed to buy their coals from a depôt agent, whom they knew to be a servant of the railway company. When they see a railway servant selling coals, taking money, sending in accounts, receiving orders and managing this trade as he would do the merchandise or passenger business, it is impossible to disabuse their minds of the idea that he acts with regard to the price of coals as much under the orders of the directors as with regard to the fares of passengers, and that any increase in either is the act of the railway company. This belief is also fostered by the assertions of unscrupulous or ill-informed persons. It is, however, as I have explained, altogether erroneous. The railway rates on coals were revised about 12 years ago; at that time some rates were slightly increased, but on the whole there was a reduction. Since then no change has been made, except some reductions in particular cases, and a material and extensive reduction in 1863. In the Yorkshire district, where there is every kind of competition by rail and by water, the price of coals was raised between 1853 and 1861, according to the recorded resolutions of the Coal Trade Association, 3*s.* 5*d.* per ton. The actual increase was, however, greater, and in some cases the reduction made in the railway charges was added to the price at the pit, the coal owner intercepting for himself the reduction that was intended to lower the price paid by the consumer. In the Durham coal field an increase has taken place in the pit price (by which expression is meant the residue of the selling price of the coals sold at the depôts after deducting the railway charges, and which is taken by the coal owner) of from 3*s.* to 5*s.* per ton. The coal owners justify this on the ground of the increase in the cost of labour and materials, and claim the right which all traders have of selling their wares at the best price they can obtain. Small variations in the railway dues do not appear to influence the selling price of coals. In cases where the railway company advanced their dues 3*d.* per ton, the coal owner raised his pit price 4*s.* 3*d.* per ton; and in another case, while the railway company reduced their dues 10¾*d.*, the coal owner raised his price not only 5*s.*, which would probably have happened at any rate, but 5*s.* 10¾*d.* The fluctuations in the selling prices of coals as fixed by coal owners may be illustrated by Mr. Oxlade's own practice. In 1853 and 1854 he was, as the railway company supposed, agent for and representing the proprietors of the West Belmont Colliery, or, as he has since declared, owner of the West Belmont coals. Whatever his position was, he was the person who fixed the price at which these coals were sold at the York depôts. The fluctuations of price are shown in a table I will hand in, the railway dues being 5*s.* per ton, and remaining unaltered.

The following table was handed in:

Date.	Selling Price of West Belmont Coals at York, fixed by Mr. Oxlade, and paid by the public.	Railway Dues.	Balance, after defraying the Railway Charges, paid to the West Belmont Proprietors, and received by Mr. Oxlade himself, if a principal, or by his employers if only their agent.
1853.	*s.* *d.*	*s.*	*s.* *d.*
October -	12 6	5	7 6
,,	15 6	5	10 6
November-	15 6	5	10 6

December-	21 0	5	16 0
,,	18 0	5	13 0
1854.			
January -	18 0	5	13 0
February -	15 6	5	10 6
March -	14 6	5	9 6
April -	14 6	5	9 6

The selling price was subsequently reduced to 13*s.* 6*d.*, and is now 14*s.* It is due to Mr. Oxlade to mention that he published a letter denying in the strongest terms the truth of these statements as to the selling prices of his coals at York. The figures, however, are taken from the depôt agents' sales books, and the original instructions from Mr. Oxlade in five of the cases

Capt. W. O'Brien.

16 Feb. 1866.

named, including the highest and lowest prices, happen to have been preserved, and I now produce them to the Commission. (*Handing in the same.*)

12,065. (*Capt. Galton.*) Do the railway dues vary at each station, or are the railway dues at Ripon or Darlington the same as they are at York?—No.

12,066. They are made up partly, I presume, of the 1*s.* 6*d.* which you say is charged for the services rendered, and the charge for the conveyance of the coal?—Yes; they vary between every colliery, and every station.

12,067. At Thirsk, for example, they would be lower than at York?—Yes.

12,068. And lower than at any station north of York?—No. I think at York the charge is lower than at some of the stations north of York; for there we come into competition, not with other lines, but with water competition.

12,069. May any colliery owner or colliery proprietor send coals on to your line if he chooses; could he send them to any station, or would you you select it for him?—No. If there is room at any depôt he would get a depôt allotted to him at any particular place that he applied for; but if there is not room he must wait until some other person is turned out for not selling a sufficiently large quantity, and in that case he would have the depôt of the person turned out.

12,070. What rules are laid down by the North-eastern Company with regard to turning people out?—Our system is to revise the appropriations from time to time, half-yearly or yearly, as the case may be; and if we find that there is somebody who has got a depôt but sells very few coals, then we give him notice that he must go; we turn him out, and we put in some other colliery owner whose coals we think will command a greater sale.

12,071. Suppose a person wishes to sell coals in a particular town, do you not allow him to have a depôt?—He may sell any coals in any town that he likes.

12,072. But may he receive them by railway and take them to his depôt?—They must be passed through our depôts.

12,073. Suppose a person wished to send only three or four waggons, would you refuse them?—No. For instance, if a gentlemen wanted a particular kind of coal that did not happen to be in stock, we should say, we will send a waggon for you to bring the coal, and we should charge an extra price for it—a shilling a ton.

12,074. But you would allow no dealer to do that?—No, unless there was a considerable quantity of the coals required. If he could show that there was any probability of that quantity being required, we should be glad to give him a depôt for them.

12,075. (*Mr. Glyn.*) Do you lay down a certain minimum quantity that the dealer must pass through the depôt?—No, that varies at every station; but the revision that takes place brings all that out.

12,076. Upon what principle is that revision made?—The principle is that whoever sells very little must be turned out, so that somebody else who can show some good reason why he will be able to sell more may be put in.

12,077. Suppose that a man makes but few sales in 1864, for example; in 1865 he might be more successful with another colliery, would you turn him out because of the little business he had done in 1864?—We should look to what he had done in the year 1864, and if he had only sold during six months 30 or 40 tons, we should say he should make room for some one else. Sometimes, however, a man may say, "I have had a strike at my pits," and then that circumstance would be taken into consideration.

12,078. (*Lord Stanley.*) Would you not require him to prove that?—We should know that as well as he did.

12,079. (*Mr. Glyn.*) But suppose he became connected with a new colliery, would you not try him a little longer?—Then the new colliery would be on the same footing as a number of other collieries, the proprietors of which might be applying for that particular cell.

12,080. In the meantime he might have lost his depôt that he had in 1864, and if he began to work a fresh in 1865, he would still want a depôt?—Your idea is, I think, that in 1865 he begins with a new colliery, and, as I have said, he would then be in the same position as 20 other persons who had either had new or old collieries, but had not been selling coals at that station. We must choose some one, and we say to these parties, "will you guarantee a certain quan-"tity; if you will guarantee a large quantity, we "will turn anybody out who is doing but little to put "you in." If they do not guarantee anything, but simply say that their coals are very good, they are then in the same position as 20 others.

12,081. Then your proceedings are entirely regulated by the quantity they dispose of?—Entirely.

12,082. (*Chairman.*) Are your depôts usually fully occupied?—At most of the stations they are, but we have a certain number of stations where the depôts were built very much in excess of what was wanted; the trade perhaps has left that part of the country, and in such cases we have more cells than any persons there would be likely to ask for.

12,083. (*Capt. Galton.*) What is the smallest number of colliery proprietors you allow at any one station?—There are some of the minor stations where we have not more than three depôts, and there we should put in three colliery proprietors, or perhaps only two.

12,084. (*Chairman.*) Have you depôts at every station, however small they are?—We have at almost every station.

12,085. At all the important stations are there usually many applications from other colliery proprietors asking to be admitted as opportunities may offer?—Yes.

12,086. (*Capt. Galton.*) Practically you do regulate the whole of the coal trade over the whole district?—Yes, in the way I have explained.

12,087. (*Chairman.*) Are the colliery owners generally speaking satisfied with this arrangement?—The colliery owners are satisfied, but the agents and middlemen are dissatisfied, because it is their destruction.

12,088. (*Capt. Galton.*) Are the consumers of the coal satisfied—the proprietors of factories and other establishments, where large quantities are consumed?—Yes, we never have any complaints from them, but then there is a very large portion of the public who take their opinions from the coal merchants, and they know nothing about the system. I have no doubt that hundreds of persons will be found to say that it is a very bad system.

12,089. The coal merchants however still exist?—Yes, they exist in spite of us.

12,090. How do they obtain their coals; I believe there is no water communication in a great part of your district?—Yes, there is a great deal of water communication in the south of Yorkshire, and it is a very curious thing, but coal agents will live, and they will sell coals at a price that leaves them a large profit when equally good coals at a low price will not sell.

12,091. (*Lord Stanley.*) How do you account for that?—Because the public are led, not by their own judgment in coals, but by the hard unscrupulous assertions of the coal dealer that he sells the best coals.

12,092. (*Earl of Belmore.*) How do these coal dealers obtain their coals, if you do not convey them for them?—It is done under the name of the coal owners.

12,093. So that in fact you do convey them to the coal dealers, although nominally they are conveyed to some one else?—Yes. If the coal dealer makes an arrangement with the coal owner, we do not interfere with that.

12,094. (*Mr. Glyn.*) The depôt is paid for in the way?—Yes.

12,095. Have you ever had any charges of favouritism brought against your agents at the stations?—Yes, constantly.

12,096. Have you ever on any occasion found that those charges were really well founded, and that any

serious inconvenience has been caused to the neighbourhood?—No. These charges usually take this shape: The colliery owner says, "The man at the "depôt gives a bad name to my coals, but he gives a "good one to the coals of somebody else,"—and he takes for granted that the agent gets some consideration for it. All I have to say about that is, that if any man is caught in such a practice, he is turned off instantly; and in one instance I may state that the directors turned off one man who had been there for a long time, on a question of 9*d.*

12,097. Have you found it necessary to dismiss men in many cases?—No.

12,098. Of course, if these charges are brought, you investigate them?—Yes, we investigate them; but they are very difficult matters to investigate when it is the interest of the briber and the bribed to conceal the transaction; and indeed I do not know how you are to get at it. As I have said, accident has brought out a case or two, and the directors are so rigid, that on a question of 9*d.* they dismissed a man immediately. They make this rule to let the depôt agents know what the consequences of misconduct may be.

12,099. (*Capt. Galton.*) Is not your system open to the charge of being liable to favouritism?—Yes; but less so I think than any other conceivable system.

12,100. Not less so than if the whole thing was open?—Much less so, I think.

12,101. Might it not be urged that you selected some colliery owners, and excluded others from motives of favouritism?—Yes; quite so; but that would be a charge of favouritism against the directors for selecting particular collieries. I thought you meant favouritism on the part of the depôt agent. It certainly is open to that charge, and I should say that every conceivable system must be open to it, because ultimately you cannot bring 500 different colliery owners together at one place to sell their coals.

12,102. No; but suppose the matter was left entirely in the hands of local agents to order from the colliery proprietors what coal they required, would they not then just order what would meet the demand without the intervention of the railway companies?—No; say that there were 232 collieries, each colliery owner through his agent would receive an order for coals, and we should have perhaps at a small station hundreds of waggons sent, every man knowing that whoever got in first, his coals must be sold before the others could be got to the station, and the line would be stopped instantly, the very first day it was attempted.

12,103. (*Mr. Glyn.*) Under such circumstances you could not arrange the traffic?—No; and even now with all our care on some occasions we found that rather too many coals were sent, and they were left to stand on the main line because they had no other place to put them in.

12,104. (*Capt. Galton.*) You were driven into this system, then, by necessity from being unable to accommodate a larger amount of coal traffic?—Yes, by the physical necessity—want of space at the depôts.

12,105. In what way does your system differ from the system that is pursued at Nottingham?—The case at Nottingham I have described; the difference there was as to the ground that was set apart on which the coals were stacked. At York ground was set apart on which depôts were built. At Nottingham they could only accommodate nine people, and at York we accommodated 62.

12,106. (*Mr. Glyn.*) The one town having a population of how many?—The population of Nottingham is 75,000, and that of York 45,000.

12,107. (*Capt. Galton.*) The reason is, I presume, because you appoint an agent who sells the coals for those people, and who limits the quantity which comes in at any one time to what is actually wanted?—Not exactly that; the difference between the two is that on the same area you can stow a far greater quantity and a far greater number of sorts of coals by using those extensive depôts than by merely stacking the coals on the ground.

12,108. Your coal vans, I suppose, are raised up, and they drop the coals down below into the cells?—Yes; quite so. It saves labour. They are drawn up the incline, below which are the cells; the bottom part of the van is opened, and the coal drops down into the cells without labour or expense, and when the train is empty it is taken away back, whereas in the stacking system, of course, every piece of coal must be carried away and put into its separate stack, which is a very costly matter.

12,109. According to your system the cost of unloading is very much lessened, and you are able to afford very much larger competition for the town than is afforded under the Nottingham system?—Quite so.

12,110. (*Chairman.*) Have any of the other railway companies adopted the system of the North-eastern Railway Company?—Not to such an extent; it is partially adopted, and I believe has been copied from us.

12,111. Have you introduced it on lines that you have lately acquired?—Everywhere.

12,112. On the Newcastle and Carlisle?—There it was introduced before we got the line, but on our new lines and on our new branches we build coal depôts as systematically as we build passenger stations.

12,113. (*Mr. Glyn.*) In point of fact you do that as a question of economy, do you not?—I am not so sure about that; they are very expensive things, but we look at the thing in the long run. One great point is that the trade shall be carried on economically, and if the trade is a flourishing trade we look to that to pay us rather than to any immediate profit out of the cells.

12,114. (*Chairman.*) In the southern portions of your system does coal come in from districts which are not traversed by your railway?—Yes;

12,115. And do you adopt the same principle in those cases?—Yes; just the same. I may say also that we have depôts at the southern end of our system which it would be our immediate pecuniary interest to feed with coals from the Durham district, and so keep out the Yorkshire coals; but we distinctly set aside that which might be called the commercial principle. We bring coals from any district, whether the immediate run on our own lines is long or short, our object being nothing but competition. We are quite sure that if for instance Yorkshire coals are sent through to the York station, then the Durham coal owners must by the force of competition be compelled to come down and we get a lower charge for the public, and in the long run that is more to our interest than encouraging any one particular trade.

12,116. (*Capt. Galton.*) It of course encourages more consumption?—Yes; it encourages more consumption.

12,117. (*Chairman.*) You do not adopt the same principle with respect to the coal trade as with respect to the general trade; that is to say you do not carry from all collieries at equal rates, whatever their distance from the station may be?—No; but we do adjust the rates so as to bring the coal from the different collieries as much as we can into competition.

12,118. Do you carry coals 100 miles at the same rate at which you would carry it 60 miles?—Yes; I dare say we may do so in some cases.

12,119. In each instance you determine according to the circumstances of the case?—Yes; and we attempt by that adjustment of our rates to get the greatest possible competition at any one place between coal fields or between collieries from the same coal field.

12,120. (*Capt. Galton.*) Would you charge nearly equal rates on the southern part of your line for coal coming from Durham as if it came from Yorkshire?—Approaching equal rates, but the margin of profit to the coal owners is so large that it is not in the least necessary to go to actually the same rate as it is in merchandise.

12,121. What is the cost of getting up a ton of coals at the pit?—It would vary with every pit.

Capt. W. O'Brien.

16 Feb. 1866.

12,122. When the sale at York is 16*s.* a ton and you charge only 5*s.*, they get it very considerably under 10*s.* a ton at most of the pits, do they not?—They make a very large profit on it; the coal trade is very flourishing, there is no doubt about that.

12,123. (*Chairman.*) With regard to Mr. Wooler's evidence, what observations have you to make?—With regard to Mr. Wooler's evidence which is contained between questions 9567 and 9677, that evidence affects the Stockton and Darlington section of the North-eastern Railway, and I do not refer to that, as it will be replied to by the secretary of that section.

12,124. That line is now amalgamated with your line, is it not?—It is now amalgamated with our line; but it was not amalgamated at the time that those circumstances took place.

12,125. Mr. Wooler's evidence refers to circumstances which took place before the amalgamation?—Yes. I may also say that Mr. Wooler stated to the Commission that he represented the Darlington Chamber of Commerce. I have a letter here from the chairman of the Chamber of Commerce saying that the evidence which Mr. Wooler tendered to the Railway Commission was his own voluntary act, that he was not authorized or even requested to give evidence on behalf of the Darlington Chamber of Commerce.*

12,126. He says, I have come here as representing the Chamber of Commerce of Darlington?—Yes; he states so.

12,127. (*Capt. Galton.*) Before proceeding with the case of Mr. Wooler, let me ask you did not the North-eastern Company contend in their law proceedings with Mr. Oxlade that they were not bound to carry coal if they did not choose?—The contention was that they were not technically common carriers, but that they were special carriers.

12,128. And that they were perfectly entitled to refuse to carry coal if they chose?—That turns upon the precise question in the case. They are not common carriers, but I say they are special carriers, and that arises from the necessity of dealing with the coal owners.

12,129. Did they contend that they might refuse to carry coal if it was tendered to them?—That they might refuse to carry coal for a particular person, and the difference is this, that in the case of goods they are tendered to us at a station where we are common carriers; but in the case of coals we must go to a man's private property, that is to say, to the pit, and nobody can deal at the pit without arrangements with the owner of the property.

12,130. Suppose they brought their coal down to the side of your line, would you contend that you were not bound to take it on?—No; we should not contend that. That question arises when another company, for instance, tenders coal or anything of that kind.

12,131. If a colliery proprietor had an engine of his own to run on his own branch line, he would then tender it to you at the side of your line, and would you not be bound to take it on?—Such a case never has arisen, but it would arise in connexion with the original construction of the siding.

12,132. But in such cases should you consider that you were bound to take the coal?—Yes.

12,133. I apprehend that a person has a right, if he is the owner of the land, to construct a siding by the side of the railway, and under the Railways Clauses Consolidation Act to make a junction with the railway, subject to the railway company's engineer's approval?—As I understand, any landowner has a right to make a siding on his land, but that is not the question which arises; we must settle first how the coal is to be got on to the railway, which is a matter of special arrangement with some coal owner, and the next question is, how the coal is to be got off the railway at the other end, and you cannot carry on the coal trade at all unless those two questions are first settled.

12,134. Therefore you contend that you are not bound to take the coal of any particular coal owner?—Hardly so; the contention has been that we are not bound to take the coal of coal merchants.

12,135. (*Mr. Glyn.*) Was that view admitted by the court?—Yes, all the courts agreed in that; there is no question about it as a matter of law.

12,136. (*Chairman.*) Are there any considerable number of coal owners in Durham and that quarter who are not able to get their coals on to your railway at all?—A large number.

12,137. Who are desirous to get their coals on to the railway and who cannot do it?—No, I do not think that there are many who are desirous of doing that who do not do it. We have 232 collieries sending coals on our line, which is a very large number, but there are many hundreds of other collieries.

12,138. (*Capt. Galton.*) Do any colliery proprietors complain of undue preference being shown to one colliery proprietor over another?—Yes; every one who has not a depôt complains that he is ill treated, and he would like somebody else to be turned out and himself put in. Our answer invariably is, "Give us a reason for "turning out any coal and we will turn it out, but we "will not exercise the favouritism of turning out one "man's coal merely because another man would like "to have his coal in instead."

12,139. Still, a certain amount of selection must have been exercised originally, not perhaps from favouritism, but I presume from some special circumstances?—When we speak of originally, we are speaking of what occurred 25 years ago.

12,140. Has the practice existed ever since the formation of the line?—Yes. I should have explained that this system was originally established on the Stockton and Darlington Railway, the first coal railway, where many of the directors were coal owners themselves, and where coal was a great business. They adopted the depôt system with an agent under the company as the best means of removing difficulties and fostering the trade, and of getting rid, as far as they could get rid, of favouritism. That system has forced its way steadily on from the Stockton and Darlington line to one part of the North-eastern system, and then to another part of the North-eastern system, and finally to the whole of the North-eastern system,

12,141. Are the directors of the North-eastern railway coal proprietors also?—Some of them are.

12,142. And some have depôts?—Yes.

12,143. And some have not?—I should think that all the colliery proprietors that we have, being owners of great leading collieries, are sure to have depôts more or less, still they complain like others that they cannot get depôts enough.

12,144. (*Mr. Glyn.*) I suppose that if they failed in delivering the quantity they would be turned out the same as others?—Just the same.

12,145. (*Capt. Galton.*) So that the system has grown up with the railway?—The system has grown up with the railway and has been forced on by experience. I may say also that when the system was questioned, as it was very much, the directors invited all the colliery owners to come to them and to suggest what improvement could be made, but the colliery owners were so entirely satisfied that only one colliery owner came, and that was merely to see what was going on. The people who attended the meeting were the coal merchants, all of whom were dissatisfied, and their dissatisfaction we hold to be a conclusive proof of the benefit of our system.

12,146. (*Chairman.*) Besides the coal which you supply to your own stations, you send a good deal of coal and coke out of the district, do you not?—Yes, large quantities.

12,147. Do you allow any coal owner to send coal in that way?—Yes.

12,148. Anyone that applies to you?—Anyone that applies to us.

12,149. (*Capt. Galton.*) The collieries could not exist if you did not allow them to send coal?—There are two classes. Many coal owners do not trouble

* See question 12,152.

themselves about the land-sale trade; many of them have a local land-sale trade in coals, and many others have a great shipping trade.

12,150. Still the shipping trade is conducted by railway?—Yes.

12,151. No colliery could exist from which coals did not go by rail?—Yes, that is so, but the system which I am speaking of does not apply to shipping, because there you get the second great principle at work, namely, that the coal is got rid of the instant it is got to the terminus.

12,152. (*Chairman.*) I think you stated that Mr. Wooler did not represent the Chamber of Commerce?—I will read a letter which I received from the chairman of the Chamber of Commerce. "Pierremont, "Darlington, 15th February 1866. Dear Sir.—The "evidence which Mr. Wooler tendered to the Railway "Commission was his own voluntary act; he was not "authorized or even requested to give evidence on "behalf of the Chamber of Commerce here. I am, "respectfully, Henry Pease, Chairman, to Captain "W. O'Brien."*—One allegation of Mr. Wooler is with regard to passenger fares. Mr. Wooler complains on the part of the Darlington Chamber of Commerce, that the company's passenger fares in the Newcastle district are high. The tables which the Darlington Chamber of Commerce submitted to the Commission in proof of this complaint will probably be considered its sufficient refutation. They show that the first-class fares vary from $2\frac{1}{2}d.$ to $\frac{3}{4}d.$ per mile, and the second class from $2d.$ to $\frac{1}{2}d.$, and the third from $1\frac{1}{4}d.$ to $\frac{1}{3}d.$, and the government fares from $1d.$ to $\frac{1}{3}d.$ He also complains that they are irregular, that is, not uniform per mile irrespective of circumstances. The directors considered this an advantage to the public as well as to the company. Any attempt to coerce railway companies into the adoption of the principle of compulsory uniformity of charge per mile will displace the parliamentary security on which railway companies have expended their capital, or will diminish the facilities now voluntarily given to the public, and if it were to take a practical shape, would probably combine both. I presume the Commission would not wish me to take up their time with any further remarks upon this point. He also complains that, dividing a fare at Pelaw, the sum of the two divisions is less than the total fare, which is correct. The line between Newcastle and Pelaw is common to the ordinary through train service between Newcastle and Darlington, and to the cheap train service between Newcastle, Shields, and Sunderland. The fares between Newcastle aad Pelaw are regulated by the scale applicable to the latter service, and those between Newcastle and Darlington by that applicable to the former, so that the difference referred to is merely a repetition in another form of the statement that the charges are not uniform per mile.

12,153. Where you have those very low fares, is the population very large?—Yes; there is the large population of Newcastle, the large population of Shields, and the large population of Sunderland, all within a moderate distance, and there we think that low fares are the best for us and for the public.

12,154. Are you of opinion that the railway derives an advantage in those cases from the low fares?—I am.

12,155. Are you of opinion that it would not be an advantage to lower the fares on the line generally to that scale?—Not to that extent; we are lowering the fares on the line generally, but not to that extent.

12,156. (*Mr. Gower.*) When you have lowered the fares, have you found that a loss has resulted to the company?—It is very difficult to give a clear answer to that question. In all instances that I know of we did lose at first. Whether ultimately we have not profited by it is quite another point, and does not admit of a positive answer.

12,157. (*Capt. Galton.*) Has the increase of the traffic been large where you have not reduced the fares?—The increase of traffic is moderate everywhere. No experiment has been made with sufficient accuracy to enable anybody to speak very positively upon that point.

12,158. Do you give great third-class accommodation upon your line?—Yes.

12,159. Was not there a complaint that you ran no parliamentary train from Penrith to Darlington?—That referred to the Stockton and Darlington section.

12,160. It was after you had obtained it, I think?—I dare say it was, but that section is under its own special management, and I cannot answer positively with regard to it.

12,161. Do they run a parliamentary train now?—They do.

12,162. For some time they refused to run it, did they not?—I think they did. There was some correspondence with the Board of Trade about it, and I think they ultimately agreed to run parliamentary trains.

12,163. (*Mr. Glyn.*) Is the Stockton and Darlington section governed and represented by its own board? Yes. There is a special clause in the Act of Parliament which provides that the management of the Stockton and Darlington section shall be continued under a separate committee, who in certain things, that is to say, in the general management of the railway, have the same powers as the board of a separate company.

12,164. It is worked by the North-eastern Company, is it not?—No; it is worked by itself, but it forms a part of the North-eastern line, and the money is divided without reference to where it is earned.

12,165. But all the receipts go into the coffers of the North-eastern Company?—Yes, into a common purse.

12,166. Are the two companies' stocks amalgamated?—No. The Stockton and Darlington is a section of the North-eastern Railway, but they take their dividend on the same principle as many other sections do, namely, a per-centage out of the total net profit.

12,167. Is it a guaranteed dividend?—No.

12,168. Then it varies according to your own rate of profit?—In each case it varies according to our own rate of profit; their preferential stock is secured under the powers of the Stockton and Darlington section.

12,169. And do you find the working plant?—They had their own working power, and it suits them to have it still.

12,170. Is it turned over to you?—No; they keep their own management of the line,

12,171. In fact the management is entirely in their own hands?—Entirely.

12,172. Do they fix their own rates?—Yes.

12,173. (*Chairman.*) Has that arrangement been found to work well?—The two boards do agree exceedingly well, and the arrangement works very well. Whether it would be a good arrangement under other circumstances is of course a different question.

12,174. (*Earl of Belmore.*) With regard to the reduction of passenger fares which you spoke of just

---

* The following letter had been received by the Secretary in answer to the Circular (Appendix H), sent to the Chamber of Commerce, Darlington:—

Chamber of Commerce, Darlington,
May 17th, 1865.

W. Pole, Esq.,

Sir, *Royal Commission on Railways.*

Referring to your Circular of 5th April last, I have pleasure in informing you that Mr. W. A. Wooler, of Sadberge Hall, in Darlington, will be glad to come before the above Commission.

The evidence he wishes to give will have reference principally to the high rates charged on the North-eastern Railway, the difference of such charges, and inequality of treatment under similar circumstances by the same company in different cases.

If you wish for further particulars I shall be glad to furnish them on receiving instructions from you as to the shape you would like them in; also please say when it will be necessary for Mr. Wooler to be in town.

I am, &c.

Secretary, (Signed) R. F. Laidler,
Royal Commission on Railways, Secretary.
House of Lords,
Westminster, S.W.

Capt. W. O'Brien.

16 Feb. 1866.

now, was it a reduction to any great extent?—It is going on now.

12,175. I mean was it to any great extent in the way of per-centage?—It will be to a very large extent by the time it is finished. We are taking three years to do it; but it involves a very large amount of money.

12,176. Are you reducing your passenger fares gradually so much per cent. one year and so much another?—We told our proprietors that we were going to do it largely, but that the loss might be so serious that we must spread it over at least three years; and during those three years we are reducing the fares in various ways so that it may work out about that time.

12,177. In your opinion would a general reduction of fares to any great extent be profitable, or the reverse, to the railway company?—My own opinion is that a general reduction of that kind is a loss; but there are many cases depending upon particular towns where I think a reduction often is a distinct gain. In excursion trains and things of that kind I think low fares are the best; but a general reduction of first-class and second-class fares I think must be attended with considerable loss to the railway company.

12,178. (*Capt. Galton.*) Do you believe that a reduction of the third-class fares would be attended with great loss to the company?—Yes.

12,179. Considering that the amount of third-class traffic would be increased?—It would be increased at the expense of the second-class.

12,180. You do not consider that any great increase of *bonâ fide* third-class traffic would result from increasing the number of trains, and giving third-class return tickets?—If the reduction was very large there would be a large increase of third-class traffic, partly occasioned by the transference from the first-class and the second-class to the third class, and partly by additional passengers; but I do not believe that there would be an increase in the passenger receipts of the railway.

12,181. Was not this the ground upon which the North-eastern Company refused to run a parliamentary train upon the line between Penrith and Darlington, that the receipts from passengers upon that line were less than one-third of the total receipts of the line, and that therefore they were not in respect of that line a passenger railway under the meaning of the 7th and 8th of Victoria?—I understand that that was the contention.

12,182. Is not the North-eastern Railway itself gradually approaching the condition of its passenger receipts being considerably less than its receipts from minerals and goods?—They are less.

12,183. Is not each year the proportion of goods receipts become greater?—I think it is.

12,184. Therefore it may be expected, may it not, that in process of time they will arrive at the same ratio of receipts, and then cease to be a passenger railway within the meaning of the Act?—That may be so, of course, but it is very difficult to say. I do not know that then it would cease to be a passenger railway within the meaning of the Act. I apprehend that once having come under that Act they are always under it. But it is a law question upon which I am not informed.

12,185. (*Chairman.*) Now will you go to Mr. Wooler's general complaints?—The first allegation, in questions 9679 to 9682, is to the effect that at the time of the protracted storm and frost of Christmas 1860, a director of the Stockton and Darlington Railway got a promise that the North-eastern Company would allow him to use the Stockton and Darlington chaldron waggons for the coal trade to Yorkshire, a permission not granted to other parties; that, tempted by an increase of 3*s.* per ton, he took advantage of this permission, and sent so large a quantity, that he filled not only his own depôts, but those of other colliery owners, and that in consequence of the Stockton and Darlington waggons being so sent with household coals over the North-eastern Railway to Yorkshire, the iron furnaces on the Stockton and Darlington Railway were in distress for want of coals, and one was for three hours without any fuel. The imputation intended by this statement to be cast upon a director of the Stockton and Darlington Railway is quite clear; it is a mere fabrication of Mr. Wooler's, and is utterly untrue. The facts of the case are these:—In December 1860 there commenced a season of excessive and protracted cold; the consumption of coals increased so fast that the depôts, although well stocked at the beginning, began to run low. As the cold continued large subscriptions were collected, and coal clubs established in the towns and villages for the supply of coals to the poor, which materially augmented the demand. The whole stock of the company's coal waggons was brought into full operation, and this, though equal to all ordinary circumstances, was not more than enough for this occasion. We were getting through, however, tolerably well, when the canals and navigations which intersect the southern part of Yorkshire became frozen; the stocks of the dealers in water-borne coals were exhausted at once, and the whole pressure came upon the railway company, who were called upon suddenly to supply the deficiencies of the trade by water, which, over a wide district, is as large as, and in many cases larger than, the trade by railway. Every possible exertion was made by the company to meet the demand; no expense of any kind was spared, and the staff were worn down with the work carried on incessantly by day and night, and it was impossible to relieve them because fresh hands in such circumstances are worse than useless. The company's power of supply is of course measured by their existing stock of coal waggons. These were conveyed over the line and emptied into the depôts and returned as fast as possible to the collieries; but difficulties sometimes occurred there, many of the chief collieries having an equally pressing shipping trade which could not well be interrupted, and the pitmen only working short time and very irregularly during Christmas and new-year's day holidays. At York we succeeded in avoiding an actual stoppage, but so very narrowly that the depôts were quite emptied every afternoon, and the public were dependent upon what was received from the collieries during the night for their being able to obtain a fresh supply the next morning. Other places were worse off. There was a great deal of misery, especially among the poor, and the prospect of an actual dearth of coals was imminent and caused much anxiety. At that time the use of the chaldron waggons with cast-iron wheels was prohibited on the North-eastern main line and principal branches, such waggons being unfit for rapid transit; under the special circumstances, and as the only available expedient, I begged the directors to permit this rule to be waived. They acceded to this, and I urged in the strongest manner the secretary of the Stockton and Darlington Company to allow their chaldron waggons to come upon our line, requesting him to try and induce the coal owners to check the shipping trade to some extent, and turn those coals upon our line, and as this would injure the traffic of the Stockton and Darlington Railway to the benefit of the North-eastern Railway I promised that no exertion should be spared to get the waggons returned home with the utmost despatch. We were also in hourly communication with the collieries and their agents, pressing them to send us coal of any kind, in any quantities, and in any way. I consider that the North-eastern Company and the public are under obligations to the Stockton and Darlington Company, and to the coal owners, for in some degree acceding to our entreaties. Some collieries who had their sidings full of waggons loaded with coals for shipment sent them at once to the North-eastern stations; others followed the example. The result was that we received 1,562 chaldron waggons of coals from 18 different collieries, from any body indeed who would send them, and this just enabled us to keep the supply up till fortunately a thaw set in. The imputation of unfair dealing in allowing one coal owner not only to fill his own depôts, but

those belonging to other collieries, is palpably absurd. Where a coal owner had any coals in his cell, it was not interfered with; but where the cells were empty, and people clamouring for coals, and a train came in with more waggons from one colliery than the cell allotted to that colliery would hold at one time, the waggons were of course not allowed to stand idle in the sidings, but were tipped at once into one of the vacant cells and sent back for a fresh load. As to the inconvenience experienced by the ironmasters, I am greatly surprised to find it was so insignificant, and that the only case Mr. Wooler heard of was merely a delay of three hours. I am satisfied that every ironmaster in the Tees district, in weighing his own convenience, or even an interruption of his trade, against the sufferings of a great many thousand people from being deprived of fuel during such intense cold, would take a different view of the case from that put forward by Mr. Wooler. I have also inquired of Mr. Mac Nay, and he tells me that he never heard of this complaint, and in fact does not believe it.

12,186. (*Lord Stanley.*) Are we to understand you that you, as a railway company, take it upon yourselves, if there is a demand in two quarters, to consider whether the demand in the one quarter is more urgent than in the other, and to decide whether you shall supply the ironmasters first, or whether you shall supply the persons who are in want of fuel first—do you think that as a commercial company those considerations enter at all within your powers and scope of action?—Possibly they ought not as a commercial question, but when a whole country is clamorous for coals in winter it is unavoidable that we should try and relieve the distress if we can do so, especially if any parties who have a supply of coals in their hands are willing to do so.

12,187. You think that you have a right to depart from the simple rule of executing the first order first?—No, we certainly do not claim any such right. We represented to the coal owners that the public were in great distress, and that we should feel obliged if they would send us what coals they had, and we relaxed our own rules with regard to the waggons to facilitate the matter. I may add that the increased trade during the period of extreme pressure was productive of little, if any, advantage to the company in consequence of the increased expense of working; instead of engines being run at regular hours and with ordinary loads, they were kept ready, and run as coals arrived at our junctions; and were then sent to the particular places where the want was greatest. Considerations of profit in working the trade were for the time made entirely subservient to the one object of preventing any place from being altogether without coals.

12,188. (*Mr. Glyn.*) In fact you were trying to meet a case of emergency?—Yes, we were. I can assure the Commission if they had seen the state of the country at the time, people coming 20 miles to our depôts to get a little coal, they would have considered that we were quite justified in the course that we took.

12,189. (*Chairman.*) This was under special circumstances; do you know of any other cases where you have done the same sort of thing?—That was the worst case I ever knew. The next complaint of Mr. Wooler is with regard to the trade at Croft, in questions 9687 to 9698. The allegations are that the company would not give him a depôt at Croft, that they made an improper extra charge, and that they stopped the practice of the waggons being emptied by means of baskets into carts; and further that he "could," which I presume is a misprint for "would," have sold coals at 3*s.* per ton cheaper than the price at which other coals were sold there. The circumstances took place in 1859, and the facts are as follows:—The Croft depôts are situated 2½ miles from Darlington, where the Stockton and Darlington Railway (at that time belonging to an independent company) joins the North-eastern Railway. They are accessible only by a branch which is a single line joining the main line about half a mile south of Darlington. Formerly there was a large number of cells at Croft, but about 25 years ago, on the opening of the Great North of England Railway from Darlington to York, the Croft coal trade was transferred almost entirely to other places on the railway. The cells which were thus not wanted were allowed to go out of repair, and at the time in question there were 10 cells available, eight being for coals, one for lime, and one a spare cell. The sales in 1858 were only 2,871 tons, and were chiefly of coals supplied by the collieries on the Stockton and Darlington Railway and sent in Stockton and Darlington waggons. The sales being small and the depôts numerous, it was not till then considered necessary to place the trade under any regulations, and coals from any colliery were sent there. This gave rise to the usual complaints. There were so many sorts of coals that they had to be kept in the waggons, and the sidings were blocked up. Orders were sent from the public to the collieries; individuals requesting that they should be supplied with single waggons, and even half waggons of coals, which had to be kept separate from all the rest till it was convenient to receive them. The expense and labour of unnecessary shunting was more than the whole value of the dues; and the Stockton and Darlington Company complained of the intolerable detention of their waggons, which often stood a week and sometimes a fortnight before they could be unloaded. The system of allotting the cells was therefore adopted on the 1st of January 1859. The return of sales on which the allotment was made was for the 10 months ending 31st October 1858. The directors allotted the eight cells to the eight collieries who in that period had sold most coals at Croft, and it was settled that six cells should be allotted to collieries on the Stockton and Darlington Railway, and two to collieries on the North-eastern Railway. It appeared from the returns that Mr. Wooler's colliery of Cold Knott had during the period of 10 months sold only three tons four cwt. Not only had he therefore no right to a cell, but there were 20 other collieries who had a prior claim for consideration. We have an arrangement under which a person wishing to have a special waggon from any particular colliery not sending to his station, may have it on payment of 1*s.* per ton extra. This extra charge does not cover the extra cost of shunting required to keep this one particular waggon separate from all the others, the extra detention of the waggon and the occupation of the sidings, but it is allowed as a convenience to individuals, so long as it does not interfere with the proper working of the general traffic. Mr. Wooler took advantage of this permission to get waggons sent to Croft, and then refused to pay the extra charge. He seems to represent that sending waggons in this way and getting people to empty them into carts by means of baskets was a convenience to the company. It is however an aggravation of all the difficulty on account of the occupation of the sidings and interruption of other waggons till they are cleared. The directors considered that Mr. Wooler had no right by a contrivance of this kind to place himself in a position superior to that of the many other collieries whose coals were in greater demand than his own. They also considered it necessary to resist the establishment by any coal owner of a right to send any waggons he may think fit to the sidings at any of the company's coal stations without restriction, because the exercise of such a right would at once fill the sidings and stop the railway traffic. They accordingly refused to carry any more coals for Mr. Wooler except under the usual conditions. The value of the Croft trade in 1858 was 179*l.*, the expense of the agent 68*l.* If to this were added the detention of waggons and the cost of haulage of a very small trade over a very short distance and by separate engines, in quantities averaging from two to three waggons a day, it would be seen that the Croft coal trade did not pay even working expenses, and produced nothing in respect of the capital expended there.

12,190. (*Capt. Galton.*) Were the coal depôts at Croft in a dilapidated state?—Yes, there are a cer-

Capt. W. O'Brien.

16 Feb. 1866.

tain number of them which in the course of the last few years have become dilapidated, but at the time that he spoke of there were 10 cells, which were in good order, and which were occupied by other coal owners, and we refused to be at the expense of putting more cells in repair for a trade of only 2,871 tons.

12,191. Had he ever offered to put one in repair at his own expense if you would let him have it, and was that offer of his refused?—Yes. We refused to let any one have rights of property over our ground, and we say that 10 cells was more than was required for 2,871 tons. There is also an allegation by Mr. Wooler connected with the West Hartlepool waggons, that we have different rules with regard to coke and limestone, and he says "the limestone belongs to a "director, and the coke belongs to me."

12,192. He says that they will not give the same facilities with respect to coke as to limestone, is that correct or otherwise?—Our rule is to give coke waggons to everybody that applies, whether he is director or anybody else. There are other rules with respect to limestone which equally apply to a director as to anybody else; the same facilities in the same trade are given to everybody. There is a further statement about coke which was sent to Glasgow, and with regard to that I state this on the authority of Mr. MacNay,—"With reference to the "allegation about coke to Glasgow there is no dif- "ferential rate, but I did hear that the quality of the "coke sent by Mr. Wooler was so very inferior that "the parties refused to take it, and gave the preference "to a better quality of coke, which in all proba- "bility did command a better price but not through "any difference in the rates, as these were uniform "throughout."

12,193. His allegation was, I think, that a director had got a more favourable rate than he had?—Yes, and that I contradict distinctly.

12,194. There was another allegation, was there not, that once he had to load a ship with coal, and that the mineral manager took the waggons which had been allotted to Mr. Wooler and loaded them with his own coals, and prevented him from sending coals to this ship?—It may have been the case I mentioned, that the coal owner, instead of sending the coal to the ship, sent it to land sale on the North-eastern Railway.

12,195. (*Mr. Gower.*) You have no local railway competition throughout your district, have you?—Nothing worth mentioning. We have private coal railways from the pits to the sea, which of course are in competition with us, but we have no public railways except the Blyth and Tyne.

12,196. In consequence of that private railway competition, are your rates lower than they are on those railways?—No. I think we all carry at much the same rate. We have recently made an arrangement by which Lord Durham, who had his own railway, transfers his coals to the North-eastern line.

12,197. Have you canal competition on a part of your system?—Yes; on the southern part of the Yorkshire end of our line we have canal competition.

12,198. Does that influence your rates at all?—Yes.

12,199. To what extent?—I am afraid I could hardly say.

12,200. (*Chairman.*) Have you made arrangements with those canals?—I think with the Aire and Calder, we have; not an arrangement but a sort of understanding, that we shall go on as we have been doing, that neither shall attack the other.

12,201. (*Mr. Glyn.*) Do you carry at equal rates with them?—No; we do not consider that at all; they make their charges and we have made ours, and the result is that a large quantity of coal is carried by water and a large quantity by rail, and we have no other understanding but that we shall not each of us begin a competition with the other; at all events not without notice.

12,202. (*Chairman.*) Are you mutually satisfied at present?—Yes.

12,203. (*Mr. Glyn.*) You do not reduce your rates one against the other?—No; we are not to do that without giving certain notice.

12,204. (*Lord Stanley.*) I suppose that is rather a matter of amicable understanding than capable of strict definition?—Quite so; it is merely an amicable understanding.

12,205. (*Mr. Gower.*) Are you proposing any extension of your railway in this coming session of Parliament?—We have some bills before Parliament this year.

12,206. Are there any railways projected in the district independent of your lines?—Yes, there is one considerable one which is promoted in opposition to us.

12,207. Between what points?—It is from Skipton by Wharfdale to Leyburn, and so by Yarm to Middlesbro'.

12,208. (*Chairman.*) Part of that line was got last session, was it not?—Yes, a little bit; a few miles near Grassington.

12,209. (*Mr. Glyn.*) In fact it was from Middlesbro' to Settle?—Yes, or rather to Skipton.

12,210. (*Capt. Galton.*) In fixing your rates do you allot anything for terminal charges?—No, we do not allot anything for terminal charges; our rates include all our terminal expenses.

12,211. Are your rates then in excess in some cases of your parliamentary limits to an extent which would cover the terminal charges?—Yes.

12,212. Do you see any objection to having the maximum terminal charge fixed by Act of Parliament just as the maximum mileage rate is fixed by Act of Parliament?—If it is a fair maximum I see no objection to it.

12,213. Do you think that it would be possible to fix a maximum which would be fair all over the country?—Any maximum that you fix may be fair on an average, but I think it must be unfair under particular circumstances.

12,214. (*Mr. Gower.*) In short, a maximum which would be fair under extreme circumstances would be of very little use under ordinary circumstances?—If it is to be a maximum it must be large enough to cover short-distance traffic, and if it is large enough to cover that, it is larger than the railway companies of their own accord would adopt for other traffic.

12,215. (*Capt. Galton.*) Is it larger than what the railway companies of their own accord adopt for short-distance traffic now?—They do not, properly speaking, adopt any charge; they do get to a charge, and if you deduct from it the toll, that leaves a sum which they call their terminal expenses.

12,216. And which varies in every case, I suppose?—It will vary from the highest charge put on in any case to the lowest.

12,217. About what is the highest, should you think; I am not speaking of London, but at any town in the country?—I fancy that 2*s.* 6*d.** is probably the highest that is actually charged.

12,218. (*Chairman.*) For what description of goods would that be; coals are nothing like so high as that I presume?—No; coals are very different. Timber is a bad thing to deal with; for a short distance there is a loss. Then again, if you take a very expensive article, like silk for instance, there you charge the highest terminal, you adopt a rate in fact which includes a high terminal.

12,219. (*Capt. Galton.*) Why does silk require a high terminal? What is the expense upon it?—It is not with regard to expense altogether, but there is great risk attending the carriage of it and it is in small packages.

12,220. You charge that, do you, as a sort of insurance against risk?—We do not charge it distinctly as insurance, but it is a charge by which we do get in some sort insured.

12,221. You put, in fact, very much more than your maximum parliamentary rate upon it in order to insure

* Afterwards altered by witness to "2*s.* 6*d.* or 3*s.* 6*d.*"

yourselves against damage?—In order to protect ourselves against risk and all other expenses.

12,222. (*Mr. Glyn.*) Then I understand you to say that a general uniform terminal rate, if taken at a proper rate to remunerate railway companies, would on the whole be rather too high and onerous for the general traffic of the country; that is to say, that it would barely cover the expense in the larger places, but it would fall heavily upon some of the smaller ones?—It is so. It would barely pay us in the one instance, and would more than pay us in the other instance.

12,223. (*Chairman.*) Is there not a regular scale of terminal charges in force at the clearing house in all arrangements between different companies with regard to the interchange of traffic between different companies?—The division of the through rate is arranged through the medium of the clearing house, but the clearing house in itself has no power to settle anything about rates or terminals, but the companies amongst themselves, from the intricacy of the accounts must go by some rule, and they have fixed what are called "clearing house terminals" for division amongst themselves, and as the companies are on the whole in similar positions it signifies very little what those terminals are.

12,224. (*Mr. Glyn.*) Is not the information as regards terminals rendered to the clearing house by each company itself?—The companies have agreed to a particular terminal, and under their instructions it is charged through the agency of the clearing house.

12,225. (*Earl of Belmore.*) It does not follow, does it, that because it is charged through the agency of the clearing house it is the charge that you have actually paid upon any particular class of traffic?—No, there is no connexion between the two.

12,226. (*Capt. Galton.*) In the clearing house the terminal charge is 4*s.* per ton, is it not?—Yes.

12,227. That is to cover the two terminals?—That is the terminals on the division of the through traffic.

12,228. 2*s.* per ton terminal at each station?—Yes, but not for London.

12,229. An allowance of a rate of 8*s.* 6*d.* per ton for London and 4*s.* per ton for the country is made for terminal expenses on goods traffic when carted, and 1*s.* 6*d.* per ton when not carted?—Yes, it is 4*s.* at each end carted, and 1*s.* 6*d.* not carted.

12,230. Would it be unfair to fix that rate in an Act of Parliament if it is what the railway companies have themselves adopted as a fair rate?—No, you must distinguish between the two things; one is the charge to the public and the other is the charge for division between the railway companies. Supposing that two railway companies were in exactly the same position it would not signify whether that 1*s.* 6*d.* were 5*s.* or 10*s.* or 6*d.*; the result would come out the same, for what you lost on one you would gain on the other. Therefore there is no connexion between what is called the clearing house terminal and the charge to the public.

12,231. Then practically the terminal charge becomes a means of enabling a company to get a larger amount of mileage rate than they otherwise would get?—No, it has nothing to do with the mileage rate; it enables the company to cover the expenses that they have incurred by becoming carriers instead of doing the old original duty of railway companies, which was merely conveyance upon the railway itself from point to point.

12,232. (*Earl of Belmore.*) It means the haulage of goods by means of locomotives, the railway companies using the carriages or trucks of private owners?—Or their own. It is merely the use of the road from point to point and the use of engines and waggons.

12,233. Do you consider that terminal charges include the remuneration to the company for these services?—Not at all; the terminal charges are totally distinct from what the toll is given for. The word toll originally was taken from the canal acts, and toll applied to railways meant exactly what toll applied to canals now means, namely, the use of the road and nothing else.

12,234. (*Capt. Galton.*) In the Acts of Parliament there is invariably a scale of tolls put in, is there not, in case the railway is used by other parties, and also a scale of charges to be taken or an additional sum to be charged when locomotive power and waggons are provided?—Yes.

12,235. Therefore the charges that you make under that head are independent of the question of terminal charges?—Yes, certainly.

12,236. Terminal charges, as I understand you, are what would cover the cost of the collection and delivery of goods, and those expenses which are incidental to the invoicing and booking?—No, they involve a great deal more than that, and are quite different from that. The toll in the first instance is a canal toll which is charged for the use of the road, and it is that plus the cost of the engine and waggons, and that is all. In addition to that the company undertakes carriers' duty, for which it charges terminal charges.

12,237. What do you define the carriers' duty to be, independently of carrying goods on the railway?—Everything other than what is included in the word "toll" as defined in the canal Acts, and the addition made to that in the railway Acts of the haulage from point to point. Every other service is a carrier's service which the company have a right to charge for and for which they do charge terminals.

12,238. The Act of Parliament says, does it not, that for that they may charge a reasonable sum?—No, the Act says that they may charge a reasonable sum for certain things, but it does not limit it, and the right to charge for terminal duty is their right as carriers.

12,239. Do you mean that in addition to what the Act says they may charge as a toll or rate per mile, they may charge a reasonable sum for the other services?—When they do the other services they may charge for them.

12,240. (*Earl of Belmore.*) Do you include station accommodation amongst those other services?—Yes.

12,241. In the case of passengers would you put an extra price upon their tickets in addition to your maximum parliamentary rate under the head of station accommodation?—That point has never been raised, and as it has never been raised I am unable to give an opinion about it. Of course no terminal is charged for passengers.

12,242. (*Mr. Glyn.*) Will you state to the Commissioners what you would include in your calculation in making up a terminal rate, and whether you include capital laid out in stations, and what other things besides that?—First, there is the capital laid out for stations, warehouses, and sidings and all the fixed appliances, cranes, platforms, weighing machines, roads, and other property. Then there are all the working charges, repairs, renewals, and insurance of property, porterages and labour of all kinds, clerkage, shunting by horses or engines, gas, rates, straw, damages and compensation, cartages, and all those other services which are incidental to the duty of a carrier.

12,243. (*Chairman.*) Would you include clerks employed in making out the accounts connected with the railway?—For delivery to customers we should have a right to do that.

12,244. (*Mr. Glyn.*) You have had great experience for many years with regard to the interchange of traffic with other companies; have you ever found any difficulty in making arrangements in any way with those with whom you are in immediate connexion?—We never have much difficulty; we dispute sometimes, like other commercial bodies, but ultimately all those things are settled.

12,245. Have you ever found any difficulty in getting traffic in your part of the country conveyed to Liverpool or Manchester, or any other place?—No, not the least; railway companies are too happy to get traffic from wherever they can get it.

12,246. Do you make through rates whenever you are asked to do so?—The only difficulty which I have

Capt. W. O'Brien.

16 Feb. 1866.

experienced has been with companies in Scotland, and ultimately that has yielded to representations and a little pressure without the necessity of any legislative enactment about it.

12,247. You never find it even necessary to go so far as to say that you would cease to book through for them ?—No ; it has been rather that they would not book through with us.

12,248. Was not it rather that they would not carry on for you ?—They would not book through with us. It was with regard to Aberdeen ; we wanted rates down north of Aberdeen, and the company north of Aberdeen said that they thought they made more by local rates than by joining in through rates.

12,249. Is not the real difficulty that arises in making a through rate for continuous traffic a desire on the part of those companies whose receipts are not very large to adhere to their local rates ?—I think that that is the chief difficulty ; but my experience has been that ultimately they see the necessity of falling into the general system.

12,250. (*Chairman.*) When a through rate is made, is it the general practice that each company takes its mileage share and nothing more ?—That is generally the practice.

12,251. Do you ever make an exception to that ; do you ever allow a larger share than that ?—Yes, we do.

12,252. (*Mr. Glyn.*) Do you find much difficulty in arranging for the conveyance of your goods ; do you often find impediments at junctions ?—Not the slightest.

12,253. Wherever you establish through rates with another company, do you always find that company ready to do its part in the arrangement ?—They do their part more or less well according to circumstances, but there is never any real obstruction.

12,254. In point of fact, so far as that matter is concerned, the Act of Mr. Cardwell, as you remember, has never been virtually brought into operation at all, because the voluntary action of the railway companies has rendered it unnecessary ?—So far as my experience goes, everything that that Act directs to be done has been done voluntarily without parliamentary interference.

12,255. Do you apply the same remark to passenger as well as to goods traffic ?—Exactly the same remark.

12,256. Do you apply the same remark to all branch lines, that they always arrange so as to fall in with the great arteries, the main lines ?—No, I should feel that that is a matter in which you cannot interfere with the discretion of companies. As a rule, they do the best for their general interests, and I think that it would be monstrous for one company to insist upon another company running branch trains unnecessarily merely to suit the convenience of the first company.

12,257. Taking the case of a passenger going from Newcastle to Liverpool, which do you call the direct route, and how many hours would it take ?—There are nine routes between Newcastle and Liverpool ; the one principally used is by Normanton, or the one by Leeds to Liverpool ; both of those are used.

12,258. (*Capt. Galton.*) I suppose the route used would entirely depend, or nearly so, upon the facilities given by the trains of the North-eastern Railway Company ?—Or by the trains of other companies going forward from the North-eastern termini.

12,259. I mean the trains which run to suit the other companies' trains ?—Or the trains of other companies which run to suit ours ; it is a matter of mutual arrangement.

12 260. (*Mr. Glyn.*) Are we to understand you to say that you can book through from Newcastle to Liverpool by nine routes ?—Yes.

12,261. (*Capt. Galton.*) Can you take a through ticket by any route ?—I am not sure whether through fares have been established by all the nine routes or not.

12,262. Is there any route by which you can take a through ticket to Liverpool ?—Yes, by the Normanton route, by the Leeds route, by the Carlisle route, and by the Tebay route.

12,263. (*Mr. Glyn.*) Can you do so by your own route, by the Newcastle and Carlisle ?—I believe we can ; I do not at this moment recollect.

12,264. (*Chairman.*) You are not of opinion that any amendment of Mr. Cardwell's Act is called for, or any additional enactment bearing upon the interchange of traffic between different railway companies ?—I am of opinion that nothing more is wanted at present. As a general rule I think we find that commercial matters cannot be carried on by a system of penalties ; I would far rather leave it to the operation of the pressure of companies and of public opinion, because at last you get that done voluntarily and willingly, which if it were done by the force of an Act of Parliament would create hostile feelings and interruptions.

12,265. (*Mr. Glyn.*) The Commission have had complaints from one or two quarters that the trains on many branch lines do not meet other trains at their junctions with the main lines, but I presume that your experience would lead you to say that that nearly always arises from the difficulty of making the through quick trains dovetail with the slower branch trains in the different districts ?—I should think that we have more experience of that than any company in England. Every effort is made to make the trains fit, and when they do not fit it is from the necessity of the case. You may remedy any evil but only by producing still greater evils. We run an unnecessary number of trains to meet that very difficulty, and still it exists. I would also say that the real remedy for all those evils is to be found in the companies being in a prosperous state. The moment their dividends get up then the whole stream of accommodation is increased, trains are run and facilities of all kinds are given without hesitation, because all those facilities really mean the company going to an increased expense.

12,266. (*Capt. Galton.*) You consider that if the dividends of companies rose to a good margin of profit on most lines the accommodation would then be very considerably increased ?—That is a point on which my opinion is very strong indeed, and I go by the experience of the North-eastern Company. The North-eastern Railway Company, before 1854, was in difficulties about its dividends. In that year we amalgamated with neighbouring companies and succeeded in putting the company on a sound financial basis, and there was no longer any fear as to our debentures or preference stock. It took two or three years to make ourselves perfectly sound and safe, and during that period we did not apply for for any extension at all. After that our traffic increased, our position was strengthened, and since then, according as we have been able to do it, we have gone on increasing the accommodation. In 11 years we have expended upon new lines and branches, all in our own district, and none of them for aggressive purposes, about 2,000,000*l.* ; we have spent in improving the existing lines more than 2,000,000*l.* ; we have spent in rolling stock a million and a half; we have come under obligations to construct new lines, costing more than two millions ; we are going to Parliament this year for new lines for another million ; and we have given orders for the construction of rolling stock now to the amount of 400,000*l.* During that time we have reduced our passenger rates ; we have reduced our goods rates ; we have reduced our coal rates ; we have extended the system of return tickets, and all those minor conveniences greatly ; and over the same lines of rail we have increased the number of passenger trains 20 per cent. I believe that what we have done is to some extent done by other railway companies, and I am quite sure that if our dividend goes on increasing we shall go on at this work in an accelerated ratio ; I hold, therefore, that it is nothing but perfect security for our money and a fair prospect of a good dividend that is wanted, and this country will be covered with railways far more than it is now, and their charges will be lowered.

12,267. (*Earl of Belmore.*) Do you generally run your passenger trains with full loads, comparatively speaking ?—No ; the truth is that the passenger service

has very little reference to the actual load. We find in thinly populated districts that it takes a certain number of trains in the day, say five, to give what I would call the minimum of accommodation, and we run that number of trains without reference to the number of passengers.

12,268. (*Capt. Galton,*) You mean five trains in each direction?—Yes; we look upon that as giving a fair service.

12,269. (*Earl of Belmore.*) I presume that you limit the number of carriages that you put on to a train according to the number of passengers who, you think it probable, will require to be carried?—We put on more than we have any expectation of passengers ordinarily coming to fill, so that we should be prepared for the fluctuations of traffic.

12,270. Do you think that if the fares on your line were materially reduced, you would run your trains with a larger number of passengers in those carriages than you do at present?—We should run them with a larger number of passengers, and we should have a larger number of carriages.

12,271. (*Mr. Glyn.*) There has been an extraordinary development of trade in the north-eastern district, has there not?—Yes, there has, especially in goods and minerals.

12,272. Dating, I suppose, back to about from 1847 or 1848, or perhaps later than 1850?—Later than that I should say.

12,273. (*Chairman.*) May not a portion of your district be considered as purely agricultural?—A large portion.

12,274. Do you find that the traffic in that part of the country has increased?—The passenger traffic is increasing very little, and I think that the first-class passenger traffic generally is not increasing much over the railway. It is the lowest class that is increasing most.

12,275. (*Capt. Galton.*) And not, I presume, from the transfer of the second class to the third class?—There is a large transfer always going on, but of course one is unable to say the amount.

12,276. Still if persons travel twice third class for once second class, that remunerates the company, I presume?—It would not remunerate the company so well; but of course a passenger may travel oftener. But if you carry a man one journey for twopence, it is better to carry him that one journey than two journeys at one penny each.

12,277. (*Chairman.*) In the agricultural district has there been an increase in other descriptions of traffic?—There has been an increase in goods, that is to say, in agricultural produce. I think that that is connected with the improvement of farming.

12,278. Do not you find that farmers, as a class, travel about more than they did?—No; I mean that the increase has been with regard to manures and all the articles that enter into the farmers' consumption. We have a larger traffic in those things.

12,279. Do not you think that the farming population travel about more than they did?—The increase of the passenger traffic in a purely agricultural district is very slow.

12,280. (*Mr. Glyn.*) With regard to the interchange of traffic between companies, does not a great deal of that interchange arise from agreements between companies?—If there is any probability of traffic being valuable, a company will take advantage of particular opportunities to get an agreement, then that settles it for the future.

12,281. That settles it for the future, but it does not legalize it for the future, does it?—Some of those agreements are scheduled to the Acts and legalized, and have the binding force of an Act of Parliament.

12,282. But you must, in point of fact, get an Act of Parliament to give legal effect to an agreement of that sort, otherwise you run the risk of its being put an end to at any time, do you not, by an adverse shareholder?—No; I think that if the agreement itself is valid it will bind the company without any reference to the action of a shareholder.

12,283. Supposing there were a legal difficulty as regards the power of those agreements, would not it be rather a public benefit if by some general Act they were allowed to be registered, and in some way have the force of law, so that they might not be interrupted?—That idea cuts two ways. The instant you attempt to bind the companies permanently to anything that they never can escape from in any way, you increase the disinclination to go into those agreements. Our feeling in the railway world has been that it was a mistake to make very long agreements. That we ought to make short agreements with a view of modifying them as circumstances altered. And I think that many general managers would say that a short agreement will last longer than a long agreement.

12,284. If not interfered with by any adverse party you mean?—When once you have got an agreement it goes on unless there is a very strong reason indeed for terminating it, especially if it is so short that it can be modified to meet changing circumstances. There is very little disinclination to make agreements, but there is a great disinclination to be tied up for any long period of time to specific arrangements when the circumstances may have entirely altered.

12,285. You work under several agreements at the present moment, do you not?—A great many.

12,286. On the whole they work very satisfactorily, do they not?—I think they all work satisfactorily except what is known as the English and Scotch traffic agreement, and there we made, I think, a mistake in making a long agreement, and the consequence is that with seven or eight parties to it we cannot modify it, because any one company stops the action of the modification. We are therefore struggling on under that agreement, which does not suit the existing state of things.

12,287. Of course that would be very much met by a periodical revision, and a clause in each agreement providing for that?—Yes; if we had made that English and Scotch agreement for five years only instead of making it for 14 years, we should have been working under it amicably now.

12,288. (*Chairman.*) One point on which the Commission are required to make inquiries is whether any considerable reduction in the cost of conveyance may be practicable; do you see any possibility of reducing the cost of railway conveyance?—With regard to that point I may say that we are all struggling every day to reduce the cost, but so far from succeeding in it we shall I think increase the total cost.

12,289. You think that there is more probability of an increase than a decrease?—I think there is, for this reason, the tendency of all companies is to work better and quicker, and that means cost. Any mechanical improvements in engines or motive power are slight, and anything we have hitherto got affects the cost of conveyance very little. In fact the rise of coke in the last 12 months would neutralize all the improvements in engines for the last 10 years.

12,290. (*Mr. Glyn.*) Can you have any stronger inducement on that head than the desire that the directors have to make good dividends?—The company's interest is the strongest motive that there is to work with the greatest possible economy, and the only fear on the part of the public would be lest they should carry that desire too far.

12,291. They always, as soon as they can with propriety and safety, adopt any suggestions that may tend to economy in cost?—Yes, it is their strongest interest to economise in every possible way, but what we have seen press upon the board of directors is the dividend. If that is low the economy is carried perhaps to an extreme extent, but the moment that the dividend gets to anything reasonable the door is opened to expenditure in the way of very largely increasing the accommodation.

12,292. (*Capt. Galton.*) What do you call a reasonable dividend?—Mr. Hudson used to say that 10 per cent. was a constitutional dividend, but many applications are made for a reduction of rates by parties representing that their traffic is crippled by the high

Capt. W. O'Brien.

16 Feb. 1866.

railway charges, and you will find those very men getting up limited companies, receiving an enormous amount for good will, and guaranteeing 10 per cent. for five years, and yet they expect that the reduction is not to fall upon them but upon a railway company dividing like ourselves 5 per cent.

12,293. Do you consider that any improvement could be made in Acts of Parliament in the classification of goods so as to make them uniform?—There is no doubt that the parliamentary classification is very defective. At the same time I am not aware of any evil that has resulted from its being defective. If one knew of any evil, then one would like to alter it and meet that evil, but I am not aware of any.

12,294. Practically it is not adhered to much, is it?—Yes, it is adhered to closely as a maximum. Practically the parliamentary toll is our maximum.

12,295. The classification is very much that of the clearing house, is it not?—The classification adopted by railway companies in making their charges is that of the clearing house, but there are a great variety of local classifications which differ from that. But the parliamentary toll, which is a different classification, is still perfectly valid for its purpose, that is to say, it is the maximum.

12,296. Is not it such a classification that no person consulting the Acts of Parliament could possibly tell what he would have to pay for sending a particular description of article from one end of the country to the other?—That is an evil, but it is an evil applicable to every possible classification. No person, by looking at any classification, can tell what he has got to pay.

12,297. He could tell what maximum rate he would have to pay, could he not, if the classification was uniform?—Yes; he could do so under any classification. He can tell now, under the parliamentary classification, what the maximum is, just as well as he could if you altered the classification.

12,298. Is it not the fact that under the parliamentary classification at present, on one railway, goods fall into one class, and upon another railway the same goods fall into another class?—I believe that the parliamentary classification is nearly the same in all Acts of Parliament, but you know how that is better than I do.

12,299. (*Mr. Glyn.*) Do you not think, after the experience of 35 years, that it would be desirable to revise the classification?—I see no objection to it at all. On the contrary, I think it does not look well to have a parliamentary classification which is not founded upon common sense.

12,300. (*Capt. Galton.*) Do you think that it would be advisable or advantageous, as regards the public, if the rates which were charged by railway companies were accessible to the public?—They are accessible to any person who chooses to ask for the information for the purposes of trade.

12,301. Could they be published?—I think not. Our local rates may amount to perhaps between 3,000,000 and 4,000,000, to say nothing of the through rates.

12,302. Then that is the cause. You give a special rate in every case, I suppose?—No; we wish to have as few special rates as we can, but we are driven to it by the necessity of the case. You must have rates between every station and every other station first. You then have seven or eight different classes of rates. Then you have a whole multitude of exceptions to those rates again, so that the rates between any two stations may be a very great number, and if you come to multiply that as between all the stations, you get to millions.

12,303. If it was the object of a railway company to simplify the rates, it could probably have laid down a certain scale of terminal charges which would be charged, and a mileage rate which would be applicable to a large number of stations?—No doubt, if it was the object of railway companies to do that, they could do it, but it never can be their object, because it is distinctly contrary to the public interest, and it must injure trade. They carry it out now as far as ever they can.

12,304. How is it contrary to the public interest that they should define their rates in that way instead of in charging the rates a lump sum?—Because, I think, the definition which you gave would produce a uniform rate.

12,305. No, I did not say a uniform rate. I said a mileage rate. Would you not classify it under certain stations?—If you mean that it is to be a varying rate, that is our practice now, and where the trade will admit of it we do group certain stations together, charging the same gross rate though the mileage is different.

12,306. But what safety have the public under the present arrangement, that one individual may not be more favoured than other individuals. What means would anyone have of detecting that if it was done?—I do not know that there is anything to prevent the board of directors charging a low rate to an individual, or, in fact, doing anything else that is wrong, and trusting that they shall not be found out, and I think that would occur under any possible system.

12,307. (*Earl of Belmore.*) The injury in a case of that sort would be not so much to the public, but to their own shareholders, towards whom they would fail in their duty if they charged a lower rate than they ought to do?—It really amounts very much to that. If carried to any excess it would be almost a malversation of office, it would be particular favouritism to one particular person, which we suppose would not be done without a reason, and which in such a case would be an improper reason.

12,308. (*Capt. Galton.*) With respect to goods traffic, and the amounts that you are liable to pay for damage, there are certain goods which are classified under what was the Carriers' Act, and in respect to them the liability for damage is limited, is it not?—Yes; in that case as carriers we have that protection.

12,309. In cases of other goods there is no limit, is there?—None by the Carriers' Act.

12,310. Do you think it desirable that a certain limit should be afforded in such cases, and that insurance should be required beyond that?—Yes; I see no objection to the protection given to carriers being revised and adapted to the altered state of things. Companies now protect themselves as well as they can by making a special arrangement for hazardous articles not included in the carriers' list of protected articles.

12,311. With respect to passenger traffic, do you consider that any limit should be fixed for the amount to be paid for injury to passengers, and an insurance required for any sum beyond that?—That question has been a good deal discussed, but I do not think that any plan has been suggested which would be likely to meet the views of Parliament.

12,312. Do you consider the present arrangement a good one for enforcing care on the part of railway companies?—In that respect any system would do that. Of course if companies are liable to heavy damages there is a strong pecuniary interest on their part to take every care; but that is not the difficulty which has been felt; the difficulty which has been felt has been in the case where two men pay the company the same sum of money and both are injured; one man gets damages to the amount of 10,000*l.*, and the other to the amount of 1,000*l.* Whilst I do not say that the present system is free from defects, yet I confess myself unable to suggest a legislative improvement upon it.

12,313. (*Mr. Glyn.*) Do you think that it would be possible to improve it by the question of fact being left to a jury, and, the facts being ascertained, the question of the assessment of damages being left to some other tribunal?—I am afraid that in this country anything that appeared to trench on the privileges of a jury would not meet with favour.

12,314. In fact sometimes are not excessive damages given by juries, even upon the admission of the judge himself, who has tried the case?—There is no doubt that a jury is a very unfair tribunal towards the wealthy railway company.

12,315. (*Earl of Belmore.*) I gather from your evidence that you do not think it would be practicable by any change in the law to secure a more economical,

safe, expeditious, punctual, and cheap transit of passengers and merchandise?—I think those are matters which the law could do nothing in.

12,316. (*Chairman.*) Have you ever considered the question of the transference of the railways to the Government?—Yes.

12,317. What is your opinion as to the advisability of such a step?—Speaking as a shareholder I should be most delighted if the Government would entertain such a proposal.

12,318. (*Mr. Glyn.*) Under a guarantee?—I take it for granted that they would have to pay more than the thing is worth at the moment, and such a proposal would be very acceptable to the shareholders. But in a country like this for the Government to undertake the management of commercial transactions like that of the whole carriage of the commerce of the country I think is the wildest scheme that I ever heard of, and I should hope that it never will be entertained, and that this country will take warning from what they see going on upon the continent in that respect.

12,319. A suggestion has been offered in some quarters that the Government, instead of managing the railways, might acquire the property of the railways, and let them out to parties who would be willing to lease them; do you think that that would be open to the same objection?—I think that that is the worst suggestion that has been made yet. I conceive that if you separate the ownership of the line from the man who leases it you will introduce every possible evil that can be imagined. The men who would have the working of the traffic would not be the men who lay out the money to provide the conveniences for working the traffic. Suppose that a new siding is wanted, in such a case it must be laid down by the Government who have no interest in laying it down, because their rent is secured; and the lessees are not likely to expend capital upon other people's property; therefore the siding would not be laid down, and the traffic would not be carried at all. And the lessees having no permanent interest in the property, or in conciliating the public, would be very much worse to deal with than the present railway companies.

12,320. (*Capt. Galton.*) Have you any owner's waggons on the North-eastern line?—We have a few of the colliery owners, but not a great many private waggons for goods; we prefer having them all the property of the railway company; we think that that plan works better, but we never make any difficulty if anybody likes to send his own waggons.

12,321. Have you any regulations to prevent the detention of owner's waggons, so as to insure that they shall be returned to their owners with as great rapidity as possible?—On our own line they are worked just like our own waggons and sent back exactly in the same way.

12,322. You would not allow them any demurrage if you detained them, would you?—No.

12,323. Do they ever make complaints to you of the detention of their waggons?—Not so much on our line. The private waggons on our line in the coal trade chiefly go to places beyond our line, and they chiefly go, not to stations, but to private sidings—sidings of ironworks, and that class of people, over whom the company has no control. There they are detained a long time, and I am sorry to say that our own North-eastern waggons are detained a very long time also.

12,324. But you charge demurrage in such cases, do you not?—No; we can get no demurrage in such a case; the owner of the works says that he will not pay demurrage whatever happens; and the railway companies say, We will not pay demurrage because the waggon is not detained by us, it is detained by the owner of the works; and therefore between the two we get no demurrage, and we are driven to choose between going without demurrage and standing the loss, or giving up the trade.

12,325. Do you bind yourselves in forwarding goods to deliver them within a specified time?—No; in that case we are bound generally by our practice. If we were in the habit of delivering goods, say in 24 hours, and if any person came to us and tendered goods for a particular place, there would be an implied contract that we were bound to deliver them there within about 24 hours.

12,326. Do you consider that any advantage would result from legislation upon the subject of the punctuality of passenger trains?—I think great disadvantage would arise, because the instant you attempt to control commercial bodies by penalties, they are bound to protect themselves, and therefore the moment that you insist upon punctuality, it would be attained by the only practicable means, namely, by going so slow that you are sure to be in time.

12,327. Is it not better to be sure to be in time than to expect to arrive at one time, and to arrive an hour too late?—I think not. I am afraid that if a passenger were going from London to Edinburgh, it would be no comfort to him to be four hours longer on his journey, in order that another person should not be 10 minutes late between York and Darlington.

12,328. You think that the less interference there is by the Government with railway traffic the better?—I do not say that we should wish to be exempt from the control of Parliament, but generally I say that ours is a commercial concern, and in the case of all commercial concerns the more Government will let them alone, the better the work will be done for the country as well as for ourselves. We merely ask to be let alone, especially by the Post Office and the Board of Trade. The Post Office have taken from us our parcel traffic under powers acquired distinctly for no other purpose than the carriage of letters. We are quite ready to do anything that may be wanted for the letters, but we feel it very hard that those powers should be, as we think, abused for the purpose of transferring the receipts of a large parcel traffic to the profit of the Post Office, that is to say, of the country generally, and taken from the railway company, the railway company being at all the trouble and expense.

12,329. If the railway companies had organized an efficient parcels traffic, do not you think that they could compete with the Post Office upon their own lines?—Certainly not. The Post Office having got an award for carrying letters at a certain rate, choose to call parcels letters, and they thus get them conveyed without paying a single farthing to the railway company.

12,330. Is there any properly organized parcels traffic between the different parts of the country on railways?—There is.

12,331. Could you put a parcel on the railway at Liverpool or Newcastle, for instance, and have it delivered the next morning at Southampton?—No, that is what the Post Office cannot do; but we can deliver it the next morning in London. The Post Office by their present system take a parcel and deliver it the next morning in London without paying the companies one farthing for it, and they take the whole of the profit.

12,332. But they pay, do they not, in proportion to the weight of the mails that they carry?—No.

12,333. Or the number of bags that they carry?—No, they do not.

12,334. (*Mr. Glyn.*) That is to say, if you want to make them do so you must do it under arbitration?—We go to arbitration, but the arbitrator, as I dare say you know, will not go into that question at all. We are quite willing to carry the letters, and to make no complaint, but under the guise of carrying letters quickly and cheaply the Post Office take parcels which really belong to the railway traffic.

12,335. (*Capt. Galton.*) Ought not you to be able to carry parcels quite as cheaply as any one, seeing that you are in possession of the line and must run but one train for the Post Office?—No, we cannot. Those parcels are carried from Newcastle to London on the railway without the Post Office paying anything for it; we are at the expense and they get the whole of the money.

12,336. If you carried the parcels yourselves you

Capt. W. O'Brien.

16 Feb. 1866.

could do so perhaps at a cost of little or nothing, as the train must run, and therefore you could organize a service, could you not, which could compete with the Post Office ?—Certainly not; because the Post Office use our expenditure and spend nothing themselves; it costs the Post Office nothing.

12,337. (*Earl of Belmore.*) Do the Post Office pay you anything for the conveyance of letters ?—Under the present system the Post Office can order a train to be run at any hour they like, and they can put on a carriage or anything they please, and go to arbitration to settle what they shall pay for that carriage. That arbitration is given under the feeling that letters should be carried at the least possible cost to the country, and my complaint is that parcels are carried by the Post Office without any additional payment to the company. If the company put them into the company's van the receipts would go into the company's coffers, but because they are carried in the Post Office van the Post Office gets the whole of the profit.

12,338. (*Mr. Glyn.*) Supposing that the carriage of parcels involved the carrying of a large extra weight, the arbitrators in that case would assign a larger payment, would they not?—I have no great faith in what arbitrators would decide. The feeling that the postal service of the country is to be conducted quickly and cheaply, is such an overwhelming feeling in their minds that I do not think the companies get full justice in the arbitrations.

12,339. (*Capt. Galton.*) The Post Office complain, do they not, that they do not get justice?—They certainly do.

12,340. (*Mr. Glyn.*) On the other hand, the companies say the arbitrators generally decide in favour of the Post Office ?—They do.

12,341. (*Earl of Belmore.*) Do not the Post Office pay the companies which convey their mails a certain rate per mile?—Yes, they do, and the rate is settled under arbitration.

12,342. It makes no difference whether they carry a large mail or a small mail, a large quantity of bags or a small quantity of bags, by any particular train?—There are limits within which it would make a difference.

12,343. But the number of parcels which the Post Office now carry does not up to this time make their number of bags exceed those limits?—No; because when you put on a large travelling Post Office, you may carry tons of parcels in it without filling up the space.

12,344. (*Chairman.*) Do any other points occur to you upon which you think you could give information which would be of use to the Commission?—Nothing occurs to me just now.

The witness withdrew.

Adjourned to Tuesday next, at 12 o'clock.

Tuesday, 20th February 1866.

PRESENT:

THE RIGHT HON. THE EARL OF BELMORE.
THE RIGHT HON. LORD STANLEY, M.P., F.R.S.
THE HON. E. F. LEVESON GOWER, M.P.
SIR ROWLAND HILL, K.C.B., F.R.S.
T. B. HORSFALL, ESQ., M.P.
GEORGE CARR GLYN, ESQ., M.P.
CAPT. DOUGLAS GALTON, R.E., C.B., F.R.S.
J. R. M'CLEAN, ESQ., PRES. INST., C.E.
WILLIAM POLE, F.R.S., *Secretary.*

HIS GRACE THE DUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

J. Allport, Esq.

20 Feb. 1866.

JAMES ALLPORT, Esq., examined.

12,345. (*Chairman.*) You are General Manager of the Midland Railway Company ?—Yes.

12,346. Have you had an opportunity of looking at the evidence given before this Commission containing complaints against the Midland Company ?—I have.

12,347. Will you be good enough to favour the Commission with any observations you may think proper to make on the evidence as it affects your Company ?—Yes; the first evidence that I have observed in which the Midland Company is alluded to is the evidence of the first witness in the printed book, Mr. Charles Clark, of Liverpool, in which he speaks of the various rates from Liverpool as compared with other towns; and in replying to this evidence I think it will shorten the examination considerably if I state that there are many witnesses who allude to the low rates from Gloucester as compared with Liverpool. It is true that the rates are very low from Gloucester, and that is entirely owing to the exceptional circumstances in which Gloucester is placed. Gloucester is a very inconvenient place as a port. The expenses in reaching Gloucester for the shipping are very much greater than to Liverpool, or to many other ports. There is also canal navigation, which is expensive, and the Midland Railway Company have been compelled to charge exceedingly low rates to enable the Gloucester merchants to get into any of the Midland towns. I think that that will account for the low rates. It is brought as a charge against the Midland Company, that while they charge these low rates from Gloucester, they charge very much higher rates from other places; but the rates are given in the Appendix, and will be found at page 474. In answer to question 7, Mr. Clark states: "From Liverpool to Sheffield, about 73 miles, the "rate on sugar is 23*s.* per ton. From Hull to "Sheffield, 76 miles, it is 13*s.* 4*d.*" There again it is entirely owing to the peculiar position of Sheffield; there is a free water navigation to within a very few miles of Sheffield, and I believe the canal navigation dues to Sheffield altogether do not exceed about 1*s.* 6*d.* per ton from Hull to Sheffield, consequently it involves a very low rate if we are to get any portion of the traffic at all. And even at this low rate the bulk of the timber from Hull goes by water, a very small portion of it goes by railway. The general answer, of course, to Mr. Clark's statement, that there should be a uniform mileage rate is, that that would simply have the effect of destroying the railway communication altogether from Hull to Sheffield, as the railway companies could not carry all their traffic at such exceedingly low rates. In answer to question 67 put by the honourable member for Liverpool, he says, "I "have a letter here which I received from a gentleman "who is a very large shipowner, and a member of the "Mersey Dock and Harbour Board. It is a private "letter, from which I will read an extract. He says: "'The Staveley Ironworks Company had a large "'quantity of railway material to send out to India, "'and my firm made proposals for its conveyance to "'Liverpool, which arrangement would probably "'have been carried into effect, but on looking into "'the comparative cost of railway carrriage to "'London and Liverpool it was found that the goods "'would be sent to the former place for 3*s.* per ton "'less than the latter, while the distances are "'respectively, in round numbers, 170 miles from "'Staveley to London, and only 70 miles from same "'place to Liverpool.'" There is some mistake there, because the rate from Staveley to London is 12*s.* 6*d.* a ton, and from Staveley to Liverpool it is 10*s.* per ton, so that Liverpool there has an advantage, although I admit that the rate is very low to London, which is purely in consequence of the very cheap water con-

veyance from Staveley. Staveley is situated on the Chesterfield Canal, a few miles from where it debouches into the River Trent, and the rates are necessarily low.

12,348. (*Capt. Galton.*) What competition is there from London to Staveley by water; does the Trent at all assist that?—Yes; and there is a very large trade to London, which is shipped on the Trent at various places—at Keadby, at Goole, and at Thorne.

12,349. And it is so carried coastwise?—Yes.

12,350. It is found to be worth while to tranship the goods into a larger ship at the mouth of the Trent?—No, not at the mouth of the Trent; the goods are transhipped into coasting vessels at many of the smaller places on the Trent, Gainsborough for instance. Vessels of 300 or 400 tons will come up to Gainsborough, and many of larger size will come up to Goole. Sea-going steamers come to Goole from Hamburg, and there is a very cheap water conveyance from the whole of that part of the country to London.

12,351. I believe there are no tolls scarcely on the Trent?—I believe that the only toll on the Trent, as far as the navigation extends—to Burton-on-Trent—is only 1*s.* a ton.

12,352. (*Mr. Horsfall.*) Do you never take iron direct from the Staveley Ironworks the whole way by railway to London?—Yes, certainly; but I am accounting for the low rate that we charge for it. If we were to charge what I should consider even a moderate rate from Staveley to London we should get no traffic at all; it would all go by water, every part of it.

12,353. Still the fact remains that you do charge much lower rates from the Staveley Ironworks to London in proportion to the mileage?—Yes; and that is owing to the competition; on all parts of our railway we do that; but that I shall come to in a subsequent part of the examination.

12,354. The fact, as stated by Mr. Clark, is substantially correct, only you have assigned a reason for it?—No, it is not correct. Mr. Clark states in his evidence that the rate to London is 3*s.* per ton less than to Liverpool.

12,355. With reference to the inequality of the rates, is he not substantially correct?—No, on the contrary; the rate to Liverpool is 2*s.* 6*d.* less than it is to London, instead of being 3*s.* higher.

12,356. But, taking the mileage, he is substantially correct in his statement, is he not?—Quite so, if you take the mileage; but in estimating what the cost of the iron will be either in London or Liverpool, you do not take the mileage, whether it goes 1,000 miles or 10 miles; if the cost price is 2*s.* 6*d.* a ton less in Liverpool than in London, the Liverpool merchant has the benefit of that. It matters not to the merchant or to the shipper how far a commodity has been carried; the question with him of course is the cost price of the article when delivered on board ship.

12,357. (*Capt. Galton.*) Is it not possible that Mr. Clark's calculations have been made in this way, that he has added to the railway carriage the freight from Liverpool?—I think not; his words are, in answer to question 67, "On looking into the comparative cost "of railway carriage to London and Liverpool, it was "found that the goods would be sent to the former "place for 3*s.* per ton less than the latter, while the "distances are respectively, in round numbers, 170 "miles from Staveley to London and only 70 miles "from same place to Liverpool." He confines his remarks to purely the railway carriage. The cartage question I will leave. Then there is a question about the equality of charges, and I probably had better leave that question, because a great many of the witnesses deal with the equality of charges as Mr. Clark does.

12,358. (*Mr. Glyn.*) You propose to treat that question generally?—Yes, I think it will save much time. Then Mr. Clark is wrong in this; in answer to question 63, which is, "Are there not two lines of railway "belonging to two companies which lead from Liver- "pool to Leeds?" he says, "I think it is one; the "Lancashire and Yorkshire Company have a line to "Leeds." There are practically three or four routes from Leeds to Liverpool; there is one by the London and North-western, one by the Lancashire and Yorkshire, one by the Great Northern, Manchester, Sheffield, and Lincolnshire, and one by the Midland in connexion with the Manchester, Sheffield, and Lincolnshire, and all four routes are competing as between Leeds and Liverpool.

12,359. (*Capt. Galton.*) He says, in answer to question 66, "We cannot go to one company and "say, 'what will you take our goods for,' and then "go to another company and ask them what they "will carry them for, because they all charge the "same?"—Yes.

12,360. Mr. Horsfall then puts this question, "What you mean is, that if there were a dozen "railway companies, so long as such a combination "exists, no better terms can be made." He implies that there is no real competition?—There is no doubt that all competition by routes ultimately resolves itself into similar charges being made by two, three, or four different companies; it must inevitably come to that.

12,361. You mean that the railway companies agree as to what charge they shall make between Liverpool and Leeds?—Quite so.

12,362. (*Mr. M'Clean.*) And, generally speaking, they are reduced charges?—Not generally, for it has frequently happened that competition has brought about increased charges. I shall have occasion to mention several cases in which competition has really brought about increased charges, and one occurs to me at this moment, as between Nottingham and Derby. The Derby rates are in no case higher than the Nottingham rates, but they are in many cases lower. (*Mr. John Patterson's evidence referred to.*) I observe that a question was put to Mr. Patterson at 254, "Have you any reason to suppose that there "is any favouritism shown to certain persons in "these varieties of charges, or is the variation regu- "lated by any principle?" The answer is, "I think "it is regulated by some principle, but I cannot tell "you what that is. I think, however, that it leaves "it open to favouritism." The same remark applies to a variety of questions which were put to that witness. In my experience I may say that I do not know of any instance of favouritism that may be inferred from that answer; certainly not on the Midland line. I believe there is not an instance that can be brought against the Midland Company in which one trader has been favoured over another.

12,363. (*Mr. Horsfall.*) You do not say that a party sending a large quantity of goods does not get a lower rate than a party sending a smaller quantity.—Not from the same town, or where any particular trade is settled in a district, as the coal trade is in Derbyshire and in Nottinghamshire, or as the iron trade is in various parts of the Midland counties. Take, for example, the silk trade of Derby; we do not give a large trader a benefit over a smaller one; all parties in the district have the same rates. That was the principle adopted years ago by many of the large companies, but when I took the management of the Midland Company I abolished the system that was in operation there. I did not consider it fair to a man of small capital, because it was as much as he could do to contend with the large capitalists even at the same rates, and gradually all those differential charges were abolished with reference to persons in the same trade in the same district. I do not mean to say that if I took a truck of pig iron from Lincoln to a small station on the line, we should charge at the same rate as we should charge for a truck of pig iron from Staveley for a similar distance, because the circumstances would not be analogous. But if you take the Staveley ironworks, or the Clay Cross ironworks, or the Park Gate ironworks, they are in the same district, and the rates charged are the same to all those parties.

12,364. Is that the case at Burton?—Yes.

J. Allport, Esq.

20 Feb. 1866.

12,365. You do not give the large brewers there any preference over the smaller ones?—The Midland Company do not do so. Some years ago I am sorry to say that an arrangement of that kind was made, not by the Midland Company, but by the then manager of the London and North-western Company, and two large brewers had a great advantage given to them. The agreement was made without the knowledge of the Midland Railway Company, and the Midland Company fell in with it afterwards, but I expostulated with the parties about it, and ultimately the other brewers finding it out demanded to be put on the same footing as the larger brewers. The Midland Company at once assented to it, but to this day from that time the London and North-western Company have never participated in it, although they take the larger share of the proceeds. We gave drawbacks of seven years standing to all the small brewers, and placed them on the same footing as the two larger ones, Bass's and Allsopp's; there is no brewer at Burton, and in fact no trader, who is placed in an invidious position by our system. I may state that it is not with any desire to cast blame upon any neighbouring company that I have stated what I have; it was the system that was adopted at that time by many other companies, and it was generally thought that it was a correct system, but it is not so. (*Mr. Charles Clark's evidence referred to.*) Referring again to the evidence given by Mr. Clark, of Liverpool, I may observe that there are several discrepancies in his rates. In Appendix A I see that one rate is quoted "from "Bristol to Bradford, 26*s.* 3*d.*" It is 23*s.* 4*d.* "From Bristol to Leeds" it is quoted as "24*s.* 2*d.*" It is 21*s.* 8*d.*, and there are a variety of discrepancies of that kind, although I do not know that they amount to any great matter, but it is as well to be correct. A table which I will hand in represents the rates as given by Mr. Clark, and the distances, and also the actual distances and the correct rates. (*The following was handed in.*)

Between	Nature of Traffic.	Mr. Clark says		Midland Co. says	
		Distance.	Rate.	Distance.	Rate.
			s. *d.*		*s.* *d.*
Bristol - and Birmingham -	Sugar and Sundries	94	12 1	91	12 1 ctd.

12,366. The table handed in by Mr. Clark is substantially correct, with the few exceptions to which you have alluded?—There are a great many exceptions.

12,367. But not to any great amount?—No. (*Mr. John Patterson's evidence again referred to.*) In answer to question 228, in Mr. Patterson's evidence, he states, "A dealer in Derby who is in the habit of "attending our market stated recently to one of our "largest factors in Liverpool that he was unable to "buy a parcel of Indian corn that he offered to him, "because it would cost him 3*s.* a quarter to carry "it from Liverpool to Derby, whereas he could "carry it at the rate of 1*s.* 6*d.* from Gloucester, the "distance between the places being nearly the same." The name is not given, but it will be found in the subsequent evidence of Mr. Wheeldon of Derby, and he brings it as a very serious charge against the Midland Company. Now the Midland Company are not carriers from Liverpool to Derby, nor have the Midland Company a line from Liverpool to Derby, nor have they in fact to Manchester. A line is now in course of construction, but for years the Midland Company had very great difficulty in getting either to Manchester

or to Liverpool. I merely allude to that, because it is brought as a charge against the Midland Company.

12,368. (*Chairman.*) The traffic goes for a short distance over the Midland line, does it not?—It goes for a short distance over the Midland Railway, and probably it may be as well if I put that matter right now, although I should come to it in better order afterwards. It has been stated by three or four witnesses from Derby that the Midland Company are the only company there, and that there is no competition. That is not so. The North Staffordshire Company are at Derby by their own trains and agents, and they fix their own rates; we have nothing to do with what they charge over the line from Willington, which is a run of about six miles into Derby; and with regard to the rates either from Manchester or Liverpool, or from any part of the London and North-western line, it is just as much the property of the North Staffordshire as any other part of their system, and they fix the rates.

12,369. (*Capt. Galton.*) Can they make use of the line?—Yes; I think they had a lease of it for seven years, which expired several years ago, but we have continued it, and we are perfectly ready to make it in perpetuity, and if they like they may fix their own rates, and we shall take our mileage proportion after deducting the working expenses.

12,370. (*Mr. Glyn.*) Can the North Staffordshire Company give a rate to Derby to traders without coming to the Midland Company?—Yes; they have never come to the Midland Company; they have never consulted the Midland Company in any way whatever, and it has only been within a very recent time that we have been allowed rates from Liverpool to Derby. The London and North-western Company always refused to give us rates, until the Buxton line was opened, and from Derby to Manchester also. We never carried a ton of goods from Derby to Manchester after the opening of the North Staffordshire line until, I think, within the last two years and a half.

12,371. (*Capt. Galton.*) Until after the connexion of the North Staffordshire Company with the London and North-western Company had ceased?—No, not until after another route was opened. We have opened a route by way of Buxton in connexion with the London and North-western Company, which made a shorter route to Manchester and Liverpool than by the North Staffordshire route; and then the London and North-western Company, but not till then, gave us through rates; up to that time we carried nothing.* So that it is not the fact to say that the Midland Company only are at Derby.

12,372. (*Mr. Horsfall.*) I do not see in the question you have referred to that Mr. Patterson alludes to the Midland Railway Company?—No, perhaps not. He says, "A dealer in Derby," and I alluded to that incidentally, because that dealer subsequently gave his evidence. I mean Mr. Wheeldon, and he gives, I think, the letter which he had written to Mr. Patterson.

12,373. It does not follow that Mr. Patterson alluded specially to the Midland Company. I rather gather from his evidence that he did not allude to the Midland Company?—Probably that may be so. I do not know. I referred, however, to this question, because it bears upon the subsequent examination of two or three gentlemen from Derby. At question 267, Mr. Patterson is asked, "Can you give any other "illustration of this system besides the case of Hartle-"pool?—Yes, Morecambe, which is used by the Mid-"land Railway Company for the purpose of carrying "at lower rates than those from Liverpool." Then at question 271 he is asked, "What difference in the "rate charged is there between Morecambe and places "at equal distances as compared with Liverpool?—"From Morecambe to Manchester the distance is 56 "miles, and the rate is 8*s.* 4*d.*, while at the same time "the rate from Liverpool to Manchester, which is a "distance rather under 32 miles, is 8*s.* 4*d.*" That does not apply to the Midland Company. The London and North-western Company are at Morecambe, and they charge what rates they think proper; we have nothing whatever to do with those rates from Morecambe to Manchester, although the port at Morecambe belongs to the Midland Company; the dock and the railway belong to them; but the London and North-western Company are in the same position at Morecambe that the North Staffordshire Company are in a Derby.

12,374. (*Earl of Belmore.*) Has the Midland Company no railway to Morecambe?—It is the Midland Company at Morecambe; but the London and North-western Company have rights there, and they fix their own rates.

12,375. (*Capt. Galton.*) The Midland traffic, I believe, goes to Morecambe along the Skipton line?—Yes, entirely.

12,376. (*Mr. Horsfall.*) It is still the Midland Railway, although the rates are fixed by the London and North-western Company?—Yes, it may be turned into a charge against the Midland Company for making those rates, but if I was manager of the London and North-western railway I should be prepared to defend that rate, because I think it is perfectly defensible; my object, however, is to show that it is not the Midland Company that fixes the rate. In fact, it seems to me that there is a very strong desire on the part of the Liverpool gentlemen to absorb nearly the whole traffic of the kingdom, for they are not satisfied with what they have got. In Appendix B., the exports from Liverpool are set out, and there has been great complaint about the low rates to Gloucester, but I find that poor Gloucester has not more than about 46,000*l.* worth of exports, whereas Liverpool has 64,000,000*l.*, and yet they are not satisfied.

12,377. (*Lord Stanley.*) Do you consider it the duty of a railway company to endeavour so to regulate the trade as to distribute a certain share to each town in such manner as seems to them just, or is it not rather their business to take such traffic as may be offered to them without asking any further questions?—I think it is the duty of managers of railways to develop the resources of their districts to the utmost possible extent; that is the principle that has influenced me. If I saw an opportunity of developing a trade at Gloucester, so long as the rates left a profit, I should most undoubtedly endeavour to do it, without reference to the rates from Liverpool or London, or elsewhere; the only question would be whether the rates would leave a profit. I think it is the duty of railway managers, both in the interest of the companies and of the public, to do so, and it would, in my judgment, be a national calamity if the whole trade of this country were to be concentrated in one port, which is what the Liverpool gentlemen would certainly bring about if their views were to prevail.

12,378. What have you to do with its being a national calamity, if trade is concentrated in one port? Is it not the business of a railway company to carry as much as they can get to carry, and to make as much profit as they can?—Yes; but I spoke just now, as a member of the community at large, and perhaps I should not have done so. I certainly do consider it my duty, as manager of the Midland Railway to develop the resources of the district to the utmost extent that I can.

12,379. (*Chairman.*) Is it the interest of the railway company to develop the traffic which requires encouragement?—Quite so, and if we did not do that, what would be the effect? Take, for example, the case of Derby; from Gloucester to Derby the entire line belongs to the Midland Company, and I apprehend there is nothing in any of our Acts to prevent the Midland Company from carrying traffic from Gloucester to Derby at such rates as it pleases, provided they are within the maximum of their parliamentary

* I may also state that for a time the North-western Company sent the Liverpool traffic for Derby *viâ* Buxton and the Midland, which is the shortest route, but they have recently taken it away from us, and told us it is not their intention to send it *viâ* Buxton, but *viâ* the North Staffordshire route.

J. Allport, Esq.
20 Feb. 1866.

tolls. With regard to fixing rates it will probably be better that I should explain how they are fixed. A timber merchant at Gloucester would write to me, and he would say, "I can do a trade at Derby, but your "rates are so high that I cannot get into the market. "If you can reduce your rates 1*s.*, 2*s.*, or 3*s.* a ton, I "can put a trade upon your line which will be a "benefit both to you and to me." My business then is to inquire whether that statement is correct, and if I find it is correct I give him a rate, and the result is that he brings traffic upon the line.

12,380. (*Lord Stanley.*) May it not be put in this way, that as long as your charges are within your maximum parliamentary tolls, and you only charge what the law of the land entitles you to charge, no one town or community has any right to complain because you happen, with a view to your own advantage, to charge a lower rate to another ?—That is my view of it.

12,381. You put it simply on a commercial ground, and not with reference to holding the balance evenly between one place and another ?—Yes ; the question simply is, Is there a trade to be had; are the rates remunerative, and can we do it. Those three questions being answered in the affirmative, we carry the traffic.

12,382. (*Mr. Glyn.*) Your object is to make a profit ?—Yes.

12,383. (*Mr. M'Clean.*) And that profit varies upon different articles ?—Yes.

12,384. On some articles you obtain 10 per cent., while on others you obtain 20 and 30 per cent. ?—Yes, taking the average of our rates, and probably you may put the working expenses of the Midland Railway, including all charges, at 50 per cent., but we carry a great deal of traffic costing us probably 80, 85, or even 90 per cent., but so long as there is a profit we are willing to carry it. (*Mr. Hilton Halhead's evidence referred to.*) I find that Mr. Halhead, in answer to question 427, says, "From Liverpool to Burton-on-"Trent the distance is 90 miles, and the rate charged "is 15*s.* a ton. From Hull it is 122 miles, and the "rate charged is only 9*s.* 8*d.* From Hartlepool the "distance is 154 miles, and the rate charged is 10*s.* 10*d.* "From Bristol the distance is 125 miles, and the rate "charged is 12*s.* From Gloucester the distance is "87 miles, and the rate charged is only 7*s.*" That is perfectly true, and the same explanation applies to that. Burton is very favourably situated as to water communication for Hull, Grimsby, and Hartlepool, and the whole of the east coast. But Mr. Halhead in his evidence makes mistakes as to the distances. For instance, he says, "From Hull to Burton the distance "is 122 miles," whereas it is actually only 105 miles. I apprehend that the route he has taken is by way of Normanton, but the route the traffic takes, and upon which we base our rates, is the one by the Manchester, Sheffield, and Lincolnshire line, by Lincoln.

12,385. (*Mr. Horsfall.*) What is the actual distance by railway ?—105 miles.

12,386. Still the fact remains that a lower rate is charged for a longer distance ?—Yes.

12,387. (*Capt. Galton.*) The traffic is not upon your line ?—Not from Liverpool to Burton.

12,388. The low rate is charged upon your line, and the high rate upon the other lines ?—Yes ; No part of the line belongs to the Midland Company from Liverpool to Burton, excepting a few hundred yards. The North Staffordshire line comes to our station, they fix their rates, and they pay us for the use of the station. I think it is half a mile or a mile toll.

12,389. The rate from Gloucester is fixed by your company ?—Yes, it is fixed by us entirely. (*Mr. Charles Stead's evidence referred to.*) I observe that Mr. Stead, whose examination commences at 437, speaks very favourably of his arrangement with the Midland Company ; but there is one question which evidently led the Commission into error. He speaks of the value of the traffic from his works at Saltaire to Manchester as 70,000*l.* per annum.

12,390. (*Capt. Galton.*) I think he stated that he received goods of the value of 60,000*l.* or 70,000*l.* per annum ?—Yes; but in answer to a subsequent question (508), "The practical result of your agreement is, "that the Lancashire and Yorkshire Company lose "the whole of your traffic from Manchester ?" he says, "Yes, the whole of it ;" and in answer to question 509, "Do you know what it amounts to in "value ?" he says, "It is certainly not less than "70,000*l.* a year ;" the fact being that the entire traffic from Manchester to Saltaire amounted in a year to 457*l.* Mr. Stead also alludes to the difference of rates, and it is very difficult to follow these witnesses, because in frequent cases they are not comparing the same commodity, for instance, Mr. Stead is comparing the rate from London to Saltaire, or from London to Bradford, which is upon the raw material, with the rate evidently for manufactured goods as between Saltaire and Manchester. In answer to question 459 he goes on to give the rates downwards from London to Saltaire, or London from Bradford, from Manchester and Liverpool, but he is not comparing the same commodities. After the manufacture of the raw material, of course it becomes more valuable ; there is more risk attending it, and the rates are higher, according to the classification ; and all I wish to say is that the evidence is calculated to mislead the Commission. (*Mr. John S. Wright's evidence referred to.*) Mr. Wright, of Birmingham, in answer to question 628, states, "Our "rate to London is 27*s.* 6*d.* per ton ; to Sheffield, "which is a less distance, it is 40*s.* per ton." Mr. Wright is altogether mistaken.

12,391. He speaks of the low rate from Birmingham to Bristol, and of the high rate upon the same article from London, he says, "Molasses, for instance, an "article that is used in Birmingham, both for manu-"factures and for food, is brought at 12*s.* 1*d.* from "Bristol ; but from Liverpool it is 16*s.* 8*d.* Molasses "and sugar are both in the same category. From "London the rate is 21*s.* 8*d.*" ?—He says that "on "hardwares our rate to London is 27*s.* 6*d.* per ton ; "to Sheffield, which is a less distance, it is 40*s.* per "ton." The rate for hardwares from Birmingham to Sheffield is 17*s.* 6*d.* a ton instead of 40*s.*

12,392. (*Chairman.*) Has that been so for some time past ?—Yes, for years. But there again, unfortunately, the witness is comparing two different articles, which I shall have occasion to call attention to repeatedly in the evidence. It is true that we have a rate of 35*s.* per ton, not 40*s.*, as stated, between Birmingham and Sheffield, but it is for cutlery and other valuable manufactured goods, articles of very different value as compared with hardwares. I may state that for steel, which is a staple commodity of Sheffield, we have very low rates—much lower rates upon steel from Sheffield to all the ports of the kingdom than we charge upon steel in other places ; for instance, Birmingham is not a steel manufacturing place, and our rate for the carriage of steel from Birmingham to London would be higher than for the carriage of steel from Sheffield to London, because there it is a staple commodity. But as hardware is the staple of Birmingham, Birmingham gets the benefit of it, and Birmingham is charged 25*s.* per ton for hardwares instead of 40*s.* per ton.

12,393. (*Capt. Galton.*) But that, Mr. Wright states, is the charge for a much higher class of goods altogether ?—Yes, a much higher class of goods. Then he goes on to state, "For the same class of goods "we pay 15*s.* 5*d.* per ton against from 21*s.* to 23*s.* to "Liverpool, or 40*s.* to Sheffield." The same remarks will apply from Bristol to Birmingham ; there is a cheap Severn navigation up to Worcester and Stourport, and there is a very cheap canal navigation to Birmingham, which compels very low rates from Bristol to Birmingham.

12,394. (*Mr. Horsfall.*) Is that navigation included in the rate that you charge ?—We charge by the railway.

12,395. Does your rate include the navigation

charge as well?—Comparing the Liverpool to Birmingham rate with the Bristol to Birmingham rate, the distance being about the same, there is great discrepancy in the rates. I am accounting for the low rates from Bristol to Birmingham by the cheap water communication existing between the two; there is a continuous cheap water communication between Bristol and Birmingham, and we charge low rates.

12,396. (*Chairman.*) And you would get no traffic if you did not?—No; and the same remark applies to a great many other things; he speaks of molasses and bacon.

12,397. (*Sir R. Hill.*) Is there not water communication in both cases?—Yes; but it is canal navigation the greater part of the distance from Liverpool. It is river navigation to Preston Brook; but from that place to Birmingham it is entirely canal navigation; whereas from Bristol to Birmingham it is a free navigation for nearly the whole distance, or nearly free.

12,398. How far is it free?—Either to Worcester or to Stourport. There are two canals; the Staffordshire and Worcestershire canal, which runs from Staffordshire to Stourport, and there is the Birmingham and Worcester canal, which falls into the Severn at Worcester. By either route they can get a very cheap rate from Bristol or from Gloucester to Birmingham. Up to the present time Bristol has been very disadvantageously placed; the tendency for the last few years has been to increase the size of all seagoing vessels. Bristol is on the Avon, and the expense of getting up is very great, in consequence of which many large shipowners will not send their ships to Bristol, but rather to London or to Liverpool, or Newport, and that is operating very disadvantageously on our traffic from the Severn ports. There is a little discrepancy in Mr. Wright's statement about the rates. He says that the rate upon copper from "Swansea to Birmingham is 18*s.* 2*d.*," it should be 16*s.* 8*d.*; and from Plymouth, "25*s.* 9*d.*," it should be 25*s.* He also states that glass from Birmingham is a very important trade, and he says that the rate to London, to St. Helens, and to Birmingham, is about the same. From Sunderland to London it is 32*s.* 6*d.*, from St. Helens it is 30*s.*, and from Birmingham it is 27*s.* 6*d.* There is a discrepancy about those rates. In answer to question 633, "That is to say the rail-"way companies do not allow two or three different "persons to combine to send their goods in one box;" he says, "No, they do not allow one manufacturer "sending three different articles, tubes, brass wire, "and iron wire, to one party, so to send them, but "they will be divided; the whole would be charged "per cwt. 2*s.* 6*d.*, but it will be divided into two or "three parcels, and the railway company will charge "separately for those parcels, thereby doubling the "rate of carriage on that particular cwt. of goods." If there were several bundles of brass wire going to one party they would not be charged separately.

12,399. (*Capt. Galton.*) Should you not charge them according to the highest class in that case?—No, not according to the highest class; suppose, for instance, there were 50 bundles of brass wire, we should charge them all together in the class in which the brass wire appears. We should not weigh the brass wire and the iron wire together and charge them at the same rate, but we should charge the iron wire at a lower rate than the brass wire and the tubes.

12,400. If you had brought to you a bundle of iron wire, or three separate articles, each of which individually would be charged for according to the rate fixed for "smalls," but, the three being combined, would they be charged according to the tonnage, or how should you deal with them?—If they were distinct articles, and not the same description of goods, we should charge for them separately, because they would appear in separate classifications altogether.

12,401. (*Earl of Belmore.*) If they were packed together in one box, would you take them as one box?—If the manufacturer packs them in one package, they go as one package, and then they are so charged, whatever the package may contain.

12,402. (*Capt. Galton.*) Mr. Clark stated that if they were in one parcel, the highest rate would be charged.—I think that is not correct. The practice, I think, is uniform; if there are different qualities of goods, we charge according to the class of each; take 1 cwt., 2 cwt., or 3 cwt. of iron, and a merchant also sends 2 cwt. or 3 cwt. of brass to the same individual, we should not put the two together and charge the highest class for both, but we should charge a rate according to the classification. We should charge the brass according to its classification, that being a more valuable commodity than the other. In answer to question 646, Mr. Wright, I think, would rather lead the Commission to suppose that the Worcester canal is a very unimportant means of competition with the railway, and that its wharf is outside the town. I have known the Worcester wharf all my life, and I know that it is a very short distance from the centre of the town, and so far from its being outside the town, as compared with our goods station in Birmingham, it is fully half a mile nearer the centre of the town than our station.

12,403. (*Capt. Galton.*) That, I believe, is the rule relating to "smalls"? (*handing the same to the witness.*)—Yes, but the goods that Mr. Wright alludes to in his evidence are not "smalls;" he is alluding to tubes and iron wire, and brass wire, and those articles are not sent in small quantities, and therefore not affected by that rule; they are always sent in large quantities. Suppose a man has 10 lbs. of brass wire and 15 lbs. or 20 lbs of iron wire, and a small lot of gas tubing, amounting to 30 lbs. or 40 lbs., then those three "smalls" would be put together and charged at one rate, and not according to the rule that I have been alluding to, where there were several cwt. of each. These tubes are sent in very large quantities.

12,404. You were alluding to goods that would be very heavy, and be charged according to a class rate?—Yes; quite so.

12,405. (*Mr. Horsfall.*) Does not Mr. Wright draw a distinction between the Worcester Canal Company and the old Birmingham Canal Company?—Yes. The Birmingham canal wharf and the Worcester canal wharf are within 200 or 300 yards, less probably, both of them being centrally placed, and as conveniently placed for the town as they well can be.

12,406. Mr. Wright states that the Birmingham Canal Company had the fixing of the rates, and not the Worcester Canal Company. Is that so?—No; certainly not. In answer to question 645, "Have any "of these railway companies in Birmingham made "themselves owners or lessees of any of the canals," he says, "There are several canals that are now owned "in our neighbourhood by railway companies, and "with others they have made arrangements by which "practically we have to pay the same rates by the "canals as we do by the railways. For instance, the "Shropshire Union Canal belongs to the London and "North-western Company. They bring goods from "Liverpool to Birmingham." Now, it is perfectly true that the old Birmingham canal is guaranteed by the London and North-western Company, and it practically belongs to them, but that does not apply to the Worcester canal. He says: "The Worcester and "Birmingham Canal is free from railway control, but "that only comes to the confines of Birmingham, for "to come into the town it would have to pass over "the old Birmingham canal, which is in the hands of "the London and North-western Company, and conse-"quently they fix such rates as prevent competition."

12,407. Is that so?—Not at the town of Birmingham. It may be so going forward from Gloucester or Bristol to Wolverhampton or to Liverpool, or any part of that district. Of course the Birmingham Canal Company would have had a voice in fixing the rates through from Worcester to Wolverhampton, but certainly not from Worcester to Birmingham; it passes over no part of the Birmingham canal.

J. Allport, Esq.

20 Feb. 1866.

12,408. Mr. Wright states that it does ?—Yes ; but with all deference to Mr. Wright I fancy I know that that is not correct.

12,409. (*Chairman.*) Then Mr. Wright is mistaken in the answer given to question 646, "Has not the "Worcester Canal Company got a wharf of its own "in Birmingham ?—On the outside of Birmingham "they have ;" and also in the answer given to question 647, "Is it not very near the centre of Bir- "mingham ?—No ; there the old Birmingham canal "begins."—Yes ; he is quite mistaken. The two canal wharves are very close together, but the Worcester canal is the most central in the town of Birmingham. I come now to a very important answer given by Mr. Wright to question 278 : "Can you "suggest any reason for that difference ?—The best "I think that I can give to that question is one that I "believe was given by the chairman of the Midland "Railway Company some time ago to parties who "were largely interested in the trade of Sheffield. "The Sheffield people, I believe, had complained very "much of the high rates to Sheffield, the matter "being entirely in the hands of one company from "Birmingham, and he said—this appears as a quota- "tion—'although we are obliged on various occasions "'to compete and to charge very low rates, where "'we have the power of charging a high rate we are "'obliged to do so, and we take advantage of that in "'order to make up a dividend for our shareholders.'" I am glad to say that he merely says, "I believe." I have questioned the chairman of the Midland Company, and I was very much struck with the answer of the Chairman ; he denies ever having made such a statement.

12,410. Does this necessarily refer to the present chairman of the Midland Company ?—It may not refer to the present chairman, but I have mentioned it also to the late chairman.

12,411. (*Capt. Galton.*) Your policy is totally opposed to it ?—Perfectly so.

12,412. You fix your rate according to the price the goods will bear in the market ?—Yes. Then at question 683 he is asked, "Can you at all account for the "differences in charge ?" The answer is, "No ; "save that the Midland Company, in certain districts, "charge very low rates. We have no complaint to "make about the rates from Bristol and that district "to Birmingham. To Sheffield, on the contrary, they "charge very high rates, as compared, for instance, "with the rates from Newcastle, the goods coming "over part of their line, and the rates from Hartle- "pool, which are very much lower than the rates "from Sheffield." That is, lower per mile, but not lower in the aggregate from Newcastle. From Newcastle to Birmingham the distance is upwards of 200 miles, but from Birmingham to Sheffield the distance is much less. I assume that Mr. Wright must have given that answer on the supposition that he was correct in stating that the rate to Sheffield was 40*s.* as compared with 27*s.* 6*d.* to Liverpool. Mr. Wright also refers to the classification of goods, and probably that had better be deferred. Mr. Wright also complains, in answer to question 725, as to "travellers' "patterns." We have done all that we consider they could reasonably expect ; we charge half the rates that are charged for ordinary passengers' luggage, and if we did not do that, we should never get our passenger trains through. If we charged the same as for passengers' luggage, the passenger trains would never get through the country ; there would be so many goods taken with them as patterns if we made no charge at all, or the same charge as for ordinary goods, and we therefore charge half the ordinary passenger rate for excess of luggage. We consider that that is a very great boon to the traveller, because he can take his patterns with him at a very moderate charge. Mr. Wright also speaks about shifting the goods from one class to another. That is a very rare occurrence, but it does occasionally happen, as I shall have occasion to point out subsequently. In answer to question 753, after complaining so much of the railways, he acknowledges that "in Birmingham, within the "last 30 or 40 years, a very large number of new "trades have been developed, which has caused a "very great increase in the amount of goods carried." I may say that I know of no town which has improved under the railway system more than Birmingham has, and so far from having occasion to complain of them, I think it has every reason to congratulate itself that it is in so good a position. The trade of Birmingham, and the population returns will show it, has increased probably to a larger extent than in almost any town of about that size in the kingdom.

12,413. (*Mr. Gower.*) I suppose they do not complain of the existence of railways, but that they do not derive so much benefit as they might from them ? —It appears to me that they would rather confiscate railways for the sake of their own private benefit ; that seems to be the general argument. Mr. Wright also complains about glass ; he speaks of the low value and the high rate. We have two rates, one at the owner's risk and the other at the Company's risk. It is notorious that brittle articles are so treated ; they are liable by railway carriage to considerable breakage, and the Company has to satisfy very considerable claims for broken glass. I am not aware that the rate is to be complained of ; it is a very low rate from Birmingham to Bristol ; and there again we have put Birmingham, it being a staple trade, upon a very low scale of charge ; it is sent from Birmingham to all parts of the kingdom in considerable quantities, and so satisfied are the Birmingham people, as I apprehend, with our rates, that in one or two places we have built for them warehouses, especially for glass ; at Bristol we have gone to a very considerable extent in providing warehouse accommodation exclusively for glass.

12,414. (*Capt. Galton.*) You charge a low rate if not liable for the breakages, and a high one if you are ?—Yes.

12,415. And the trade prefer to carry at the lower rate and take the risk upon themselves ?—Sometimes the one, and sometimes the other. (*Mr. Charles Dickenson Sturge's evidence referred to.*) Mr. Sturge is the next witness, and he complains, in answer to question 785, of the Midland Company not giving such facilities as he thinks they should do, and speaks of the increase in the value of land in the neighbourhood of King's Norton. My answer to that is, that we run five trains each way per day to King's Norton, which is not a large place, and in that neighbourhood until a recent period there has been very considerable difficulty in obtaining land. The Baroness Windsor would not sell any land for building purposes. I admit that it is a very beautiful district, and if land could be readily obtained, it would be the interest of the Midland Company, and I am sure they would avail themselves of it, to encourage the building of suburban residences ; but there has been a very considerable difficulty until recently in getting land at all. There are two or three landowners there who have hitherto refused to part with their land, the Baroness Windsor especially, and she probably has the best sites for residences.

12,416. (*Chairman.*) Mr. Sturge states, "But on "the Midland line at the first station, King's Norton, "which is at a distance of seven miles, land was sold "a year or two ago at 60*l.* an acre, and near the "station more recently at 80*l.* an acre ?"—I am surprised to hear that statement as to 60*l.* and 80*l.* an acre, because the Midland Company had recently occasion to buy a little land at King's Norton, and they had to give 800*l.** an acre for it.

12,417. (*Sir R. Hill.*) Do you know how much the land there has increased in value since the railway was constructed ?—Not positively ; but I have no doubt that the land in the neighbourhood of King's Norton must have trebled in value at least since the railway was constructed.

* This sum was afterwards altered by the witness to 500*l.*

12,418. (*Lord Stanley.*) When you speak of land selling at 800*l.* per acre, do you mean ordinary agricultural land, or land to which a residential value has been given by the line passing near it?—No; we have recently bought land at that price where there are no residences, and we are now negotiating for an ordinary grass field; we have offered the man 500*l.* an acre, but he will not take it; there is no house near it.

12,419. (*Sir R. Hill.*) How near to the railway is it?—It is adjoining the line. We want it for railway purposes, and we shall have to give him more than 500*l.* an acre.

12,420. (*Mr. Horsfall.*) That is probably in consequence of the owner knowing that you must have it?—If we were to put it into an Act, a jury would give him what they considered its value, but if land can be sold in the neighbourhood of King's Norton station for 60*l.* an acre, I am sure that no jury would give him 500*l.* an acre.

12,421. (*Chairman.*) Mr. Sturge, in answer to question 788, says, that the land has not increased in value at all near the Midland station?—If the land is of so little value, I cannot understand how it is that people do not avail themselves of it, because there is between Birmingham and King's Norton an excellent turnpike road, and the country is full of population for the entire distance; the railway does not go so near as the turnpike road in some places, and for the accommodation of the public there are a number of omnibuses running throughout the day between King's Norton and Birmingham; it is a very short distance. I observe that Mr. Sturge rather praises the Midland Company for their low rates, but he says, in answer to question 813, "Are the delivery trucks fully laden "on the line for transmission to Gloucester?—The "railway companies send down the trucks by an "engine, and then they have one or two horses which "are used to move them to the warehouses, after "which they have nothing further to do with them "than to receive a consignment note." The object of this evidence is to show that there is no terminal charge at Gloucester. At question 808 he is asked, "Have you seen that memorial?—Yes, I have a copy "of it here, and there is one important point. They "approve of 2*s.* per ton for terminal charges, that is "1*s.* a ton at each end; but they do not seem to be "aware that in Gloucester the merchant loads the "trucks, and they never go into the station at all; "the whole of the loading is done by the merchant, "and consequently there is a very slight terminal "charge made." Then, in answer to question 813, he states, "The Railway Companies" (Midland) "send "down the trucks by an engine, and then they have "one or two horses which are used to move them to "the warehouses." It so happens that we have 27 horses employed to do this work, and we generally hire six horses throughout the year, sometimes on one day perhaps none, then the next six or eight, the next day 10 or 12. On the average we hire about six horses in addition to our own, and a very expensive operation it is. At Gloucester the engines do not go down to the docks, and the traffic has to be taken from the docks down to the railway, a distance of a mile and a half or a mile and three-quarters, hence the number of horses we are obliged to employ, but so far from being a trifling expense it is a very heavy one. Mr. Sturge also advocates a uniform rate.

In Appendix O., I find the statement of Lord Ashtown's colliery agent; and he says—"The natural "difficulty I maintain railways are designed in part to "overcome, and Government are acting in the right "direction in inquiring how they can be conducted so "as to serve the best interests of the people. The "people who live in the south and eastern counties can-"not compete with their countrymen in the north. A "brass founder in Birmingham loses a profit which a "brass founder at Sheffield gains in the very outset of "melting his metal in the price of coke; at Leeds the "brass founder can buy his gas coke for the furnace at "5*s.* 6*d.* per ton. At Sheffield 8*s.*; at Birmingham 15*s.*" I rather gather from this statement that he wishes it to be inferred that the price of coke in Birmingham is owing to the railway companies, and that Government should take some steps to put Birmingham more upon an equality with Sheffield or Leeds. It happens, unfortunately, that Birmingham is so placed that there is no coal suitable for coking purposes. The whole of the coke going to Birmingham has to be sent from very long distances, and the rates are exceedingly low. We are taking coke to Birmingham from Derbyshire at as low as a halfpenny per ton per mile, and I think that that is a moderate rate. I may state that the gas companies in Birmingham are now getting their coal from Derbyshire in consequence of the inferior quality of the Staffordshire coal for that purpose, but no blame can be attached to the railway company for that.

I observe in Appendix Q., that there is a complaint made by the Rev. James Field as to "want of cor-"respondence of trains on different lines in the midland "counties." He complains of a train not being able to get from Leicester to Northampton by way of Market Harborough, and states that the trains are badly arranged, purposely to prevent people from travelling that way. He must know very little of the system upon which these trains are arranged. The London and North-western Company from Market Harborough to Northampton must fit in their trains with their main line, and the Midland Company must do the same; and it is one of the most difficult things in railway management to fit branch trains in with two or three different main lines. It is almost impossible. It is perfectly true that the trains do not fit so well at Market Harborough as the public generally might think desirable, but it is entirely owing to that fact. The London and North-western trains running from Scotland or Liverpool to London must have branch trains to meet at Blisworth, and they must leave Market Harborough at a certain time. The Midland Company have connexions from the north at Normanton, and at various places their trains are timed on the main line, Market Harborough being on the main line of the Midland as to through traffic. If this gentleman had studied Bradshaw a little more he would have found that to get from Leicester to Northampton, if by way of Rugby, where the Midland line runs into the London and North-western main line, he would have found abundance of trains.

12,422. (*Capt. Galton.*) Would the charge be the same?—Yes, by both routes; but that is an incident that I do not see how it is possible to avoid.

12,423. (*Mr. Horsfall.*) Is there no truth in the generally received opinion that a jealousy exists between different companies as to trains meeting on a line?—There may be in one or two instances a little truth in it, but I can safely say that in the case of all the larger companies there is no foundation for such a statement. If you will take the London and North-western Company, the Midland, and the Great Western, you will find that the trains are made to suit the bulk of the traffic, and some inconveniences must necessarily arise. I will exemplify this by giving an instance of the Midland Company's trains from Bristol to the north. At Bristol we endeavour to fix our trains so as to be in connexion with the Bristol and Exeter trains coming from the extreme west—from Cornwall and Devonshire. We come to Gloucester, where we again meet the South Wales system; we come to Worcester, where there is a third system of the Great Western Company from London on the one hand, and from Hereford, Newport, and all that district on the other. We come to Birmingham, where we meet the London and North-western trains from a variety of places, and then to Burton where we are in connexion with the North Staffordshire line. At Derby we are in connexion with our own line to the east, and to various places. At Eckington we are in connexion with the Manchester, Sheffield, and Lincolnshire line; at Normanton, with the North-eastern line; and at Oakenshaw, with the Lancashire and Yorkshire line. I have mentioned these several junctions in order to show how impossible it is to fit a train running from Bristol to the north with all these various branch connexions,

J. Allport, Esq.
20 Feb. 1866.

the main lines having far more important sources of traffic to accommodate than the few passengers who may wish to exchange from the branches. Practically, I think, there is very slight foundation for the public opinion, which I know is general, that railway companies purposely fix their trains so as to avoid meeting each other conveniently.

12,424. Take the two lines to which you have just alluded, the London and North-western and the Midland. A Midland train arrives at the junction at Lichfield with the Trent Valley line?—At Tamworth; we do not run to Lichfield.

12,425. But the South Staffordshire Company regulate their trains by yours, and your train leaves Lichfield five minutes before the train arrives from Liverpool?—I have no doubt that it is so, as you state it, but I was not aware of the fact.

12,426. There are several such cases?—I have no doubt it is so; but you will see, I think, at once, how impossible it would be for the Midland company running their trains to Derby from the north in connexion with the North-eastern Company from Edinburgh, Newcastle, York, and all that district, to do otherwise than they do. We cannot leave Normanton before their train arrives; they fix their own times, not with reference to the Midland trains, but with reference to the Great Northern trains through to London. From York to Normanton happens to be a branch of the North-eastern Company's line joining the Midland, and we depart from Normanton as soon as we can, that is, as soon as the North-eastern train arrives; but it never occurred to me to fix our trains leaving Lancaster, Leeds, and Bradford, with a view to fit into the London and North-western train at Lichfield to carry a passenger to Liverpool. It is too unimportant to justify the throwing out of gear, as I may say, the entire passenger traffic along the main line, from the north to Bristol on the one hand, and to London on the other.

12,427. (*Mr. Glyn.*) I suppose the principle you act upon is to accommodate the greater number?—Yes.

12,428. And to make the best provision for the larger traffic?—Yes.

12,429. (*Mr. Horsfall.*) I have been speaking of the South Staffordshire line and the Midland, the line running from Derby to Birmingham?—The trains from Derby to Birmingham are in connexion with the trains from the north. They do not start from Birmingham, except one or two early in the morning; the great bulk of the trains are in connexion with those coming either from the east, from Lincoln and London on the one hand, and from Leeds, Bradford, and the North on the other.

12,430. The South Staffordshire trains start from Derby?—No, they are the Midland trains. The South Staffordshire carriages are attached to the Midland trains at Derby, and they are detached at the Wichnor junction, and carried forward to Wolverhampton; the great object of those trains is to accommodate the traffic going to the towns in that district—Lichfield, Walsall, Wolverhampton, Dudley—and so on. It would of course be so much better if the trains could just fit in at Lichfield, to enable a solitary passenger to go forward to Liverpool.

12,431. (*Capt. Galton.*) Your trains at Leeds do not always accommodate the trains of the North-eastern Company which arrive at Leeds from the north?—At Normanton we do; we do not consider Leeds the point of junction with the North-eastern.

12,432. So that passengers who come from places between Thirsk and Leeds are most unfortunately thrown out?—Yes, they are sometimes; but you will see that between Thirsk and Leeds it is a very unimportant district as compared with Edinburgh to Newcastle, and York to Normanton, and there the small number of passengers must give way to the larger, and you will find that all our trains are arranged to fit in with the North-eastern trains at Normanton, which is by far the most important connexion of the two. At Thirsk the North-eastern train comes up from Newcastle to Thirsk, and it is there divided—it is perhaps an express train—at any rate, all their trains run faster as between Thirsk and York and Normanton than between Thirsk and Leeds; they endeavour to accommodate the district by calling at more stations between Thirsk and Leeds than between Thirsk and Normanton. Our trains are fixed with reference to those coming to Normanton, and we have to leave Leeds before the Thirsk portion of the train arrives, or we should keep all the northern passengers waiting at Normanton a considerable time.

12,433. (*Mr. Gower.*) Are you able to state that you fix the time of your trains solely with reference to the convenience of the public, and never with reference to driving the traffic in one direction rather than in another?—Yes. I go through these train arrangements monthly, and I can say most emphatically, and without fear of contradiction, that for many years past no train has been fixed on the Midland Railway with a view to obstruct passengers going in any direction they may think proper.

12,434. (*Chairman.*) In the early periods of the railway system was that practice adopted?—Probably it was, but it must have been many years ago. I do not think that any of the larger companies have done it for years past. It may be done now by some of the smaller companies, but I think it will be seen that it is too small and unimportant a matter to make it likely that a large company like the Midland, or the London and North-western would do it. The traffic is not large enough to justify such an obstruction to the public using the lines.

12,435. Are there not occasionally considerable inconveniences and detentions on branches of your own line?—Yes, there are, and we find the same difficulties. The line from Burton to Leicester is one; the great bulk of the traffic passing over it is either from Burton to Leicester, or from the North Staffordshire line, going from west to east, and great complaints are made that even our own trains do not fit in well at Burton to take passengers forward. We fix our trains, as will be seen by reference to the Midland time table, to suit the North Staffordshire trains on the one hand and the Great Eastern trains on the other. There is the line from Burton to Peterborough, and a very considerable traffic flows over it between the east and the west; that is one case, but there are many others on the Midland system where passengers are frequently inconvenienced because the trains do not fit in well.

12,436. Is there not another grievance—do not passengers complain that trains are advertised to fit in, and that they scarcely ever do, so that when they arrive at a station, and expect to be carried forward, they find the train has started half an hour before?—That will happen, it matters not who has the management of a railway; it must inevitably happen, and there are a variety of causes for it. For example, a heavy wind or a slight rain will sometimes make the rails so slippery that the engines cannot get on. Again, sometimes we find, although we know not the cause, that enough passengers would come to fill a train, while at other times it will be nearly empty. If we knew exactly what traffic we had to carry by every train we could provide properly and efficiently, but it must inevitably happen, under all circumstances, that delays will take place.

12,437. The train from Leeds to Derby, which is advertised to meet the train from Ambergate to Buxton was for weeks together not in time at Ambergate for the Buxton afternoon train?—Yes. That train is in connexion with the London and North-western line at Ingleton on the one hand, and with the North-eastern at Normanton on the other. In the summer time there is an enormous traffic passing to and from Scotland, and it is a very rare thing that we can leave either Ingleton in time or Normanton in time; it is no fault either of the North-western Company or the North-eastern Company, but from the mere weight of the traffic, and more especially from the great amount of luggage the passengers take

with them, the trains are delayed, and you will find that they are far more delayed from that cause than any other, from the numerous packages and luggage which passengers take with them. That train every year, for many years past, has been delayed, but in nine cases out of ten it has been owing to the late start either at Ingleton on the one side, or at Normanton on the other. The only remedy for it, and it has been discussed by the railway companies frequently, is for all the companies to take a longer time; if the London and North-western Company, for example, took an hour longer from Carlisle to London and the North-eastern Company would do the same from Newcastle to London it might meet the difficulty, but it is not a very desirable thing to alter your time table for those long trains more frequently than can be avoided. During the months of July and August the down-trains are late and the up-trains are punctual. During the months of September and October the up-trains are late, and the down-trains are punctual. Taking the same week, passengers seem to select particular days in the week, and on some days the trains keep time, while on other days they will not; for instance, on Monday very few persons seem to go on that day, and the trains are usually in time. If you altered your time table you would have to consume the time at the stations, and passengers would complain of that, so that upon the whole we have come to the conclusion that delays are unavoidable, and that it is better to submit to them than to alter the time table.

12,438. (*Mr. Glyn.*) There is pressure put upon you at a particular part of the year, both up and down the line?—Yes.

12,439. (*Capt. Galton.*) Do you make special arrangements and provide additional assistants when trains arrive to take out and put in luggage?—Yes, we generally put on a large additional force in the summer time, but if you take the guard's van or the railway carriages, there can only be a certain number of men at work, and the luggage gets so mixed, although unavoidably so, the object being to get the trains off as quickly as possible, that when a passenger gets to his destination there is a difficulty in finding it.

12,440. (*Earl of Belmore.*) Do you not think that this want of punctuality increases the risk of accident?—I think not; certainly not, if the slightest attention is paid to the signals.

12,441. (*Mr. Horsfall.*) The case to which I was alluding just now was Lichfield, where the London and North-western train from Liverpool arrives at 11.56 and the Midland train for Derby leaves at 11.55?—I think that is very likely.

12,442. That is one of the cases in which, for the benefit of the public, an alteration of two or three minutes might be made with advantage?—But the London and North-western trains have their connexions at other points and they must keep them, and we have the same. But if you take the case of a passenger from Derby to Lichfield going on from there to Liverpool, that is not the route which passengers would take, nor to Crewe either. No passenger would go to Lichfield to get to Liverpool direct from Derby.

12,443. But the intermediate residents between Crewe and Lichfield would do so, would they not?—On the Midland railway the only intermediate places are Willington and Burton, and at Burton they would again join the North Staffordshire railway and go on to Liverpool or to Crewe, and not go through to Lichfield.

12,444. I mean that the intermediate residents between Crewe and Lichfield would go to Lichfield to take advantage of those trains?—If it had been a matter of serious moment I must have heard of it, and I do not remember having received a letter upon the subject. No doubt it is as you state by the time bill, but the amount of inconvenience is so infinitesimally small that I do not think it would be prudent to alter the time tables and inconvenience the larger service.

12,445. (*Capt. Galton.*) With regard to the question of accidents, you stated that you did not think that unpunctuality was a source of accident if the signals were observed; is it not a fact that in almost every case of collision the trains have been unpunctual in some degree?—Yes, but that is not the cause of the accident.

12,446. Is it not the case that unpunctuality has very frequently been present, at all events in such instances?—A train a minute late is unpunctual, and probably there are very few trains that would run precisely to a minute, and a minute may cause an accident; but in all my experience I am bound to say that I do not remember any serious accident, or an accident of any importance indeed, arising from unpunctuality, or which could be traced to unpunctuality. The cause of nineteen-twentieths of the accidents that occur is, that the men get so accustomed, a driver, for instance, gets so accustomed to finding everything clear, and he is, perhaps, engaged with the machinery and a variety of things, that he does not look out for the signals as he should do.

12,447. If the train is unpunctual before him he runs into that train, whereas, if it had kept its time that time would have been so arranged that he should not come near it?—It would happen quite as frequently that the train running into the other was unpunctual. I do not think that it is always the train in front or the train that is run into that is unpunctual.

12,448. (*Mr. Gower.*) With reference to your former answer, are there any of the smaller companies in connexion with the Midland Railway Company which place difficulties in the way of meeting your trains?—I am not aware of any. I do not remember a single instance of obstructions of that kind being placed in the way; I may state that there might be, but I do not know of any instance myself.

12,449. (*Chairman.*) Now will you take Mr. Cox's evidence and make what remarks you think necessary upon it. You observe that one of his figures with regard to the rate from Matlock to Derby he has corrected in a foot note, but he states that the rate is considerably too high?—I am afraid that his correction does not meet the case at all. I will take first the answer to question 8579, where he says, "For instance, "if we want to send goods from Derby to Newark "which is only 33 miles, they charge us 10*s.* a ton, "and they will carry from Birmingham, which is 75 "miles, for 18*s.* 4*d.* a ton. At Birmingham sheet lead "and lead pipes are manufactured which come in con- "tact with our business, so that we pay seven-eighths "of a penny more than we do from Birmingham for a "greater distance. They will carry from London a "distance of 142 miles at 25*s.*" From London to Newark, I may say the distance is 120 miles, not 142. It is perfectly true that by the Midland route it is 142 miles, but as we are obliged to charge the same as the shorter route if we are to get any traffic, it is not fair to quote our longer route in opposition to the Great Northern. The Great Northern is the direct route from London to Newark, and we of course are obliged to charge the same rates. There must be some mistake in the latter part of this answer, "and that is "less than the Derby charge, and that is only 3*d.*" I do not quite understand that answer. From Derby to Newark the rate is 10*s.* a ton, and from Birmingham to Newark it is 20*s.* per ton for sheet lead. For lead pipes, where Mr. Cox is correct, it is 10*s.* from Derby and 18*s.* 4*d.* from Birmingham, but if you deduct the terminals in each case the Birmingham rate leaves more per mile to the Midland railway than the Derby rate.

12,450. (*Mr. Horsfall.*) What are the terminals in the two places?—Of course they would be the same in both cases. This rate is a collected and delivered rate. There is first of all the cartage to be considered. The cartage which we pay is 2*s.* 5*d.* and 2*s.* 6*d.* a ton, and that has to be deducted. Then, whatever terminal may be deducted for station purposes would be the same in both cases. Deduct what you will, whether 1*s.* or 2*s.* a ton, the remainder will

J. Allport, Esq.

20 Feb. 1866.

give a better rate from Birmingham to Newark than from Derby to Newark.

12,451. But you say that the difference arises from the terminals?—No, I do not say that. I say that if you deduct the terminals in each case the mileage rate will then be better from Birmingham to Newark than from Derby to Newark. Then there is this evidence given by Mr. Cox at question 8582: "Have "you found yourself prevented from entering into "competition in certain districts by this inequality of "charge?—We have. We have been prevented from "sending goods on account of the inequality of the "charges, and also on account of the very extra- "ordinary delay that occasionally we have to com- "plain of. To Manton (for Uppingham) the Midland "Company will convey goods from Birmingham, a "distance of 93 miles, for 17*s.* 6*d.* per ton, whilst "the rate from Derby to the same place is 20*s.* for "only 48 miles." The distance is 53 miles, so that that is a slight mistake. Then, again, the traffic either from Derby or from Birmingham to Manton is so insignificantly small that the higher rate from Derby is not from any desire to favour the Birmingham dealers; for I cannot find any entry in our books from Birmingham to Manton for lead, either sheet lead or lead pipes, for the last two years. The traffic is so insignificantly small that it may be as Mr. Cox has said.

12,452. (*Chairman.*) Would that explanation apply to several of those charges?—Yes, to several of them. These are inequalities which necessarily arise. I may state that the total goods rates upon the Midland Railway amount to hundreds of thousands, and it is utterly impossible to prevent these little inequalities arising in those small places; but whenever they are brought under our notice we correct them, as far as we possibly can. But the most important matter which Mr. Cox has alluded to with reference to rates is the next.

12,453. (*Mr. Horsfall.*) Before leaving that point, may not this very high rate which Mr. Cox complains of prevent goods going to this place?—The honourable member misunderstands me. I said from Birmingham; the Birmingham rate to Manton being so much less per mile than the Derby rate. I cannot find that we have sent any of Mr. Cox's particular goods to Manton from Birmingham. I believe that whatever trade has gone into that district Mr. Cox has had the benefit of; but that really is a very small matter. Mr. Cox, in the answer to the next question 8583, says, "I have a very remarkable case to mention "from Ambergate to Derby—I cannot understand "this at all—from Ambergate to Derby is only 10½ "miles, and they charge us 8*s.* 4*d.* per ton, whereas "they go from Ambergate to London, 157 miles, for "12*s.* 6*d.*" Ambergate, I may observe, is a mere junction. It may be that Mr. Cox has sent a small package of lead there, and I believe that he did. The Midland Company built a station there a short time since, and some lead may have been sent from Mr. Cox's works for that station, and he was charged 8*s.* 4*d.* per ton for it. The charge of 12*s.* 6*d.* per ton is for pig lead, which is a very different article; but from Ambergate there is very little pig lead got. The succeeding part of his answer is most important.

12,454. (*Mr. Horsfall.*) Even though the amount is small there is very great irregularity in the rate, is there not?—The one includes collection and delivery, and the other is merely from station to station, not including cartage, that is a most important difference. It includes 2*s.* 6*d.* a ton which we pay to our agents at Derby, and it also includes delivery, if there should be any, at Ambergate, whereas the 12*s.* 6*d.* from Ambergate to London is simply from station to station, and is for pig lead, which goes in truck loads. In that part of the country, I find that the amount of traffic is utterly insignificant. His Grace will know Ambergate thoroughly well, and that there is no population there; it is a mere junction, and the traffic is so small there that it is quite insignificant.

12,455. (*Chairman.*) The junction may take it on to other parts, may it not?—No, they are all through rates through Ambergate, excepting from Ambergate itself. I think Mr. Cox corrected his figure as regards the Matlock rate from 16*s.* 8*d.* to 11*s.* 8*d.*, but 11*s.* 8*d.* is just as incorrect as 16*s.* 8*d.*

12,456. (*Mr. Horsfall.*) It appears to me that you solve all your difficulties by laying the blame upon the difference of terminal charge, but it is not supposed that the senders of goods in all those directions should know these matters which you gentlemen connected with railways are no doubt acquainted with?—We find that traders are thoroughly alive to all those differences. There is not a trader hardly upon the Midland railway who is not thoroughly alive to the difference between a station to station rate and a collected and delivered rate.

12,457. (*Mr. Glyn.*) They may have the fullest information if they only ask for it, may they not?—Undoubtedly; and in fact they do know about it; no one can dispute that for a moment.

12,458. (*Mr. Horsfall.*) Do you publish a list of your terminal charges?—We do not. With regard to the amount of traffic sent to Ambergate, it is so infinitesimally small, that it is scarcely worth while to refer to it, but the important part of the statement is the latter part of Mr. Cox's answer to that question, "From Matlock to Derby, which is only 16½ miles, "they charge" (*quoting the correction*) "11*s.* 8*d.*, "and they go from Matlock to London for 14*s.* 10*d.*" Mr. Cox is there comparing pig lead from Matlock to London with high class goods from Matlock to Derby, in the one case including collection and delivery, and in the other merely station to station. Then Mr. Cox goes on to say, "That is a serious thing to us, "because the greater bulk of our pig lead comes from "that district, and consequently those London gentle- "men can get it considerably less, amounting to quite "a small profit on their freight." I am very much surprised that Mr. Cox should make this statement, because I am sure he would not do it if he had spoken from his own personal knowledge. The rate for pig lead from Matlock to London is, as Mr. Cox states, 14*s.* 10*d.*; the rate for the same article from Matlock to Derby is 3*s.* 3*d.*, and has been so now, as far as I can go back, for the last 14 or 15 years. Instead of being 11*s.* 8*d.*, as he puts it here corrected, it is 3*s.* 3*d.*, and has been so for many years.

12,459. (*Chairman.*) Can you explain why he stated that; is not there some foundation or other for it?—Not the slightest foundation for it. What Mr. Cox has done, or rather some clerk of his, I suppose, who has put that paper in his hands, is this, he has taken our classified rate, and we have a rate of 11*s.* 8*d.* a ton for ordinary merchandise, for a box of goods or a packet of grocery, or anything of that kind; that is our rate from Derby to Matlock, which includes collection and delivery, but for pig lead, which Mr. Cox is here distinctly alluding to, and in fact he says pig lead, the charge is 3*s.* 3*d.* per ton.

12,460. (*Mr. Glyn.*) That is the regular rate?—Yes, it is the regular rate. Mr. Cox goes on to say that Mr. Wass, from whom he buys a considerable quantity of lead, sends it by canal. It is perfectly true that even at that low rate of 3*s.* 3*d.* per ton the great bulk of the lead goes by canal, but his Grace will know that Mr. Wass's position there is very much more convenient for the canal than it is for the railway. He puts his lead on at the Cromford wharf, and it is very cheap conveyance from Cromford to Derby, whereas it is a very heavy cartage from Mr. Wass's smelting works to the Matlock station, but he is comparing two totally different commodities. He might with as much propriety say that we charge, say 100*s.* for a ton of gold from Derby to Matlock, and charge 14*s.* 2*d.* for a ton of pig lead from Matlock to London, there would be just as much propriety in the comparison.

12,461. (*Chairman.*) Is there any other charge made by Mr. Cox which you think it necessary to refer to?—Yes. Mr. Cox goes on to talk about lead

from Newcastle to Derby, and in answer to question 8,585 he compares that, as he says, with coke from Newcastle to Burton. Lead does come from Newcastle to Derby, but coke does not come from Newcastle; the coke comes from the neighbourhood of Darlington, and for lead we find waggons and sheets, whereas for coke we do not find waggons or sheets; the coke burner finds them. Besides, I cannot understand why coke worth at the ovens, perhaps at the present high price of coke about 9*s.* or 10*s.*, should be compared with pig lead worth about 21*l.* or 22*l.* a ton; but as I said before, we find waggons in the one case, and we do not in the other.

12,462. (*Mr. Horsfall.*) A waggon will take much more lead than it will take coal or coke in weight, will it not?—No; we get about five tons of coke in a waggon, but we do not find waggons for coke.

12,463. What weight of lead would you put in a waggon?—We never put more than five or six tons; there is very little difference in that respect. Mr. Cox, in answer to question 8595, says, "When they "charge the same for 90 miles as they do for 59 miles, "for instance, I think that is a thing which we "ought to complain of. From London to Stamford, "where we send goods, they charge 20*s.* a ton; "Stamford is 90 miles from London, and it is only "59 miles from Derby, but they charge the same "price." There again he has fallen into the error of taking the longer route instead of the shorter one by the Great Northern, which is 85 miles. To Peterborough also Mr. Cox calls it 110 miles, whereas it is 75 miles by the Great Northern direct route. It is true it is 110 miles round by the Midland. Then this question is put to Mr. Cox, "Have you any water "communication at Derby," and he says, "Yes, but "they have bought it up." The next question is, "Is it in the hands of the Midland Railway Com-"pany," to which he replies, "Yes, they bought the "canal." The Midland Company has never had that canal either by purchase or lease in any way whatever, and I am not aware that any negotiation has ever taken place even for the purchase of that canal. And to show the contradiction of Mr. Cox, he himself in another part says that they have competition by canal, for Mr. Wass, because of the high charge from Matlock to Derby by rail, sends his lead by canal. But Mr. Cox is altogether mistaken in supposing that the Midland Company have either bought the canal, or leased it; it is not the case.

12,464. Has any other railway company done so?—No, it is perfectly independent.

12,465. (*Capt. Galton.*) Is it the canal of the Peak that you are speaking of?—No, it is the Derby canal. It runs from about four miles north of Derby, from a place called Little Eaton, through Derby, and runs into the Trent on one side and into the Erewash Valley Canal on the other, and it is as perfectly independent of any railway company as the Midland Railway is independent of any other railway company. Then Mr. Cox goes on with several of the other witnesses complaining about Derby being the monopoly of the Midland Company, and the rates being very high in consequence. I have been at the trouble of comparing the Derby rates with the rates of other companies, the London and North-western, the Great Northern, the Great Western, and the North-eastern for similar distances, and I cannot find that in any one case we are higher than those companies for similar distances under like circumstances. Again, all those Derby witnesses complain of there being no competition with the Midland Company, and they say how desirable it would be for the London and North-western Company to come to Derby. Take the Derby rates and the Nottingham rates. At Nottingham there is competition, and the distance between London and Nottingham and London and Derby being about the same. (I think Nottingham is about two or three miles nearer London than Derby). There is not a single instance of the rates being higher to Derby than to Nottingham, but in almost every instance the Nottingham rates are higher than the Derby rates. I hold in my hand a list of rates charged to those gentlemen, Mr. Cox, Mr. Renals, and others, and in every instance the rate is as I state, 27*s.* 6*d.* against 30*s.* for agricultural seeds; ale and porter 23*s.* 4*d.* against 25*s.*, and so on, and I would beg leave to hand in this table:—

MIDLAND RAILWAY.

RATES.

12,466. Then the effect of competition as between Nottingham and London has not been to reduce the rates?—No, it has not. Mr. Cox, I observe, acknowledges that occasionally his people (I do not for one moment suppose that he would do it himself) pack his goods in casks so that the class may be avoided, or perhaps they declare them so as to get a lower rate. In answer to question 8,657, "You object to some extent to the "present classification of goods?" he says, "Yes, we "put the shot into casks for them sometimes and they "do not know what it is." That is a very questionable proceeding; shot happens to be in a different classification from lead, and of course if we find it out we make them pay, but unfortunately we are subject to this sort of thing all through the country.

12,467. Do you consider that you have a right to open the packages and see what they contain?—No, we never do inspect the goods further than the appearance; our people know what they are. We are so accustomed to goods, particularly those that are brought down by the parties themselves, which are collected from certain manufactories, that we know exactly what they are; but it is no uncommon thing for goods to be declared as one thing when they really are another. More especially does this apply to silk and very valuable commodities of that kind.

12,468. If they were damaged they could not under such circumstances claim for the value of such commodities?—No.

12,469. (*Mr. Horsfall.*) Is not the fact that shot is lead?—True, shot is lead, but it is a damageable commodity. We are obliged to be exceedingly careful with shot, if it gets wet it is thrown upon our hands, and we have to pay damages for it.

12,470. Would you have to pay if they had shipped it as lead?—No, not if they had shipped it as lead; I should hardly think that Mr. Cox would venture to declare it as lead, and then if he found it damaged to claim damages.

12,471. He does not declare it to be shot lead but he declares it to be lead, which it is in fact?—Perfectly true, it is lead. So cutlery you may call pig-iron because it originally comes from pig-iron.

12,472. (*Earl of Belmore.*) If you got a cask of shot, your people would not suppose that it was manufactured lead that was in the cask?—Yes, we get a great deal of common lead in casks, particularly scrap lead, for which we charge the lowest rates.

12,473. (*Mr Horsfall.*) Is not shot always shipped in casks, first put in bags and then in casks?—No, it is generally loose in bags. Great quantities of it are sent loose in bags; they are in small bags weighing about 28 lbs. I think that that will pretty well exhaust Mr. Cox's charges.

12,474. (*Chairman.*) Now will you come to Mr. Renals' charges, and give the Commission what explanation you think desirable with regard to them?—Mr. Renals complains of the rates for groceries, and it amounts to this, that sugars from London to Sheffield are charged lower than from London to Derby. It is perfectly true. First of all the cheap water conveyance, as I stated before, accounts for the Sheffield rate being so low. But there is another and a very important consideration. There is a very large sugar refinery in Sheffield, taking more sugar probably in one week than the whole town of Derby would take in six months; they get it in full loads, in fact, and on that account the rate is lower. But the principal reason of it being lower, as I stated before, is the cheap water communication between London and Sheffield.

12,475. (*Mr. Horsfall.*) Did you not state just now that you did not make any deduction for a large quantity?—Not to the same place. We charge to the grocer in Sheffield the same as we do to the sugar refinery; but for the purpose of getting a large quantity for the refinery we charge a lower rate; but we do not charge a different rate for it individually.

12,476. (*Capt. Galton.*) You give a low rate to the town?—Yes, we give a low rate to the town.

12,477. In order to develop the trade?—Yes, quite so; but practically we do not get the sugar trade from London to Sheffield. The great bulk of it goes by water still. I should think that fully four-fifths of it would go by water, in spite of this low rate. Turning to Mr. Cox's evidence, I see that Mr. Cox complains of the Midland Company charging for demurrage. I hold in my hand the only charge that has ever been made to Mr. Cox for demurrage, amounting to 3*l.* 15*s.*, extending over a very considerable period; and in that list there are 11 waggons belonging to other companies upon which we had paid the demurrage through the clearing house, and there are only three Midland waggons charged demurrage; but up to this moment Mr. Cox has refused to pay the amount, although 3*l.* 6*s.* out of the 3*l.* 15*s.* we have ourselves paid to other companies—the London and North-western, the North-eastern, the Lancashire and Yorkshire, and other companies. I do not think Mr. Cox has much to complain of there.

12,478. (*Mr. Horsfall.*) Mr. Cox was not speaking of individual acts of injustice towards him, but he spoke as representing the Chamber of Commerce?—He speaks, I think, mostly of his own case, with regard to this demurrage.

12,479. If he did it would be merely an illustration of the system?—Quite so; and I am quite prepared to defend the system. It is a very unfair thing that Mr. Cox, or any other trader, should keep our trucks standing under their load day after day. We allow them two clear days to take away their goods. Indeed, if we did not adopt some system of charge for demurrage we should have our stations so blocked up that we should never get the traffic through the country.

12,480. I was not speaking of the justice or the injustice of the claim. It may be perfectly right; but what I wanted to show was, that when you brought forward such a minimum amount of charge on the part of the company towards Mr. Cox he was not instancing that as a complaint of his own, but as a specimen of the general complaint of the trade?—I will refer to his evidence, and that will show that what I have said was correct. At question 8671 he is asked this: "Do you "consider that a railway company should be bound to "deliver goods within a certain time if they declare "that time when the goods are put into their hands?—"*A.* I think that they should, the same as with regard "to the time table; when you get into a train and "leave Derby at such an hour you expect to be in "London at the time mentioned in the time table. "*Q.* If goods are not delivered within that time you "propose that the companies should be subjected to "pay some compensation?—*A.* I think they ought "indeed, because they are very particular if we do not "fetch our goods away from them in charging us "demurrage."

12,481. Of course he is speaking there of the general principle, and not of his own individual case?—That may be, but I would rather gather from that answer that Mr. Cox was speaking of his own particular case, and I give that explanation. I am not aware of any complaint ever having been received from any person in Derby, with regard to those demurrage charges. It is a charge which is made throughout the kingdom. It is for the interest of railway companies that the goods should be unloaded. It would not pay to have a waggon standing under its load even at the 3*s.* per day which we charge for demurrage. We should make very much more out of our waggons. I have had a return made out of the average earning of a Midland waggon, which amounts to about 85*l.* a year, and you divide that by 300 working days, it will give a great deal more than 3*s.* a day; consequently the trader is benefited by it. In fact, in other words, it is finding a certain amount of warehouse room for him. Instead of taking the goods away to his own place, he chooses to let them remain in the company's trucks; but, having found him that accommodation, and merely making him the charge that we do for it, it is monstrously unfair that he should come and complain of it.

12,482. I am not referring to the justice or injustice of it; I am merely showing that Mr. Cox has not made this charge as an individual case, but as a specimen of the charges which are made?—I think I have sufficiently answered those charges.

12,483. (*Chairman.*) Have you anything further to state with regard to Mr. Renals' complaint?—In answer to question 8688, Mr. Renals not only referred to Sheffield but also to Chesterfield. Chesterfield, as I have before explained, comes under the same category as Sheffield, with regard to cheap water communication. And there again, I am sorry to say that we get very little of the traffic from London to Chesterfield. Mr. Renals repeats Mr. Cox's statement, that the Derby people are entirely in the hands of the Midland Company; that is not so. I may therefore explain that in addition to the North Staffordshire Company, being at Derby, the London and North-western are there also, through their agents; and I have a return laid before me weekly of the goods traffic from Derby to London, and all places in competition with the Midland by the London and North-western, and I find that they get very nearly one-half of the traffic out of Derby, and have done so for a long time past. Between London and Derby the London and North-western Company get very nearly one-half of the traffic.

12,484. (*Capt. Galton.*) How do they get into Derby?—We carry traffic for them. We have had an agreement with the London and North-western Company, and Pickford and Co., who are their agents, collect the goods in London and in Derby, and we carry them and deliver them over to them at Rugby. I have looked over the correspondence, and I cannot find a single complaint from the London and North-western Company, or from any trader, that traffic coming by way of the London and North-western line has either been delayed or treated differently from traffic coming by our own line from London.

12,485. (*Mr. Glyn.*) There is a fair interchange of traffic between the two companies?—Perfectly so.

12,486. (*Capt. Galton.*) The London and North-western Company employ their agents, Pickford and Co., to collect the goods from Midland stations?—Yes; the same rates are charged from Derby to London, so that if the London and North-western had a line of their own into Derby they could not do more than they do now. In fact they could not do what they do now because they would have to do the best they could, as we should not have through rates with them by way of Rugby, and at present, as I said before, they get half the traffic.

12,487. One of Mr. Renals' complaints was with regard to the classification of goods, have you anything to say in answer to that?—I thought it perhaps tiresome to allude to that; he speaks of nutmegs and sugar, or cinnamon and molasses, and he would have them all put in the same class. I should have made a remark upon that but I passed it over as I thought it was scarcely worth while for me to refer to it. They have nothing in my opinion to complain of as to the rates charged to Derby. Mr. Renals instances the falling off of Derby in consequence of what he chooses to call the Midland monopoly. He says, "The rateable value in "1855 was something like 106,000*l.*, it is now only "119,000*l.*, so that we have made very slight progress "indeed in these days of progress." And another witness says that the population of Derby has not increased more than about 5,000 in 10 years. That is a very unfair way of putting it. If you take the borough of Derby itself that is so, but Derby like all other places has surrounding parishes, and the parish of Litchurch is as much a part of Derby as Westminster is of London, in fact, more so. The population has been gradually increasing in that direction, and I find that the population has increased, including Litchurch, from 43,684 to 51,000 in the 10 years. But the great increase is in the parish of Litchurch, which has increased from 1,726 to 6,560, and he speaks of the trade of Derby diminishing.

12,488. (*Chairman.*) Is not that increase of Litchurch mainly owing to your works being at Litchurch?—No; I quite expected that that question would be put to me, but I have brought a map of Derby, which if the Commissioners will allow me I will lay before them, from which they will see that the blue represents the borough of Derby; they will also see the line running towards Birmingham, and the land about there is very favourable for building manufactories; from the London Road all the way down in that direction for fully three-quarters of a mile it is one continued series of works and manufactories of various kinds; I do not know of any place of its size that has increased more than Derby has. The cause of the falling off in the trade of Derby, of which Mr. Renals complains, is owing to the peculiarity of its staple trade, namely, silk. The trade of Derby, something like Coventry, is the fancy silk trade which of late years has very much fallen off, and it is perfectly true that the silk mills and the silk population of Derby has decreased. But it has gone to other places, Nottingham for instance has very much increased in silk, and Macclesfield, Leek, and all those places, are now becoming important seats of the silk trade; but the general trade of Derby and the general prosperity of the town has very much increased. I may state that there are about four or five very large important ironworks and mills, Eastwoods, Swinglers, and several others. I have spoken to those gentlemen, and I have spoken to the principal manufacturers and traders in Derby, and so far from the Derby people concurring in the statements that have been made before the Commissioners, if necessary I could have brought several of them who would say that they have in their respective trades been treated most fairly by the Midland Company. I may mention, with regard to the silk trade, that so long as the silk trade was really the staple trade of Derby, and very little of it was made at Nottingham, the rate to Derby was 2*s.* 9*d.* per cwt. or 55*s.* per ton, and to Nottingham it was 4*l.* a ton. Gradually Nottingham began the silk trade, and it has not been thoroughly equalized at the present moment. We charge 3*l.* per ton to Derby, and 3*l.* 10*s.* to Nottingham.

12,489. (*Capt. Galton.*) Why have you raised the price to Derby?—We have raised the Derby and lowered the Nottingham charges so as to put the two on the same footing. Silk is manufactured almost as much at Nottingham as at Derby, and we are gradually putting them both upon the same footing.

12,490. You have raised the Derby rate because there has been a diminution in the production, I suppose?—It is not so. Derby at one time refused to take any responsiblity for the carriage of silk; and then, we said, "We will have two rates, one at your "own risk, and one at the company's." We charge 3*s.* at the owner's risk, and 4*s.* 6*d.* at the company's risk.

12,491. Why did you raise it from what it was before?—We only raised it from 2*s.* 9*d.* to 3*s.* That is all the advance, and that was many years ago.

J. Allport, Esq.

20 Feb. 1866.

I should think it is now 10 years ago, probably, and it has remained at the present rate ever since.

12,492. (*Chairman.*) Do you maintain that the gentlemen who came here on behalf of the Derby Chamber of Commerce do not represent what would be the manufacturers in the town?—No, they do not. As to Mr. Cox, taking the entire of Mr. Cox's account, it is a very small one, and Mr. Renals' is the same; and in the case of Mr. Nicholson, who represents the silk trade, his account is about 10*l.* per month. That is a very unimportant amount, and I should mention that he complains that the silk rate to Derby is 3*s.* per cwt., or 3*l.* per ton. A ton of silk is worth about 2,800*l.*, and if we take the risk ourselves we get 4*s.* 6*d.*, or 4*l.* 10*s.* for carrying a quantity for which we are liable to 2,800*l.*

12,493. (*Capt. Galton.*) You are speaking of the raw material, whereas he was referring to the manufactured goods?—Then the argument is still more in my favour. He speaks of ribbons being put on rollers, and that we charge the same rate for the manufactured article as we do for raw silk, on account of the weight of those rollers. But if you take 5 cwt. of raw silk, and 5 cwt. of the manufactured article, including the wood. The value of the manufactured article is very much greater than that of the raw material. But 3*l.* 10*s.* per ton, for an article worth 2,800*l.*, I do not think can be considered excessive.

12,494. (*Earl of Belmore.*) You think that Mr. Nicholson is unreasonable when he says, in answer to question 8778, "And you decline to pay that?" (meaning 4*s.* 6*d.* per cwt.)—"Yes, we decline to pay "that; we think 50 per cent. upon the actual carriage "a very heavy tax upon us."—I can only say that 4*l.* 10*s.* for a ton of stuff worth 2,800*l.* does not appear to me to be an excessive charge. As regards the population of Derby I find, including Litchurch, that the increase in the population is 17½ per cent. I have taken out a variety of manufacturing and commercial towns, including such places as Ashton, Aylesbury, Blackburn, Coventry, Derby, Dudley, Exeter, Gateshead, Huddersfield, Halifax, and towns similar in population, and I find that the average increase in all those towns amounts to 14·89 per cent., whereas Derby has increased 17½ per cent. I also find that one of the witnesses alludes to the rateable value. I find from the Derby and Litchurch poor-rate books that the value of the gross rental of property in Derby in 1855, including Litchurch, was 175,691*l.*, and that in 1865 it was 187,863*l.*, which is an increase of 12,172*l.* That I think is another indication of the prosperity of the town of Derby. If the Commission will allow me I will hand in these two statements.

RETURN showing the AVERAGE PER-CENTAGE of INCREASE in PLACES where the Population in 1851 was over 20,000 and under 50,000.

Increase, 1865		£ 12,172

I observe that Mr. Nicholson is very anxious that silk should be taken out of the Carriers' Act. Of course everyone in his own particular trade would desire to see the risk thrown upon the company.

12,495. (*Chairman.*) What have you to say with regard to Mr. Wheeldon's complaints?—With regard to Mr. Wheeldon, he puts in a table, and he complains of the Midland rates to Liverpool. As I stated before, we were not carriers to Liverpool until a very recent period, and we have nothing to do with those rates. He then puts in a table from Edinburgh to London, Newark, Derby, Burton, and Birmingham. It is a difficult table to understand, and he gives a table from Manchester to Newark, Nottingham, and Derby, and another from Liverpool to Melton, Peterborough, Lincoln, Newark, Stamford, Grantham, Nottingham, and Derby. From Edinburgh to London we are not carriers; from Edinburgh to Newark we are not carriers; we are carriers from Edinburgh to Derby and to Burton and to Birmingham, and those rates bear a favourable comparison with the others. From Manchester to Newark we are not carriers; from Manchester to Derby we do not fix the rates; from Manchester to Nottingham, to which place we are carriers, and have a voice in fixing the rates, the rate is 12*s.* 6*d.*, whereas from Manchester to Derby the rate is 15*s.* In saying that we are not carriers to Derby, I mean that the rate is fixed by the North Staffordshire Company perfectly irrespective of the Midland Company.

12,496. Is it the same if the goods come by Buxton from Manchester to Derby?—Quite the same. We have no control over the rate; we are not at present in Manchester. When we are, and when we open our own line, those rates will probably be equalized.

Mr. Wheeldon also alludes to the rates from Derby to Uttoxeter, from Derby to Burton, and from Derby to Nottingham. To Uttoxeter, he calls it 19 miles, 5*s.* 6*d.* and 6*s.* 8*d.*; that is again entirely the North Staffordshire line. From Derby to Nottingham, which is 16 miles, it is 3*s.* 3*d.*; that is entirely the Midland line. From Derby to Burton, which is 11 miles, it is 2*s.* 6*d.* to 3*s.* 9*d.*; that again is entirely the Midland line. Also Mr. Wheeldon, like the other witnesses, says that by getting another railway into Derby they would have those rates considerably reduced.

12,497. (*Capt. Galton.*) Your argument is that all the rates which have been complained of, and with which the Midland have anything to do, are lower than the other rates which have been complained of, are they not?—Yes, they are; and they will bear comparison with rates from any other place in the kingdom under similar circumstances. Mr. Wheeldon also complains of the low rate to Burton as compared with Derby. There again the Burton trade is a very peculiar trade. There is probably more barley sent into Burton in one week than all the grain put together that is sent to Derby in twelvemonths. And, acting upon the principle that we have always done in developing the particular trade of a district, we have given Burton very low rates for the carriage of barley and malt from various parts of the country.

12,498. His complaint is that you have recently raised the rate from Burton to Derby?—We raised it from 2*s.* 6*d.*, I think, to 3*s.* 6*d.* per ton.

12,499. He says 3*s.* 9*d.*?—It is 3*s.* 6*d.*

12,500. That is a considerable rise of the rate from 2*s.* 6*d.* to 3*s.* 6*d.*?—I should say it is from 2*s.* 6*d.* to 3*s.*; and when you come to deduct for the station expenses, it is a very small rate.

12,501. For what reason did you raise it?—We went through the Burton and Derby rates, and there were some inequalities in the rates to Burton, from Tamworth to Burton and from Derby to Burton, and we rectified those inequalities; that was the object of it. There is very little traffic from Derby to Burton. No grain is grown in the neighbourhood of Derby of any importance; it is purely a grazing country; but the great bulk of the grain comes from Lincolnshire and Norfolk and the grain-growing counties. The same remark will apply to the table which he puts in in answer to question 8885. He gives the rates from Burton, Newark, Leeds, and Derby, to Lynn, Swaffham, Dereham, Fakenham, Snettisham, Narboro', and Wells. We are not carriers to Newark nor to Leeds for that description of traffic; and if you will compare Burton and Derby with Newark and Leeds they bear a very favourable comparison. I think I have gone through pretty well the evidence of that description.

12,502. (*Chairman.*) From Nottingham there is quite a different class of complaint with regard to the coal trade being limited to nine particular coal dealers. What have you to say in answer to that?—We had a very small coal wharf at Nottingham. We bought a very large quantity of land, about 15 to 20 acres, and we converted it into a coal wharf. The moment we did that almost every person in Nottingham began to receive coals, and the place became so utterly confused and so crowded that it was impossible to carry on the business. We were receiving constant complaints both from the consumers and the traders in Nottingham and the coal owners, and I went myself to Nottingham and spent nearly a day there for the purpose of investigating them, and I found that although we had appropriated so large a space to the coal traffic, the whole yard was so crowded that it was impossible to get rid of the trucks. I found upwards of 500 trucks of coal standing in the Nottingham yard, and it was quite impossible for any of the parties to get at them. I then ascertained that great numbers of them were small dealers receiving a single truck, and that others were private consumers receiving perhaps a truck. It was absolutely essential to take steps to put a stop to that state of things, and we selected the largest merchants, and said, now we can only accommodate a certain number who will want to stack a certain quantity of coals, so many hundred tons each. There is the land. If it had been large enough for a dozen, we should have selected a dozen, but it was not. But we said (and I wrote, I think, myself to two parties who had complained, not dealers, but consumers), if you consumers choose to form yourselves into an association to get a sufficient quantity of coal so as to have a portion of the wharf allotted to you we will do so. But so far from causing any complaint on the part of the public generally, it has had directly the reverse effect. The public generally are perfectly satisfied, and there is not a coal owner upon the line who is not satisfied, and the arrangement is now working admirably for everybody. I see there is one witness who states that it has had the effect of advancing the price of coal, but that is not so. The price of coal all over the kingdom has advanced, but I am assured by most of the important coal owners upon the line that that arrangement has not had the effect of advancing the rate; on the contrary, it has rather tended to reduce it, because the coal owners get their waggons back much more quickly now than they did when they were in that state of confusion, and they can afford to sell the coal cheaper than they did before. I observe that one gentleman, in speaking of favouritism, says that the chairman of the Midland Railway, Mr. Ellis, is a coal owner and proprietor of the Hucknell Colliery. Mr. Ellis, I should say, died before that colliery was opened. It is true that his son, who is also a director of the Midland Railway, is one of the partners in that colliery, but he has no more influence as regards the rates than any gentleman in this room; and he also states that two gentlemen, Mr. Jessop and Mr. Wright, who are partners in the Butterley Colliery, are connected with the Midland Railway. That is not so. Mr. Jessop and Mr. Wright have no more connexion with the Midland Company than with any other railway company. I am not even aware that they are shareholders. The inference intended to be drawn was, that those gentlemen who are connected with the railway have some favour shown to them beyond the general public, but there is not a particle of foundation for any such charge.

12,503. (*Mr. Glyn.*) Upon what principle do you let the occupiers into those wharves?—Upon the principle of the largest dealers. One of those gentlemen who complains has the bulk of his trade by canal, and I can only suppose that he wanted accommodation in the yard for the purpose of getting the yard blocked up. He would order a truck or two of coals to be brought to the yard, to the manifest inconvenience of every trader and every consumer at the station. In fact, we found it impossible to deal with the trade. I have no hesitation in saying that under the present system the public of Nottingham are supplied with at least 50 per cent. more coals from this station than they could be if there were 60 or 70 dealers, each having a single truck, or two or three trucks. The same system must be adopted by every company; upon the London and North-western Railway at Camden Town they are obliged to restrict the wharf to certain individuals. They have I think there, as we have, taken the largest traders and let them the wharf.

12,504. (*Capt. Galton.*) The North-eastern Company have adopted a somewhat similar plan over the whole of their line, have they not?—No; the North-eastern Company have adopted this plan, they sell the coal for the coal owners. They found the same difficulty that we did. They found that, perhaps, 50 or 60 coal owners were anxious to send to any one particular station, each having an agent. That was very expensive, and caused great confusion, and they said, we will appoint a clerk of our own, and he shall sell the coal; he shall not interrupt in any way the desire of the trade. What a man asks for, that he shall have; that is their system. We have not done that. I think that that system to some extent is objectionable. But we allow the coal owners to appoint their own agents, and we said to the coal owners, whom should you like to have appointed? We said to Butterley, to Claycross,

J. Allport, Esq.

20 Feb. 1866.

and so on, whom do you wish to have wharf land allotted to? And we acted entirely upon the coal owners' recommendation.

12,505. The North-eastern Company give a great many more coal owners access to York than you give at Nottingham, do they not?—No.

12,506. They give about 60 coal owners access to York, as Captain O'Brien stated to the Commissioners? —I should think that there are more than 60 coal owners sending coal to Nottingham.

12,507. Did you not state that there were only nine? —I said nine dealers. A dealer buys his coal it may be from 10 or 12 coal owners. I can safely say without fear of contradiction that it is the only system that can be adopted with fairness to the company and to the public generally.

12,508. (*Mr. Glyn.*) Is it not a condition that those dealers should pass a certain quantity of coal through the wharf annually?—No, we selected those that we knew were the largest.

12,509. (*Chairman.*) Are you adopting the same practice at other towns?—At every large town on the line.

12,510. So that it is nothing peculiar to Nottingham? —Nothing at all.

12,511. (*Capt. Galton.*) Does not that entirely prevent any new coal dealer starting in Nottingham? —No, not exactly, If we find that a coal dealer wishes to start he would come to us and say, now, the Butterley Co. have agreed to sell me coals, and that being one of the largest collieries upon our line, we should at great inconvenience to ourselves accommodate the man.

12,512. Then you would turn out somebody else?— No, we should increase the number by curtailing the accommodation that the others possess. But if we say to the Butterley coal owners, is it your desire that this man should become your agent for the sale of your coals in Nottingham? And they say, "No we do not desire it," we should not appropriate the wharf to him.

12,513. (*Earl of Belmore.*) There is this difference between your company and the North-eastern Company, that they deal at their stations directly with the coal owner, whereas you deal with the coal agent or coal dealer?—No, we deal with the coal owners. We charge the coal owners the carriage; we have nothing to do with the agents. As I said before, we ask the coal owners whom they would like to have appointed as agents, and as a proof that it is satisfactory to the coal owners, there is not a single coal owner complaining.

12,514. (*Mr. Glyn.*) Do you let your wharf to the coal agents?—We do not let the wharf at all; we charge a terminal of so much per ton. We do not charge so much per year as rent for the wharf.

12,515. (*Earl of Belmore.*) You do not act in the same way that the North-eastern Company gave evidence that they do to the coal owners?—No; we charge the coal owners the dues.

12,516. You do not charge them a rent?—No; we do not charge a rent at all, we charge so much per ton; at Nottingham we charge 2*d.* per ton for terminals.

12,517. (*Capt. Galton.*) And all charges are paid by the coal owners?—Yes, all charges are paid by the coal owners.

12,518. Practically the way you put it would be this, that you ask the coal owners in the Erewash Valley to appoint nine agents for selling coal in Nottingham and leave it entirely to them?—We do not say nine. If it so happened that there had been ten or a dozen important coal dealers we should have curtailed the space of the others and have appointed those ten; but it so happened that there were only nine; it might have been that there would only have been eight or six, but we certainly take large dealers in preference to small ones.

12,519. Then Mr. Brentnall is not a large dealer, I suppose?—No, very small indeed by railway; he has a certain amount of trade by canal, and that is his principal trade.

12,520. Is that canal independent of the railway? —It is perfectly independent of us; it belongs to the Great Northern Company, and we have no control whatever over it.

12,521. (*Chairman.*) Do you wish to make any additions to your answers with regard to the complaints which have been made?—I think that I have pretty well exhausted them. There are many others, but the same principle applies to them.

12,522. (*Capt. Galton.*) You have not referred to the complaints of Mr. Corbett, I think?—I think Mr. Corbett's complaints do not extend to the Midland Railway, and Mr. Gentel also. I do not think that he complains of the Midland Railway at all; in fact it is remarkable to observe the almost unanimity (with the exception of three gentlemen at Derby) of all the witnesses in praising the Midland system. I wish to point out that if the Midland Company had been the obstructive which some of those gentlemen would lead the Commission to believe, I do not think there would have been the extraordinary development of the district which has taken place. I may mention that from 1850 to 1865 the increase, without a very much increased mileage, has been from 2,479,000 tons to 9,169,000 tons; whilst the passenger traffic upon the entire of the Midland system has only increased some 49 per cent., the mineral traffic has increased about 400 per cent., and the goods traffic between 200 and 300 per cent.

12,523. (*Capt. Galton.*) Mr. Corbett's answer to question 10,910, although not a charge against the Midland Company, bears a little upon the question of the Midland traffic. He complains that in sending his salt down through Bristol your waggons were detained a long time at Bristol, and that you charged him demurrage, although he had no possible control over them, because the salt was going on by the Bristol and Exeter Railway on to the broad gauge, and that the delay arose in consequence of the broad gauge railway not having provided trucks to take on the salt?—That is perfectly true; but you see we can only deal with Mr. Corbett in this matter. We say to him, we find you trucks to carry your salt to Bristol. When we start from the Stoke works we do not know that the salt is going by the Bristol and Exeter line.

12,524. Did not he get a through rate?—No.

12,525. He got a rate from you to Bristol, and from the Bristol and Exeter line forward?—Yes. It was Mr. Corbett's duty so to arrange his trade that that salt should be transferred from narrow gauge trucks to broad gauge ones.

12,526. You consider that he ought to have had an agent at Bristol to change it?—Yes. We have no control over the matter. The salt is standing in our yard in our trucks, and all we can do is to urge Mr. Corbett to unload the waggons as quickly as possible. We do not know where the salt is going to.

12,527. Practically, when he puts his salt in the Midland trucks at Stoke does not he forward it, or send an invoice with it showing that it is to go on to Exeter?—No; we only invoice to Bristol.

12,528. Do you invoice no goods beyond Bristol? —Not in the case of salt. It is only very recently that the Bristol and Exeter Company have allowed any goods to be invoiced beyond Bristol at all; they have only recently joined the clearing house.

12,529. Have they created obstructions in the way of traffic flowing in that direction?—I do not know that they are obstructions, but they have not had through rates; they have not given the facility of through rates till recently, but now they have done so.

12,530. Do you find the break of gauge a very serious inconvenience at Bristol?—A very serious inconvenience; the most serious inconvenience that we have to contend with on that part of our line is the break of gauge at Bristol and Gloucester. It has practically annihilated the whole of our trade at Gloucester with South Wales. Since the opening of the narrow gauge lines from Newport round by

Shrewsbury and various other places the whole of our traffic from South Wales has been annihilated.

12,531. Is the inconvenience such that the public suffer from it to a great extent or not ?—To a certain extent they must suffer.

12,532. I mean the public interests generally of the country ?—I think so, undoubtedly. The delay which necessarily takes place in transferring goods from the broad to the narrow gauge, or *vice versâ*, is very great, and it entails loss on the public. Take the case of Swansea. There is a very large copper trade from Swansea to Birmingham ; the whole of that at one time passed through Gloucester, and had to be transferred. You cannot calculate less than a day for the transfer ; and the entire of that traffic is lost now to the Midland Company, because there is a narrow gauge route through from Swansea through the country by way of Shrewsbury and back to Birmingham.

12,533. That goes a long way round, does it not ?—Not to Shrewsbury ; it goes by way of Stourbridge.

12,534. By Worcester and Wolverhampton to Birmingham ?—Yes, that is the route it takes ; but we have no power over that at present.

12,535. Do you find any inconvenience with regard to the lines in the south going towards Exeter and Devonport ?—Yes ; there is a very large traffic now absolutely sent through London, and by the London and South-western Railway, to Exeter, which formerly went by way of Bristol, and which would go by way of Bristol if there was not the break of gauge. In fact, so important have we considered the break of gauge that we have offered to the Great Western Company to contribute very largely towards finding the capital for laying down the narrow gauge from Gloucester to Swansea.

12,536. (*Chairman.*) Except in the instance of a break of gauge, do you think that any general regulations could be introduced to obtain facilities for the interchange of traffic between different railway companies ?—I think not. I think there is such a general interchange of traffic now between almost all the companies, that I do not think any legislative interference is at all necessary. I think it would be manifestly unfair if companies were compelled to adopt through rates with each other ; it would, practically, be a compulsory partnership.

12,537. (*Capt. Galton.*) Is it entirely that ? If you were compelled to give a through rate you would simply have the power of charging the maximum rate on the line of one company at all events ?—Let me give an instance. The Midland Company have spent millions in getting into the Derbyshire and Nottinghamshire coal-fields, for the purpose of carrying coals to various points. The Midland Company has a line one way from the collieries to, say, Peterborough, and there is a line also from the collieries, *viâ* Nottingham, to Peterborough. It would be manifestly very unjust to the Midland Company to say, although you have spent your money, and although you are willing to carry to Peterborough at the same rates, you shall be compelled to divide with the Great Northern Company. It is true we make arrangements, and have made arrangements, with the Great Northern Company, by which they get traffic, by way of Nottingham, to Peterborough, but that ought to be left to the private arrangement of the companies.

12,538. (*Mr. Glyn.*) Do not you, in fact, find in practice that the booking through both of passengers and goods from one company to another is carried on so satisfactorily as to obviate almost the necessity of having any further compulsory powers ?—It is so. I do not think that it could be very much extended without great inconvenience. Some of the witnesses talk about the compulsory booking through of passengers. We find it impossible to book through passengers on our own system. The number of tickets become so unwieldy and so extraordinary that we are obliged to divide our own system, and the same is the case with the London and North-western Company.

12,539. You do not even book through on your own system ?—No.

12,540. You do not book, for instance, beyond Birmingham, I think ?—We book from the principal stations ; for instance, from Leeds, Sheffield, Nottingham, or Derby we should book through to Worcester, Gloucester, Bristol, and so on, but from Darfield, north of Derby, to Desford or to Eckington on the Bristol and Birmingham line, we should not book through probably ; it would not be possible I mean, because it would be encumbering the stations with such an immense mass of tickets. The number would be so voluminous that no system of check which could be adopted would be sufficient.

12,541. (*Mr. Glyn.*) The restriction is absolutely necessary, and the system of through booking could not be carried out as a matter of clerical detail ?—Precisely so. I may mention that on the Midland Railway we have about 300 stations, and you must have 1st, 2nd, and 3rd class tickets, and including return tickets and special tickets altogether, we should require about six tickets for each station. But supposing each station only issued one ticket per day, still you cannot send to a station less than one hundred tickets, and if you multiply that by a number of stations it becomes so unwieldy that the tickets issued to the stations would amount to hundreds of thousands.

12,542. (*Capt. Galton.*) Each of your station offices must contain 3,000 boxes of tickets ?—Yes, and it would be perfectly unwieldy in practice.

12,543. (*Mr. Glyn.*) They could not be manipulated, I suppose ?—They could not. As regards passengers, I am sure all the companies are treating the public very fairly in booking through.

12,544. And as regards goods ?—And as regards goods also. It is a great inconvenience to the companies themselves not to have through rates. I admit that there was a time when through rates were refused in a variety of cases, but that is all gradually dying away ; there is very little of it now.

12,545. (*Capt. Galton.*) You consider that in the course of a few years at all events the railways will be worked almost as one system ?—I think so, leaving the companies to make their own arrangements.

12,546. (*Mr. Glyn.*) Take the other point of view. In forwarding on is it not to the advantage of every company that they should forward on both goods and passengers as quickly as they can ?—Quite so.

12,547. No delay or impediment is ever thrown in the way, for it would be against the working of their whole system if they did it ?—I do not think that it is to any appreciable extent carried on in any part of the kingdom. The Midland Company certainly was perhaps one of the first to adopt what I may term free-trade principles upon their railways, and we have for years been endeavouring to induce the companies around us to make through rates. Take the article of coal : for many years we tried to induce our friends, the London and North-western Company, to do so, and they refused until the last few years. Now we have a system of interchange of coal, and we take our mileage proportion without reference to any competing point. Take the case of London : we have our own line to London and we could carry a greater bulk of coal, but we are just as anxious that the London and North-western Company should carry all they can, and the same with the Great Western, and the same with the Great Northern. I have here a return of coals into London during the last year. It is a sheet which is issued by the Coal Exchange under the authority of the Corporation of London, upon which the coal duties are charged, and during the year 1865 the total quantity of coal carried into London was 2,733,000 tons, and of that 2,733,000 tons nearly 1,500,000 tons were from collieries upon the Midland Railway, not carried to London by the Midland Company, for we only carried 134,000 tons ourselves, but by the Great Northern, the London and North-western, the Great Western, and the Great Eastern Railway Companies that large quantities of coal was taken to London.

12,548. (*Capt. Galton.*) Still the distance that the coal would travel from the collieries on the Midland

J. Allport, Esq.
20 Feb. 1866.

line would be for a considerable portion over the Midland Railway ?—Yes.

12,549. For instance it would go over your line to Rugby ?—Yes ; to Rugby for the London and North-western ; to Peterborough for the Great Eastern ; and to Nottingham for the Great Northern. All the collieries upon this list marked with a tick are collieries upon the Midland Railway, and the Commission will see what an immense number they are. If 20 additional lines were made into the coal district the coals would not go more freely on the respective systems than they do now.

12,550. (*Chairman.*) You stated, did you not, that from your own collieries towards Peterborough you would encourage coals being taken as much as possible on your own line ?—Yes, unless there is some equivalent given by the Great Northern Company. I say absolutely it would be manifestly unfair to compel us to divert that traffic by way of Nottingham instead of over our own line, although we have made arrangements with the Great Northern and the Great Eastern companies, who will take their mileage proportion of any rate which they themselves choose to charge, our object being to encourage the development of the coal traffic.

12,551. In all cases, if you make arrangements with other companies, do you get some equivalent from them in return for the facilities which you allow them for the coal being transported on their line ?—The coal trade is different perhaps to any other. The coal trade requires developing and sending to as many places as you can. Take the case of London. I believe that the sale of coals at Camden does not at all interfere with the sale of coals at King's Cross or at Paddington, and it is our interest not only to send all the coals we can to King's Cross, but all the coals we can to Camden. That is the interest which we have, because although we do not carry it over the whole length of our line, we have a certain distance,—to Rugby in one case and to Nottingham in the other,—and that is the advantage in the coal trade. With regard to ordinary goods traffic, we exchange with other companies on condition that they exchange with us.

12,552. Would the Great Northern give you any equivalent for allowing your coal to pass over their line to Peterborough ?—No ; but that was part of a general interchange of coal traffic between the two companies. There was a large district which the Great Northern Company had to supply with coals which we wanted to get at which they were supplying from South Yorkshire, and we said, now throw open your line to us and we will not exclude competing places.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Thursday, 22nd February 1866.

PRESENT :

THE RIGHT HON. THE EARL OF BELMORE.
THE RIGHT HON. LORD STANLEY, M.P., F.R.S.
THE HON. E. F. LEVESON GOWER, M.P.
T. B. HORSFALL, ESQ., M.P.
GEO. CARR GLYN, ESQ., M.P.
CAPT. DOUGLAS GALTON, R.E., C.B., F.R.S.
E. T. HAMILTON, ESQ., M.P.
J. R. M'CLEAN, ESQ., PRES. INST. C.E.
WILLIAM POLE, F.R.S., *Secretary.*

HIS GRACE THE DUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

S. Clarke, Esq.
22 Feb. 1866.

SEYMOUR CLARKE, Esq., examined.

12,553. (*Chairman.*) You are General Manager of the Great Northern Railway ?—I am.

12,554. Have you had an opportunity to read the evidence given before this Commission ?—I have.

12,555. Have you observed any statements in it affecting the Great Northern Company, upon which you desire to offer any explanations ?—I have been very glad to find that the complaints made against the Great Northern Company are very slight indeed, and that, in fact, they consist almost entirely of the complaints of Mr. Smith, a grocer, at Lincoln, and Mr. Gentel, a corn merchant, in the same town. I have, if the Commission desire it, replies to all those complaints in detail, and I think they are satisfactory ones.

12,556. Without going into any great detail, perhaps you can give an answer to the general nature of the complaints, for I believe they are all very much of the same character ?—Yes, they consist chiefly in alleged grievances ; for instance, that the rates are not equally charged to those two gentlemen, as compared with the rates that are charged elsewhere. Mr. Smith, a grocer, complains that charges are made for lumps of sugar which are different from the charges made for sugar in hogsheads, and he complains that boxes of grapes, which are small and comparatively valuable things, are not charged according to the same rate as onions ; but the details into which he has gone are so great that, although I can give an answer to them, I do not think I can generalize them more than that. In answer to question 9064, " Was not that altogether a matter of " accident ;" he says, " If the 8 lbs. of grapes had " been put inside the box of onions, and it had been " all entered as onions, it would have come down " under one rate ; but these are the advantages that " the railway companies take of us, which we think " to be an injustice." Considering the difference between onions and grapes, I should think it would damage the grapes very much if they were put inside a basket of onions. But the principle upon which we make charges to people of this class I will explain. This retail grocer lives in the upper part of the town, and those who know the town of Lincoln well will be aware that the upper part of the town is on a very great eminence as compared with the lower part ; but we make no extra charge for delivering this gentleman's goods, although he lives at the top of the hill, as compared with the man at the bottom. It might be perhaps a grievance on the part of the man at the foot of the hill that we did not charge him less than we charge Mr. Smith ; but we have to generalize things, and not to select any one man, and charge him any particular rate. With regard to the classification of goods, we follow, as much as possible, the order as laid down by the Act of Parliament, although we raise the charge sometimes upon one class, such as " bags of grain and meal, and the like ;" we class them, and charge them in bulk ; but if they are separate goods we are justified in charging them separately, always however within the maximum charge, and very considerably so in most cases.

12,557. The objection of Mr. Smith appears to apply to your classification ?—Yes, I dare say the clearing house book has been put in here ; indeed, it must have been because the inquiries which have been made are based upon the clearing house classification. I mean the returns that were sent to be replied to by the several companies ; the classification is, to a certain extent, no doubt known in this room. I have read the evidence, not only as applicable to the Great Northern Company, but in general, and the complaints against the classification I find are somewhat numerous. The classification as it now stands is

the result of the experience of a great many years; it is revised in the last month of each year, so as to apply to the succeeding year; but the variations which have been recently suggested in a conference of the goods managers of the different railways are very slight indeed. Nobody, I should fancy, would suggest that onions and grapes should be put in the same class.

12,558. You say there is an annual revision of the classification?—Yes, at a conference which is held of goods managers. The business of all railway companies is managed by a man occupying the position I do, who takes the general charge of the whole. Then there is the passenger department, of which there is a manager, but he is called the superintendent. Then there is a goods' manager; and the departments are large and numerous enough to require separate heads for the several branches. The passenger fares come under the constant revision of the passenger superintendent. The goods rates come altogether under the charge of the goods manager.

12,559. (*Mr. Glyn.*) The goods managers, I believe, meet frequently in a year to consult and make arrangements as to reductions of rates?—Yes; there are conferences for all sorts of purposes, for regulating the Liverpool traffic, for regulating the Manchester traffic, the suburban traffic of London, and the traffic of London itself. There is one called the "Normanton Con- "ference," which embraces the railways in that part of the world; this business cannot be conducted under one special head, the system is too large.

12,560. (*Chairman.*) On these occasions are any complaints that have been made in the interval taken into consideration?—Yes, that is the object of the meeting, to set things right that are complained of; for example, if goods fall in value, or if it is found that in carrying them there is more risk than was expected, or if application is made to the railway company as the carriers, that the goods may be admitted into a lower class, &c., but I may say that the variations now are very slight.

12,561. (*Mr. Glyn.*) Are these applications for reductions always considered at these meetings?—Yes, and I will give you an instance of it. A grievance was made on the part of the sugar trade in general; it was not only applicable to London, but it was general, and they invited a conference with the railway companies in general. We met them, listened to their grievances, and it was found that, to a certain extent, we were able to meet them. The complaint of Mr. Smith, the grocer, was met by an alteration that was made quite irrespective of him and quite irrespective of this Commission. The complaint that he made about lumps of sugar being of a higher class than sugar in hogsheads was met, and now we have no difference in charges for lumps of sugar as compared with bags or hogsheads of sugar.

12,562. (*Mr. Hamilton.*) Does it rest entirely with the goods managers who meet in conference to vary the classification?—No; all the acts which they do are subject to the revision of the general managers, and, if necessary, of course of the boards of directors.

12,563. Still there is no power outside the railway?—No, not while we are within the maximum. When we are below the charges authorized by the Act of Parliament under which we are constituted, then there is no appeal beyond what may be the common sense of the case made by the parties with regard to some grievance under which they may think they labour; there is the vexed question of terminal charges.

12,564. On what principle is the classification based, within the maximum amount, of course?—Not always.

12,565. On what principle is it based;—is it on the amount that a particular class of goods will bear?—No; the classification has nothing to do with the charge. There are some thousand articles, glue, glue pieces, glycerine, goats hair, gums, &c. These goods are grouped or classed, but they are not charged; there is no charge carried out for them. If you will look in the margin of the list, you will see that "yarn" is in the second class, but "woollen yarn" is in the third. White zinc is in the first class, but the class has reference always to the Act of Parliament and to the toll clause in it. Then each Company has, at its discretion, to put a certain price against these goods as chargeable from London to Manchester, or from Bristol to Liverpool.

12,566. But not necessarily uniform in any one class?—No; all goods in the accepted class, or in the accepted classification, are charged at the same rate between any two places.

12,567. Take Mr. Smith's case, on what ground was there a different charge as between onions and grapes?—Because they are in a different class.

12,568. (*Lord Stanley.*) What is the ground for a different charge being made for articles that are differently classified. Is it that the one are supposed to give more trouble to those employed on the railway or require more care than another?—There are two grounds for it; first, there is the care that is necessary, and the trouble and the risk, and then there is a clause in the Act of Parliament which gives power to the companies to charge different rates for goods of different values. I have our Act before me in which there are the "Regulations for the tolls;" the clauses in the Act are not the clauses which are adopted by the railway companies; there are goods in several classes which are below, or at any rate do not exceed the amount that we are justified in charging. In the Great Northern Act of Parliament the first class, which is the cheapest, refers to coal and coke, cinders, and things of that sort, and curiously enough the next article which justifies rather a larger charge begins with dung and manures, and goes on to a higher class of goods, such as bricks, slates, and things of that undamageable character. Iron not damageable, and damageable iron; that is, comparing pig iron with sheet iron. Finished iron is subject to damage; for instance, if we do not cover the goods properly, or leave them exposed to the weather, we are liable to parties for any damage done.

12,569. (*Capt. Galton.*) Then your classification does not agree with the parliamentary classification?—No; in practice it is found necessary that articles should be immensely more subdivided, and when I read some of the things that are mentioned in the Act of Parliament, and which are comprised in a very few lines there, it will be seen that there are many things which never occurred to anybody before, and it would be plainly impossible in a thing which is dealt with so laconically as an Act of Parliament to comprise those things. In the third class there is sugar, grain, hides, Manchester packs, woollen and calico goods, earthenware, timber, hardwares, and so on.

12,570. Does the classification in the Act of Parliament embrace everything in the clearing-house classification, or is something which might come under class 3 in the Act of Parliament placed under class 4, or class 5 in the clearing-house classification?—Very possibly; no doubt it is so.

12,571. Then no attention is paid to the classification in the Act?—No, except as to fixing the maximum charge.

12,572. (*Mr. Hamilton.*) Have you any authority in that Act of Parliament for departing from it?—If we go lower, certainly.

12,573. (*Mr. Glyn.*) The only thing that governs you as to the charge is the maximum toll?—Yes; we cannot go beyond that, but as much lower as we please.

12,574. (*Capt. Galton.*) Do you charge for everything in the several classes of the clearing-house classification exactly the same rate as between any two towns?—No; there are exceptions no doubt.

12,575. Then what is the object of the classification if you make exceptions and depart from it in your charges?—The object is to generalize the charges applicable to those several things, but there are circumstances which do justify these exceptions, and which all railway companies are obliged in questions of competition, and chiefly sea competition, to adopt; that is, they charge upon goods lower than they appear in the classification.

12,576. If you charge a lower rate for goods, say in class 3, than that class would command, you would not

Clarke, Esq.

22 Feb. 1866.

remove them from that class into the next lowest class, but you would deal with them as a special case ?—Yes, and make an exception.

12,577. If you had introduced an article from a low class in the Act of Parliament into a higher class in the clearing-house classification, you would, in order to avoid charging more than the maximum, put upon that article a special rate ?—The exceptions are invariably reductions. If goods are classed generally in class 2, class 3, or class 4, as the case may be, and it is desirable, as between any particular towns, in consequence of water competition, which is the chief competition, that an exception should be made by putting that article into a lower class, it is done so as not to upset the general bearing of the classification as it stood.

12,578. (*Mr. Glyn.*) Do you give that answer without exception when you say that it is invariably in favour of the public ?—There is no alteration from the classification that is not in favour of the public.

12,579. (*Capt. Galton.*) Do you never remove an article from a lower class to a higher one ?—Certainly we may do that, but then it would be by general arrangement among the companies.

12,580. That would be against the public ?—Yes ; but it would not be in excess of the Act of Parliament.

12,581. Do you ever remove an article from a lower class in the Act of Parliament into a higher class in the railway classification ?—Certainly, if it does not exceed the maximum that we can charge.

12,582. Then you would be limiting your higher class to the maximum fixed by the Act for the lower class ?—Yes ; but the operation of the classification is not to enable us to charge more than the Act justifies. We have no power to do that.

12,583. Suppose that between two towns you charged your full maximum rates, and that you raised one of the articles from the lower class in the Act of Parliament to the higher class in the railway classification, would you not be then limiting the whole of that higher class to the maximum which you could charge for the lower class ?—No ; that is not the operation of it. If the goods are classed generally, and there is an exception necessary in order to enable the companies to carry a particular article, say flour, between any two towns; flour is in the second class, and we should make an exception, and charge it at a lower rate than the second class, but that would not lower all the articles in the classification ; if we put an article in a higher class one year than it was found necessary to keep it in the year before, that does not of necessity put out all the articles that are in the same class with it.

12,584. You simply move it from a lower class to a higher one ?—The tendency is always downwards.

12,585. Then the classification is wanted simply for general qualities of goods ; you make numerous exceptions from it ?—Comparatively speaking they are not very numerous exceptions. The classification is made according to the rule established among the railway companies as to what charges should be made for goods, and they are so specified in the clearing house table which is before you. That guides all those parties in making the charges, and it is very essential that it should be so, because in cases where several companies carry to the same town, and in fact there are three or four companies now carrying to most towns of importance, such as Leeds ; the Midland Company carry to Leeds, the North-western Company, the Great Western Company, and the Great Northern Company carry to Leeds—a regulation amongst those four companies is established that goods of a certain class shall be charged a certain amount, and it is not competent to any one company to alter the class, or to put an article specified in the fourth class into the third class, as that would immediately result in competition between the companies, which I need not say is undesirable, and if possible to be avoided.

12,586. (*Mr. Horsfall.*) Have you any classification of terminal charges ?—Yes ; the classification of terminal charges is much shorter, and is established by the clearing house. 9*d.* is the terminal charge for the mineral class ; 1*s.* 6*d.* a ton is the charge for station to station traffic, which means not carted. In the clauses for carted traffic it is 4*s.* in the country, that is, adding 2*s.* 6*d.* for the expense of cartage ; in London the "carted" terminal charge is 8*s.* 6*d.*, which is 7*s.* added to the 1*s.* 6*d.* terminal charge in London for station traffic only.

12,587. You have no maximum by the Act of Parliament ?—No ; but there is a clause in all the Acts which says that those charges shall be reasonable.

12,588. You endeavour, in your own opinion, to make them reasonable ?—Yes.

12,589. But suppose the public consider that they are not so ?—Then they have an appeal ; they have the power that everybody has to appeal against improper or unjust things, anything done beyond the powers of the Act.

12,590. What power have they to appeal ?—They can appeal to a court of justice.

12,591. Is not that a very expensive process ?—It is, no doubt ; but if every individual had an opportunity of raising an action with regard to some box of onions or box of grapes that was sent to him, as in the case of Mr. Smith, and it was not an expensive process, the litigation would be very great indeed.

12,592. Is it not desirable that there should be either a maximum rate fixed, or where any parties felt aggrieved by any charge that was made, they should have the power of appeal by some less expensive process than a court of law ?—I think it is very desirable that it should be laid down and defined in some way what companies are justified in charging for terminal services, and then I would readily admit that there should be an easy mode of appeal provided against any excess being charged. The whole system of terminal charges is misunderstood by the public, and misunderstood in consequence of the original object for which railways were constructed not being adhered to. They were originally constructed as a highway upon which any man might put his own vehicles and his own engines, and of course find his own premises at the end of each line, whereby a man who wanted to carry goods from Manchester to Liverpool might do so at a certain scale of charge that might be made, and then he would have had to do his own services. But now that all railway companies are carriers they have to find premises in which to deposit the goods that are carried, and these are almost always expensive, because they are obliged to be provided in towns, and not in outlying places where land is cheap. Expensive buildings are erected, and the cost of labour and all the incidental charges are now borne by parties who cannot charge more than a certain sum. But when the railways were in the hands of the carriers, or rather if they had been in their hands now, their power to charge would have been unlimited.

12,593. You used the words, "by parties who cannot "charge more than a certain sum," but that is by their own fixing ?—The railway companies are bound to charge what is reasonable for the services performed by them as carriers.

12,594. Suppose that a person who forwards goods considers the charge made by the railway company unreasonable, do you see any objection to that person being enabled to appeal to the Board of Trade to appoint an arbitrator who should decide whether the charge made was reasonable or not ?—I think that unless the maximum charge for terminals when fixed was unreasonable, it would be very unwise for such a power to be given, because you would then have the Board of Trade sending down an officer to examine into the circumstances, and there might be in the course of a year 50 appeals about 50 different things.

12,595. You do not object to the maximum being fixed by Act of Parliament ?—No.

12,596. (*Mr. Glyn.*) Would there be any difficulty in getting together the necessary elements to enable

you to arrive at that maximum ?—No; I know what they are.

12,597. Could they be arrived at without any difficulty by all companies ?—Yes. No doubt you will recollect that in the year 1861 the question was taken up by Lord Redesdale, and it was referred afterwards to the panel of chairmen of committees, and many of those gentlemen are still acting. The evidence was placed before them, and they almost came to a conclusion. I think we wanted 2*s.* 6*d.* a ton, and I think that some of the gentlemen thought that 2*s.* was enough, but they never came to a distinct conclusion about it after the evidence was given. I believé a compromise was talked of of 2*s.* 3*d.* a ton. I have a map here that I wish to show to the Commission (*handing in and explaining the same*). This map has been published, coloured as you see, by an arrangement between all the companies; we find there the termini in London, and the colours on that map signify the distances within which the railway companies are bound to deliver goods ; this is the outside circle (*pointing to the same*), and the Commission will see that the railway companies now have an immense service to perform.

12,598. (*Lord Stanley.*) Are those colours explained ?—Yes; they are explained on the map. No doubt the tendency of each year is to put more burdens, by way of expense, upon the railway companies, which is very much the result of competition among themselves. Suppose, for instance, we carted to Woolwich, which we do sometimes, another company would then cart a little further, and so on, and the companies, therefore, amongst themselves, have determined that this shall be the scale—and a most liberal one it is—that is mentioned in this book.

12,599. (*Capt. Galton.*) What is the short cartage rate ; is that charge less than the 8*s.* 6*d.*?—Yes ; but then these charges apply only to station to station traffic, and not where the goods are carried without any division between the carriage to King's Cross station as the terminus, and Moorgate Street or Belgrave Square; it is all included in that charge, and there is no knowledge on the part of the public who receive the goods as to whether part of the ultimate expense to them is for cartage or railway carriage.

12,600. They pay the 8*s.* 6*d.* for terminals in any case, as I understand you, within the brown line ?—Yes.

12,601. If carried beyond the blue line, an extra rate would be charged ?—Yes; the map shows the charge that shall be made by the railway companies who own carts and horses. The Great Northern Company have 800 horses employed in the delivery of goods, and if goods are carried from any manufacturing place, or from any place, at what is called station to station rates, then supposing the consignees of the goods, instead of sending their own carts and horses, order the company to deliver them, they do make a small charge beyond the station to station rate contemplated in the Act, and those are the charges mentioned in that book.

12,602. (*Mr. M'Clean.*) The station to station charges are included in the mileage rate ; the 1*s.* 6*d.* is not a separate charge ?—Yes.

12,603. If you were allowed to charge a penny a mile between London and Birmingham for pig iron, you do not add 3*s.* to that rate, but the 1*s.* 6*d.* is charged by an arrangement between the companies?—Yes.

12,604. It is not in addition to the rate fixed in the Act ?—No.

12,605. (*Capt. Galton.*) Do you charge nothing for terminals for that station to station traffic ?—Yes ; practically we do, if it places the thing within the maximum. The terminal charge is included in the rate, and the reason of that is this : suppose that from Aberdeen to London there is a through rate chargeable, beginning at Aberdeen distant 500 miles, it flows over the Scotch companies' lines, the North British line, the North-eastern line, and our own ; and then any division of the charge made to the public for the carriage of those goods is made on the mileage after a deduction of the terminal charge, and therefore the company owning the terminus or station from which the goods go, and to where they arrive have the benefit ; what is then left is divided on the mileage.

12,606. That is to say, the person sending the goods pays only a mileage rate ?—It matters not to him whether the terminal charge is recognized or not.

12,607. But he has not to pay anything more than the mileage rate ?—No.

12,608. (*Mr. Glyn.*) It is an arrangement made between the companies ?—Yes.

12,609. (*Mr. M'Clean.*) Are the rates which are set forth in the Acts of the various companies uniform ?—No.

12,610. Then the object of the classification for through traffic is, to make uniform rates among the different companies ?—The object of the classification for through traffic is, that there may be an uniform way of charging these goods ; but then each company has to apply its individual Act of Parliament to justify the charges which it makes for the goods in each particular class.

12,611. It is necessary to have a classification of the through traffic ?—Yes.

12,612. (*Capt. Galton*) Is it desirable, now that there has been so much experience in the carriage of goods, to revise the parliamentary classification, and make it accord more nearly with the classification which is actually in force ?—I do not see anything against it, but it would amplify all the Acts very much if you included all these things, and there would be a greater difficulty, if circumstances required alterations to be made, in making them.

12,613. There would be no difficulty in making any alterations in favour of the public ?—No.

12,614. The only difficulty would be in making alterations that operated against them ?—Yes.

12,615. (*Mr. M'Clean.*) Might it not be included in a general classification in a general Act ?—Yes ; and in two or three recent Acts it was included. I recollect a case in which the Great Eastern Company wished to make a line through our district, as we term it, and they published a classification which was almost a transcript of that which had been agreed to among the companies.

12,616. (*Mr. Hamilton.*) Is the rate laid down by Parliament different in the case of different companies ?—Yes ; it varies, but not much. In some cases it is $2\frac{1}{2}d.$ per mile ; and in other cases $2\frac{1}{4}d.$; but they are very similar.

12,617. (*Chairman.*) In practice, is the same classification adopted by all the companies ?—Yes ; by all the companies.

12,618. Have you a greater number of classes in practice than are contained in the Acts of Parliament ?—Yes ; and for this reason : we have what is called the mineral class ; that is a small class, which is even lower than the first ; then there is the 1st, 2nd, 3rd, 4th, and 5th.

12,619. How many classes are there usually in the Act of Parliament ?—I think five classes ; passengers and horses are not included. I see that there are six, but the sixth is very exceptional, it is for fish, feathers, cochineal, household furniture, hats, shoes, toys, and other articles, matters, and things which are seldom carried ; they are mostly articles of bulk and of very little weight.

12,620. (*Lord Stanley.*) Of little weight, and but little liable to damage ?—Yes.

12,621. (*Chairman.*) How many classes have you according to the clearing-house classification ?—I think there are seven, including the special ; there is the mineral class and the special class, the classes from one to five.

12,622. As a general rule the charges in each class are uniform ; for instance, between the same two points I presume you would charge the same for coal and for coke ?—No ; they are not both in the same class. They are in the same class in the Act.

12,623. I understood you to say that as a rule you charged the same rates for articles that were in the

S. Clarke, Esq.
22 Feb. 1866.

same class?—Yes, but exceptions may come in, and coke is a very good instance to show the difference between that and coal. Coke is much lighter than coal, and coke is much more valuable than coal. Although we carry coals in full train loads at three-eighths of a penny per ton per mile, we add 25 per cent. to that charge for the carriage of coke.

12,624. Are there many important exceptions to the rule?—Yes, but they chiefly arise in articles which come in great quantities and at a low price.

12,625. (*Mr. Horsfall.*) Do you provide the waggons for the carriage of the coal and coke?—We find the waggons, but not altogether; if we find them we make a charge. By our Act of Parliament we are exempted from finding waggons for the coal traffic, but we have a great many; a large number of waggons are constantly employed, there are almost as many private ones as we own. If a coal owner finds his own waggons then of course he charges the public anything he pleases, to cover his cost, but if he employs our waggons we charge him, as between the collieries and London, 9*d.* a ton.

12,626. (*Mr. Glyn.*) Do you not find the terminal charges in London increased by the great demands that are made by large houses, and the competition which is produced by quick delivery, and the greater expedition which is required?—Very much.

12,627. Is not that increasing almost yearly?—Yes.

12,628. In determining the average charge for London, it would be almost impossible, would it not, to fix it without a revision from time to time?—Yes, if the extent of the area is increased, and no doubt with regard to London it will increase, and greater expedition will be required, as you have said. With regard to the goods which are entrusted to us to carry from places perhaps 200 miles away from London about seven o'clock in the evening, they are delivered at the consignees' doors, say in Wood Street or in Cheapside, and other places, the next morning, and in the case of cloth, for instance, it is delivered by nine o'clock in the morning, and if these things are not delivered complaints are made, and the parties wish to know why they have not been delivered. Fish and meat come up by the night trains, and they have to be delivered in the metropolitan sale markets as early as three or four o'clock in the morning.

12,629. (*Mr. M'Clean.*) Are you liable to pay for damage in case of delay or non-delivery?—Yes, if there is culpable negligence on our part.

12,630. (*Capt. Galton.*) But you do not bind yourselves, I believe, to deliver goods within any particular time?—No; but the practice prevails, and if we exceed the usual delivery time which practice has established, then we become liable. Some goods are carried at the option of the owners at their own risk, and then we make a reduction in the charge in favour of the man who chooses to take the risk upon himself.

12,631. (*Mr. Horsfall.*) Do you make any difference of charge as between a large and a small quantity of goods?—Yes, in some very few cases.

12,632. Do you make that difference in the case of coal?—We do not carry less than a truck load.

12,633. Then a person sending a truck load would be charged the same price as another person sending 50 trucks?—Exactly the same.

12,634. (*Capt. Galton.*) Could any individual in London have a truck load sent to him at three-eighths of a penny per ton per mile?—Yes.

12,635. (*Mr. M'Clean.*) You do not require the coals to be sent in train loads, but in truck loads?—For our convenience we carry them in train loads; but 50 different persons might send a truck, or one person consigned to himself, and we should carry them as cheaply as if they were contained in bulk. We should not carry a man's truck of coal from the north and run it up by itself, but it would form part of a general train.

12,636. (*Capt. Galton.*) Do you find waggons for all the traffic you carry?—For all the goods traffic, except where there is an interchange of waggon stock between all the companies. I do not mean for the coal waggons; we have 4,000 or 5,000, and the rest are found by the public; but then they have to be reimbursed for finding them in the charges which they make to the consumers of the coal.

12,637. In working the traffic with these waggons, what arrangements do you make to prevent delays; do you pay any demurrage if you have detained the waggons for an unreasonable length of time?—No; but in practice we are so desirous, in consequence of the value of space, to get rid of them and send them back, that that question never arises. If a coal owner, or the consignee of the coal, kept a waggon belonging to the company standing in a siding, and did not unload it, we should charge that man demurrage on the waggon.

12,638. You charge those parties demurrage?—Yes.

12,639. (*Earl of Belmore.*) Do you ever deliver coal in London?—Not by our own horses. At one time we were coal merchants, but some members of the coal trade brought the matter before the Court of Chancery, and we were debarred from dealing in coal, and the result of that was that the public in general had to pay about 3*s.* a ton more for their coals. At that time we had a contract for coal cartage, but we never delivered coals by our own horses; it is a slow style of horse, and our delivery horses are frequently obliged to trot; but the coal-drawing horses are heavy animals, and they can only do that work; we contracted at so much per ton with a large contractor to do that work.

12,640. (*Mr. Horsfall.*) How much per ton?—I think it was 2*s.* 6*d.* per ton.

12,641. (*Mr. Hamilton.*) For long and for short distances?—Yes, anywhere within five miles; if I recollect rightly I think that was the limit. Now the coal trade of the Great Northern Company has gone entirely, and it has fallen into the hands of merchants or agents to the colliery owners in the coal districts, and they employ their own horses and carts; we find the station.

12,642. Are you justified in saying that the practical effect of that change of circumstances has been to increase the price of coals 3*s.* a ton to the public?—I should not like to commit myself exactly to 3*s.* a ton, but I am quite sure that it has increased the price considerably.

12,643. Independently of other causes?—Yes; I think it is evident, because there was another profit to be made by the coal merchant.

12,644. (*Capt. Galton.*) Had not the Great Northern Company, when they were coal merchants, to make a profit just as much as the coal merchant?—No; we added the price to our charge; we contracted with the coal owners a year at a time at a fixed price, and then we added the charge for carriage and the price for delivery, and we supplied the public on a large scale.

12,645. Your object was then, I suppose, to get the carriage of the coal?—Yes.

12,646. You did not care about a profit on the sale?—No.

12,647. (*Mr. M'Clean.*) And the public got the benefit of that arrangement?—Yes. Although I should not like to bind myself to 3*s.*, I have no doubt that 3*s.* was the increased price the public had to pay.

12,648. (*Chairman.*) Had you not to employ and and pay additional clerks to manage the sales of the coal?—Yes; we did employ additional clerks, but to a very small extent.

12,649. Did you make no additional charge to the public on that account?—No.

12,650. (*Mr. Hamilton.*) Have you ever applied to Parliament to be released from that disability?—No. The question was tried, and it was decided against us; we were restrained from acting as coal merchants in consequence of its being held that we were not justified in applying the funds of the shareholders to the purchase of coal to sell again.

12,651. You say that the public have been damaged by the change. Have the railway companies been damaged?—No, I think not. I do not think it would be worth the while of any railway company, now that the coal trade of London is so very completely established, to go into that trade again. The great object was, when almost the whole of London was supplied with sea-borne coal brought by coasting vessels, to get rid of the prejudice which people had against using what was called inland coal, and in order to get the South Yorkshire and Derbyshire coal, and this has now extended itself into the Durham coal field, into London, we bought the coal, carried it at a low rate, and thereby established a trade. I believe that the large quantity of coal now carried by railway to London is attributable to what was done by the Great Northern Company.

12,652. (*Mr. Gower.*) Is not the increase in the sale of inland coal in London attributable to the appointment of the agents you have mentioned?—No; I do not think the increase is attributable to that. I believe it is the result of the public being satisfied that the coals are better carried by railways than by ships. It is a question of price, and up to this moment the price of coal in the Pool regulates the price at the railway stations.

12,653. (*Capt. Galton.*) When you carried the coals and you were coal dealers, did you carry them also for other people?—Yes; do you mean for coal merchants?

12,654. Yes?—Yes.

12,655. (*Mr. M'Clean.*) Did you carry them in your own waggons?—Yes.

12,656. (*Mr. Glyn.*) Did you at the same time take the risk of bad debts?—Yes.

12,657. Without any extra charge?—Yes, and it is a curious fact that the amount of bad debts that we made was quite inappreciable. We had a well-organized system of collection, and we professed to make our charges for ready money; the large bulk of our charges were paid for by ready money, but we had a large amount of them on our books.

12,658. Did your charges for collection come out of the tolls?—We charged only for carriage and delivery.

12,659. (*Chairman.*) Is no restriction laid down as to the number of agents who may come to your station?—It is only limited by space, but we are always increasing the space at King's Cross. This year we shall apply to Parliament to give us powers to buy a large tract of land at Holloway which is now green fields, and we are about to purchase that in order to make extensive sidings, so that there may be a depôt outside the limit of the station, which will be the selling ground for the coal, and the depôt to feed this selling ground will be outside the boundaries of the station.

12,660. (*Mr. Glyn.*) Do you admit traders generally into your depôt, or how do you let the drops?—We let the depôts, into which the waggons having moveable bottoms drop the coals into bays, because the extent of space is limited; we charge 2*d.* a ton for the use of the bays, but a very large amount of trade is done in shovelling the coals out of the waggons as they stand on the sidings on the ground.

12,661. (*Chairman.*) May any person come there and order a certain number of waggon loads of coal?—Yes.

12,662. (*Mr. Glyn.*) At the sidings?—Yes.

12,663. (*Mr. Horsfall.*) When were you compelled to discontinue the trade as coal merchants?—Seven or eight years ago.

12,664. What was the price of coal at that time?—I do not know.

12,665. I believe the price of coal in London is now materially lower?—No; I think not; competition may have reduced it again, but I know that the immediate result of the Great Northern Company ceasing to be coal dealers was a large increase of price to the public, although competition may have reduced the price again. I believe that one result of the railway company ceasing to carry coal at the low rates they did has been that very much larger prices are obtained by the fortunate owners of the coal.

12,666. (*Mr. Glyn.*) You think that the public do not get the full benefit of the reduced rates?—Yes.

12,667. But the coal owners and the coal merchants do?—Yes; the coal merchants' profit is altogether a new element of charge to the public.

12,668. (*Mr. Hamilton.*) Statements have been made by one or two witnesses that preferences are shewn by coal carrying companies in favour of some collieries as against others. Is that so or not in your experience?—Not as far as we are concerned; it is one uniform system for all. There was the case of Oxlade *v.* the North-eastern Company, and I believe Mr Oxlade still labours under what he considers to be a grievance.

12,669. (*Mr. Glyn.*) How do you manage your coal trade at the small stations?—We let the depôts chiefly to local coal merchants, but we deal with the coal owners; we carry the coal, and they are responsible for what we charge for carriage.

12,670. (*Mr. Hamilton.*) Do you allow all the colliery owners equally to supply the depôts?—Yes, all of them.

12,671. (*Capt. Galton.*) You place no limit on the number for whom you carry coal, which I believe is what the North-eastern Company do?—We allow anybody to send coals at an established price, but of course we are obliged to limit this at the country places where there is only a much smaller amount of coal traffic; consequently at our small depôts we limit it to four or five local merchants. But anybody who wants a dozen trucks of coals may have them, and cart them from the sidings; we have thrown the thing thoroughly open, and there are no restrictions.

12,672. (*Chairman.*) I believe the rule of the North-eastern Company is to let their drops to the coal owners, and I understand that the custom of your company is to let them to the coal dealers?—Not entirely so, for some of the drops in London are occupied by coal owners.

12,673. Is it not the practice of the North-eastern Company to let them to coal owners alone?—I think so. Among the senders of coal to King's Cross yard there is the Silkstone Colliery owners and the Elsecar Coal-owning Company, which is a combination of coal merchants in the South Yorkshire coal field. Earl Fitzwilliam is the owner of the Elsecar colliery. Mr. Newton Chambers and others, who are largely engaged in collieries, and they have formed themselves into a company for the purpose of sending coal to London. Another very large firm is that of Rickett, Smith, and Co.; they are coal merchants. I mention this in contradistinction to the coal-owning company, who are large consigners of coal.

12,674. (*Mr. M'Clean.*) Are Rickett, Smith, and Co. liable for the freight?—To us, no doubt, they are.

12,675. Not the coal owners?—No.

12,676. (*Mr. Hamilton.*) You say that in some of the country places you limit the right of supply to a few only?—No, I beg pardon, that is not what I intended to say, but I may have said wrong. I meant to say that in country places, where the accommodation in the way of coal drops is small, we are obliged to limit the occupation of those to four or five coal merchants, but anybody who likes to order coals may have them and cart them from the sidings.

12,677. From any colliery?—Yes, we have no restriction whatever; whether it is the Derbyshire coal, or the South Yorkshire coal, or the Durham coal, or the West Riding coal, we are glad of any coal.

12,678. Has the coal merchant to whom you let the drops the power of restricting the supply to a few collieries?—Yes, that is to say he may buy coal from anybody he likes; we cannot tell him that he shall buy from the Elsecar Company or from the Thorncliffe Colliery.

12,679. (*Mr. Glyn.*) At any rate your sidings are open to anyone?—Yes, to anybody.

S. Clarke, Esq.

22 Feb. 1866.

12,680. (*Mr. Hamilton.*) Virtually the arrangement as to letting the depôts to these coal merchants has the effect of restricting the supply to certain collieries ?—Hardly so. We do not let any one place to any one particular man, and if John Smith occupies one place and Tom Brown another they can deal with anybody they please, but if we are not the owners of the coal we cannot allow the coal to lie there under the ken of nobody; they must be consigned to somebody who is responsible to the coal owner if he sends them, and he must see that the coals are not stolen or carted away ; they lie there at his risk.

12,681. Yes ; but if your station master or other officer of the company acted as agent for the public, then any person might send in any number of trucks of coal consigned to your station master with a view to sale ?—Yes ; but these coals are carted away sometimes in donkey carts, and sometimes in barrow-fulls, in London and other places, and we could not allow the station-master, who has all the station work to attend to, to be an agent for selling coals by the barrow-full.

12,682. (*Chairman.*) Do you allow a coal dealer who carries on a small trade to keep possession of a depôt ?—Yes; but we have this power, that if we find a man does not do trade enough to justify his holding a drop we give him a month's notice that he must go, and if there is a more eligible coal dealer we give him a chance.

12,683. (*Earl of Belmore.*) But the man you turn out, I suppose, has still the power to take away coal from your sidings ?—Yes.

12,684. (*Chairman.*) Does the unlimited power of any person who pleases to order coals in the way you describe, ever cause a blocking up of your sidings ?—No, we cannot allow that. If a man is ordering coal in quantities greater than he can sell, we say you must not have any more till you have got rid of your stock. In the country places, and also in London in proportion, although the space in London is much larger, if two or three consignees of coal were to order each a dozen waggons when they pleased they would block up the station.

12,685. (*Earl of Belmore.*) Can you refuse to forward waggons of coal if you think a consignee has already more than he can dispose of ?—Yes ; I think it is an assumed power ; but practically it works fairly well ; of course, if a man chose to be obstructive, we could charge him for demurrage upon the waggons standing in the sidings ; we do not exercise the power, except for the general conduct of the business ; we show no favour to anyone.

12,686. (*Mr. Glyn.*) You only exercise that power to keep your line open and clear for the general traffic ?—Yes.

12,687. (*Mr. Hamilton.*) I understand that as regards the public the terminal charge is included in the rate per mile ?—It is included in it.

12,688. In fact the public know nothing about it ?—Nothing whatever.

12,689. Would there be any objection to making that a distinct charge ?—No.

12,690. I mean objection on the part of the railway company ?—No ; provided always that the charge was recognized ; but if we were bound to make a charge for the use of the station separate from the charge for the carriage of the goods, and there was no defined charge in any Act of Parliament or any authority under which we could make that charge, there would be endless disputes. We now say among ourselves that we charge 1*s.* 6*d.* for station to station goods, and if the rate is 23*s.* from place to place, 3*s.* are deducted before the 20*s.* that are left are divided among the parties, but the public do not care, and they cannot care, supposing that we are within the maximum, whether that 1*s.* 6*d.* at each end is deducted before the division is made between the companies. If there was no system of terminals charged, there could be no system of through rates, and if through rates were to cease the public would be damaged.

12,691. You say that there could be no system of through rates if there was no system of terminals charged, but you do not mean that a separation of them would interfere with the existence of through rates ?—No ; but if there was a subdivision between the terminal charges and the rates for the carriage of goods, it must be on some recognized principle that would enable companies to obtain payment.

12,692. Do you mean a principle laid down by Act of Parliament ?—Yes, and very much in the way that was proposed when Lord Redesdale and the panel of chairmen of committees took the matter into consideration. I believe that it dropped through in consequence of the strong opposition that was made by the coal owners in the Durham coal field.

12,693. You do not consider that such a separation of the charges would be prejudicial to the railway companies ?—No, not if it was once fixed by Act of Parliament.

12,694. (*Chairman.*) What was the ground of the opposition on the part of the Durham coal owners ?—Because it was a maximum charge ; they thought they would get it exacted in respect of coals, and a strong opposition came up from Newcastle and Durham, and the thing was not carried out.

12,695. (*Earl of Belmore.*) What is your general terminal charge for coal ?—9*d.*

12,696. For any distance ?—Yes ; that is the maximum charge ; our own charge in London is 2*d.*

12,697. (*Capt. Galton.*) Is the 9*d.* in addition to the three-eighths of a penny per ton per mile ?—No ; we do not charge 9*d.*, we charge 2*d.* for the use of the drops.

12,698. The terminal charge is not at present at all in excess of the maximum rate authorized by Parliament except in the case where you cart the goods ?—And then it is not.

12,699. What I mean is, that there is no additional charge made to the public in any case for terminal expenses above the maximum rate authorized by Parliament except in cases in which you cart the goods, and for which service you are authorized to make a reasonable charge ?—Not beyond the charge including the charge for delivery in London. We are within the maximum charge authorized by the Act of Parliament ; there is no such sum as 3-8ths of a penny per ton per mile there.

12,700. You make no additional charge for the coal, as I understand you, either for terminal charges or anything else, except for allowing people to use certain cells, and for that you charge 2*d.* per ton ?—Yes ; but then our charge is very much within what we are authorized to charge by the Act.

12,701. Practically if the Company was authorized to make a charge for terminals, it would be in addition to the maximum rate, and in addition to what is now charged ?—Yes ; and that would be regulated by the fact of whether we could get the price or not, but we voluntarily carry at very much less than the authorized charge. Suppose an authorized terminal charge were to be the law, we should not charge it, because we could not get it in consequence of the competition with the water, and that would prevent us. I think that a terminal charge would not be applicable to the London trade, but it would apply more forcibly to the charge made for the conveyance of goods between towns and towns, including London especially.

12,702. (*Mr. Hamilton.*) The charge to which I was alluding was a charge that I thought you said had been agreed between the railway companies should be fixed at 8*s.* 6*d.*, deducting 1*s.* 6*d.* ?—Yes ; making 7*s.*

12,703. What does that represent ?—Horses and carts.

12,704. (*Capt. Galton.*) And bad debts ?—Yes ; and everything of that sort.

12,705. Is that uniform and irrespective of the distance of the cartage in London ?—Yes, the 8*s.* 6*d.*

12,706. (*Mr. Horsfall.*) You stated just now that the proposal of Lord Redesdale and the panel of chairmen of committees was opposed by the coal owners ?—Yes.

12,707. Was it not also opposed by the Great Western Company ?—I do not recollect that it was,

because, if I recollect rightly, the Great Western Company were concurring parties.

12,708. Have you any information upon which you found that opinion?—No. I know that I was examined about the charges, and I know that I gave evidence on one or two occasions for the Great Western Company in respect of the terminal charges; I think you will find that the Great Western Company would concur, and that the other leading companies would concur in having a maximum terminal charge recognized.

12,709. (*Mr. Glyn.*) If they did differ it arose upon the question of whether it should be 2*s.* or 2*s.* 3*d.*?—Yes.

12,710. You stated, I think, that Lord Redesdale and the panel of chairmen of committees nearly came to an agreement with the railway companies?—Yes.

12,711. But the Durham coal owners opposed it. Do you know upon what ground?—I think they were afraid that an exaction would be made in respect of the terminal charge that was not then made, and in an answer I gave to Captain Galton's question I said that it would not apply, because our charge is now so much less than the maximum charge, not because we have not the power to charge, but because our policy is to carry large quantities at low rates. The coal trade has been much developed since that time.

12,712. (*Earl of Belmore.*) You stated that the maximum terminal charge for coals was 9*d.* a ton; in what sort of case was that?—In a very short distance there is a coal field which we abut upon at Doncaster; and suppose, for example, we carried coals for the first two or three stations out of Doncaster, say five or ten miles, of course the waggon has to be used for a much less distance on the railway; the engine power has to be exercised for the purpose of carrying these coals four or five miles, and in those cases no doubt we do charge the maximum.

12,713. In cases where you employ your locomotives to take coal trucks from the private sidings of the coal owners, would you charge a higher maximum than 2*d.* a mile for coal coming to London?—No; not if it was carried for a through rate. I will endeavour to make that more clear; if the siding connecting the collieries with the main line of railway is of any length, of course the coal owner must either, by his own locomotives or by horse power, bring the coals to the siding that is parallel with the line of the railway. We never could leave part of the load on the main line, and run up to a colliery to get his 20 waggons out, for in that case the whole of the traffic must be stopped; the man is bound to bring his coals to a siding parallel with the main line. Then we leave the train under the protection of the telegraph signals, and detach the engine; we then hook on his waggons, and get them out in that way.

12,714. The charge of 2*d.* covers the terminal at both ends?—There is no terminal in the country, and of course, as I think you will understand, where goods have to be carried these short distances, the powers of the Act of Parliament are put into full operation, and it is a much less charge than if horses and carts were used.

12,715. (*Chairman.*) In those cases your total charge for a short distance would be above what you can charge by the Act, unless you take into consideration the terminals?—In some cases it would be so; but then comes in the question that I suggested before, that the original intention of railways was that other people might carry on them, and then of course they would find their own premises.

12,716. (*Mr. Hamilton.*) How long have you been carrying coal at three-eighths of a penny per ton per mile?—I should think for four years.

12,717. Is that a uniform rate for all distances?—No; of course it applies only to long distances, because the engine starts capable of exerting a certain power, and if it exerts that power for the whole distance, the full benefit is obtained for the company; but if half the load is left, say at half the distance, and another quarter of the load is left at an extended distance, when the engine come to the end of its journey it is exerting all its power for the purposes of a quarter of a load.

12,718. Within what limits does that apply; to what place, and from what place?—I would say York for the Durham coal. I think it is slightly above three-eighths of a penny per ton per mile from Doncaster; it is rather more from Derbyshire, because the distance is less.

12,719. What is the minimum distance in miles for which you would charge three-eighths of a penny per ton per mile?—The minimum distance is the whole length of the line, which is now 191 miles from London to York. We charge three-eighths of a penny per ton per mile for the coal delivered at Peterborough to the Eastern Counties Company, because that constitutes a part of the through distance, and we employ an engine to come from the north to finish at Peterborough, and go back again with part of the waggons. We have so regulated that that we do get the full power of the engine out of it; if the coal is only carried from the coalfield to Peterborough the Eastern Counties Company takes it on, and the charge is the same.

12,720. That is for the shorter distance?—Yes, but there is the operation of the engine there and back.

12,721. (*Capt. Galton.*) In each case you divide your line at Peterborough, therefore if you run your coal to London you run one engine to Peterborough from York, and next from Peterborough to London?—Not always; we do in delivering coal to the Great Eastern Company.

12,722. With your own coal trains, do you bring one engine through from York to London?—Not universally; we subdivide some of the trains at Grantham, some at Peterborough, and some at Doncaster, but that is in accordance with the convenience of the locomotive department.

12,723. Have you made any calculation as to the profit you make in carrying the coal at that rate?—No, but there are those who hold that it is carried at a loss at those rates. I do not entertain that view. I cannot tell you what the profit is of carrying a full train of coals at three-eighths of a penny per ton per mile, but it is a profit that satisfies us on our coal traffic.

12,724. (*Mr. Glyn.*) What is a full load?—With the new sort of engines that we use now, that is, making the tender available for pulling as well as for carrying water, by throwing the spare steam into a pair of cylinders on the tender itself, we carry 45 waggons; they hold 7½ tons, and they weigh 4½ tons; we carry 40 times 12 tons with one engine.

12,725. What is the weight of that kind of engine?—33 tons, not including the tender, or I think I may say 35 tons.

12,726. (*Mr. Hamilton.*) You would not be able to carry coal at that rate, but for the great improvement that has taken place in the mechanism of the locomotive engines?—We carried at three-eighths of a penny per ton per mile before this additional mechanism was put on the tenders.

12,727. (*Mr. Glyn.*) It makes a difference in the profit, does it not?—Yes, and in the occupation of the line; the great advantage with these additional engines and tenders is that there are fewer trips, and therefore they are more readily put out of the way in the sidings that are provided, and in the conduct of such a very large traffic as we have the coal traffic must give way to any goods trains; and again the goods trains are shunted into long sidings to let the passenger trains go by.

12,728. (*Mr. Hamilton.*) How much do you consider the power of the locomotive has been increased?—About 30 per cent.

12,729. And that the public owes very much to the open competition that has existed?—The general price of three-eighths of a penny per ton per mile is no doubt attributable to the competition between the sea borne coal and the railway borne coal.

S. Clarke, Esq.
22 Feb. 1866.

12,730. I mean that this improved locomotive is owing to the competition that has existed, and the necessity which railways were under of carrying coal at a reduced rate?—Yes; and it is more especially due to the necessity of having the line more readily cleared; the time taken in the case of a coal train is very much larger than that of a goods train, and very much larger than a passenger train.

12,731. (*Mr. Glyn.*) Does not that also arise from the fact that railway companies desire to economize the cost?—Yes.

12,732. And they are doing that month by month?—It is the constant aim of the locomotive engineer to decrease the price of his train per mile, that is to say, the expense at which he can carry a train for a mile, whether by the improved combustion of coal in the engines, or whether by any increase in the size of the cylinders or the fire-box, or the perfection of working the locomotive.

12,733. Do you know the present cost per train mile of carrying coal?—No; but the general cost of the engine is about 11½*d.*

12,734. (*Chairman.*) That is the cost of the engine alone?—Yes.

12,735. (*Capt. Galton.*) Does that apply to the whole of your engines?—Yes.

12,736. (*Chairman.*) Do you consider that a coal engine is above the average?—No, not very much.

12,737. Not more than a passenger engine?—No, because it travels so much more slowly; the wear and tear of a slow-going engine is less than the wear and tear of a fast passenger train.

12,738. (*Earl of Belmore.*) How many more trucks can one of the improved engines draw?—About 30 per cent.

12,739. (*Capt. Galton.*) How many miles do the engines run a day?—Never exceeding 200 miles. I meant my former reply to be in reference to the main line. We do not get nearly so much as that out of the short branches, six or seven miles long.

12,740. (*Mr. Horsfall.*) What amount of saving is effected by using coal in place of coke?—There is a saving, but whether it is 12 or 15 per cent. I am unable to say.

12,741. (*Lord Stanley.*) Is the substitution of coal for coke legal?—I am told that actions will lie against railway companies for not consuming their smoke, and we do profess to consume it.

12,742. (*Capt. Galton.*) Provided you consume the smoke there is no objection to the fuel you use?—No.

12,743. (*Chairman.*) Do you generally use coal for passenger trains?—Much more than we did.

12,744. With a proportion of coke?—Some coke; coal is almost exclusively used in the coal and goods traffic; the fire-box is made to consume the smoke from coal as much as possible, and to consume coke.

12,745. I believe you are not able to state what the cost to the company per ton per mile is, of conveying that coal for which you charge three-eighths of a penny per ton per mile?—No, I am not able to state it here.

12,746. Have the railway companies the means of ascertaining what it is?—Yes; it is capable of being estimated, but there are many elements to be taken into account, not only the cost of the engine, but there is the cost of the repair and maintenance of the line and renewals chargeable to revenue from time to time; and there is more wear and tear on a railway in carrying a heavy train of coal than in the case of a passenger train; the latter goes faster.

12,747. (*Mr. Gower.*) Must you not also include the cost of the return trucks?—Yes, everything.

12,748. You make no use of them, do you?—No, in the case of some of our own we do; but we cannot use the coal owners' waggons; they must go back empty; we load dung back, in some cases, in our own waggons.

12,749. (*Mr. Glyn.*) Is that the only instance?—Practically, we must keep the coal trucks in a state of constant pendulation between the collieries and the selling places, or a delay will take place, and delay means expense.

12,750. (*Earl of Belmore.*) You stated that three-eighths of a penny per ton per mile afforded you a profit. Did you mean by "profit" a profit over and above the working expenses, or a fair profit in the sense of a commercial profit on the capital invested?—It supplies a part of the dividend that we pay; it yields a profit over and above the working expenses.

12,751. You might carry, with a view of increasing your general dividend from other sources, without reference to the profit on that particular branch of trade?—It would not have that effect. If we carried at no profit, we should either charge so as to stop the trade, or the public would pay more; it bears a fair profit, and we are paying a fair dividend now; no doubt it contributes towards it, but not so well as the passenger traffic.

12,752. (*Chairman.*) Do you think that the expenditure under the head of "permanent way," is attributable more to the mineral traffic than to the passenger traffic in proportion to the mileage?—I am sure that there is more wear and tear in crushing the rails as the weight passes over them in the case of the coals.

12,753. (*Mr. Gower.*) What number of empty trucks can one engine take as compared with loaded trucks?—50 or 60 empty waggons as compared with 30 or 40 loaded; but that is limited to a great extent by the fact that we are obliged to put empty trains in sidings on the down journey as we take the full trains up for the more quick traffic to pass, and the shunting sidings will not hold more, and over-long trains are unmanageable; if you get a longer train than that, as the guard rides in the end van, if any communication has to be made between him and the engine man, whether to go on or to stop, it is almost a journey from one end of a train like that to the other.

12,754. (*Mr. Horsfall.*) Has your company considered the question as to the practicability of carrying passengers with more safety than at present by any system of communication between the guard and the passengers?—Yes, we have considered that matter very much. I was one of a committee consisting of the managers of the leading railway companies who went into that question after the murder of Mr. Briggs, and we examined nearly 193 inventions, some of them patented, some of them registered, all of them considered very clever by the parties. We did not find one of them that was practicable, the best of them was so delicate that I doubt whether it will succeed; it is an electric communication between the guard and the driver and the guard and the passenger; it is now in use on the South-western line, and it was only within a few days past that the directors of our company, after having considered this mode of communication, authorized its being tried, and we are now going to test it upon long traffic. It is more easy, however, to do it in a self-contained system like that of the South-western, where they do not detach the carriages at junctions; but I have always thought, and still think, that it will fail, if it fails at all, at the junctions where we detach the carriages. We shall try it on the trains running between Leeds and London; we detach at Peterborough the Lincoln carriages, and we detach at Grantham the Nottingham carriages; at Retford, the Manchester carriages; at Doncaster, the Wakefield carriages; and the main part of the train goes to York. If this invention will stand that test it will stand anything.

12,755. How will the passengers have access to this telegraphic communication?—There is a small circular glass placed in each carriage, inside which there is a small ivory knob, which, as is commonly the case, is depressed to place it in circuit, and that communicates with the guard; and the guard has another electric arrangement between his van and a sort of whistle or bell on the engine.

12,756. I suppose one great objection would be the probability of a passenger being unnecessarily alarmed and stopping the train without any necessity?—Yes. The managers who met together and discussed the

matter made a report, and very much at my instance this was added—that it would be impracticable to put any plan into operation until there was some legislative enactment which imposed penalties on parties who wantonly put the signal into operation. Without that I firmly believe that the remedy would be worse than the disease; for if we had frightened or timid people stopping the train because they thought that it oscillated a little too much, the chances are that collisions would constantly take place.

12,757. (*Mr. Hamilton.*) You say that it is in use upon the South-western line. What has been the experience of it there?—They have tried it for some months. I believe it has been tried twice, and on those occasions it was tried by officers of the Board of Trade, who did test it, and on one occasion Colonel Yolland was threatened that he should be taken into custody for doing it. It has been at work for some six or seven months.

12,758. The experience that has been gained did not lead, did it, to the apprehension that it would be wantonly used?—No. I do not think it is known yet that it is at work; but if it was established throughout the length and breadth of the land, and people could stop the trains, I am afraid that nervous people would do so, and that accidents would occur.

12,759. Have you seen it in the South-western carriages?—Yes.

12,760. Are there directions explaining how it is to be used in case of accident?—Yes, no doubt there are.

12,761. Is there any doubt that a passenger would understand how to use it?—I think it is put up experimentally, and I do not believe that there is any conviction on the minds of the travelling public that they can stop a train if they are so minded; it is only generally used in their long Portsmouth trains. I have seen them at Barnstaple.

12,762. (*Earl of Belmore.*) Is it practicable in this country, as in France, to enable the guard to communicate with the carriages, without stopping them, by means of a hand rail outside?—I think not. We fitted up a train some months ago with the foot boards outside, approaching each other so nearly as to allow for the buffing in the trains when they stop, and so that the guard could step from the end of one footboard to the end of the other, and we put round brass hand rails for the whole length, so that a man could get along. I dare say the men could be induced to do it, but I am satisfied, considering the numerous trains that we run and that pass each other, that accidents would constantly happen. There is another thing which has been very much commented upon as being good for the public, and that is the American plan of having a passage carried through the carriages. I think that that would not do in England. I fancy that passengers would not like to be subject to anybody walking through the carriages, especially for long journeys.

12,763. (*Mr. Glyn.*) Was it not stated in a report on the French railways that the practice of having hand rails was going to be stopped in consequence of the number of accidents which had occurred?—Yes; and since that I have seen in the newspapers that there has been an order issued by the Minister of the Interior that a system of signals should be adopted, but it is not, I believe, in operation yet.

12,764. (*Capt. Galton.*) Do you think that any legislative enactment besides this could be usefully made to promote the safety of the travelling public?—I think not, because the great object that all railway companies have is to carry the public as safely as they can. I consider the system according to which damages are levied is a very unfair one.

12,765. In what way?—Because any man can insure his life from accident, and we yet are liable to pay a man, who has perhaps, 100,000*l.* a year, compensation in case of accident, in proportion to his income, although he takes no more precaution for himself than a man with 100 pence a year.

12,766. Would you limit the amount that should be paid as compensation in a case where no insurance had been effected?—Yes.

12,767. But you would compel the companies, I suppose, to insure to any amount?—I think that some such suggestion might be carried out. I think it is desirable that the amount of the pecuniary liability should be fixed.

12,768. (*Lord Stanley.*) You know, I suppose, that the principle upon which compensation is adjusted is the same as that which applies to all other accidents; it is part of the general law of England?—We are mulcted under Lord Campbell's Act, and in the case of Mr. Pimm, who had a considerable income, and 9 children, we were made liable for their maintenance, and I think it cost the company 10,000*l.*, whereas, if he had had but one child, we should have had to pay much less.

12,769. (*Capt. Galton.*) Is it not the case that although you are limited as to the amount which the company can charge for a passenger ticket, the amount of compensation which you have to pay in case you injure the passenger, is unlimited?—Yes.

12,770. And you cannot protect yourselves by requiring persons who are of great value to pay a higher rate than those who are of smaller value?—No.

12,771. (*Mr. Horsfall*). Is not Lord Campbell's Act a part of the common law of the land bearing equally upon railway companies and ship owners?—I do not think it bears on ship owners.

12,772. (*Capt. Galton.*) Is it not the case that the shipowners are limited, as to the amount of damage they can pay, to the value of the ship?—Yes; I believe that so much per ton on the ship is all they can be called upon to pay.

12,773. (*Mr. Gower.*) Does not the unlimited liability contribute to the safety of the public?—I think not; if the amount of the compensation was limited I do not think we should be one jot less careful.

12,774. (*Earl of Belmore.*) Would it be in your power to put into operation as to passengers the same system that I think you said was in force as to goods, and charge a higher fare for a person who travelled at your risk, and a lower fare if he travelled at his own?—I think that that is quite capable of being carried out; If we are justified by the Acts of Parliament in charging 2*d.* per mile for carrying the man, if we charged something more and took the risk, that I think would be a reasonable contract between the company and the public.

12,775. (*Capt. Galton.*) In that case you would pay, in case of an accident when it was owing to your negligence?—To the maximum amount I think we should.

12,776. (*Mr. Hamilton.*) Practically, what is the largest sum you have ever paid in one year on account of compensations?—I do not recollect, but I can tell you what we have paid in the last half-year but one. We paid in the half-year ending June 1865 as compensation for accidents and losses, including law costs, 9,627*l.*

12,777. And what were your profits in that half-year?—We paid 7¼ per cent.

12,778. What was the amount of your profits?—In the net revenue account of the half-year ending June 30th, 1865, there was a balance of profit of 264,000*l.*

12,779. In six months?—Yes.

12,780. (*Capt. Galton.*) Did the compensations paid by the company include the goods as well as the passengers?—Yes; but the bulk of it was for passengers.

12,781. (*Chairman.*) Is the amount you have given about the average sum?—We paid in the year 1865 24,000*l.*, the capital of the company being 16,065,000*l.*

12,782. Do you consider that any arrangement could be made by which the punctuality of trains could be better secured than at present?—The difficulty as to punctuality is of course the speed at which the trains go, and the load that they carry; the public have such a desire to be carried quickly that punctuality can only be met, not merely by diminishing the speed, but by lightening the load, and we have it now

S. Clarke, Esq.
22 Feb. 1866.

in contemplation to duplicate the express Scotch trains and the Manchester trains from the 1st March, so that we shall have something like a margin to come and go upon.

12,783. You mean that you will send two trains to Scotland instead of one?—We contemplate sending two trains at 10 o'clock, and two trains at 5 o'clock during the summer, and I think we shall send two 12 o'clock trains, and two quarter to 3 trains when the Scotch traffic sets in; we often send two night trains.

12,784. Do you keep tolerably good time in the autumn?—It is worse in the autumn. We kept time, I admit, badly last year, and the directors, on my recommendation, have made up their minds to duplicate more of the trains than they did in the autumn of last year.

12,785. Do you consider that any legislative enactment could be passed which would improve the punctuality of the trains?—The result of it would be that the trains would go slower.

12,786. (*Mr. Glyn.*) Do you not find that the luggage which passengers carry with them at the time of year to which you are referring is the cause of delay?—Yes, it is occasionally, and we shall meet that by running shorter trains, which will be more easily handled, so that there may be an opportunity of recovering lost time at any particular station, where a crowd of people and luggage sets in.

12,787. It has been suggested that the safety of the public might be increased by the government having power to put inspectors upon lines of railway to inspect the permanent way from day to day, and to report upon it. Do you think that the vigilance of companies would be increased by that precaution?—I think that the result of an inspection established by the government would be to place the responsibility on the government, and would relieve the company of the liability which now attaches to them.

12,788. Practically, the necessity of keeping their own permanent way is so much for the advantange of the company themselves in working, and for their own emolument, that they cannot well neglect it upon the principal line?—I think not. I think that the line is kept up in a high state of perfection.

12,789. Have you a staff of inspectors for the purpose?—Yes; everywhere.

12,790. Who go day by day over the line?—Yes; every day. Each man, the foreman of a length, as it is called, walks over his portion of the line every day. I find that for the last half year ending the 31st of December, 1865, we spent on the permanent way 97,058*l.* and in the previous half year, so that the total may be before you, we spent 90,126*l.*

12,791. (*Chairman.*) How many miles have you?—The number of miles maintained is 434.

12,792. Does that include the sidings?—No; it does not include the sidings in the length I have given you; it does include the amount for maintenance; the 434 miles of railway have been maintained during that period out of that money.

12,793. (*Mr. Hamilton.*) Do you suppose that all other large companies could give equally satisfactory evidence of their attention to the state of the line?—I think the companies who are in a good condition could.

12,794. What do you mean by companies being in a good condition?—Who are paying a fair dividend.

12,795. That is just the point as to whether the security of the public is to depend upon the amount of the dividend?—I am afraid that it has been a practice in some few cases to try to reduce the expenses below what they ought to be in order to make a better financial statement at the end of the year; but I am quite certain that it is bad economy.

12,796. (*Chairman.*) You probably observe that many witnesses have expressed a strong opinion in favour of uniform mileage rates, both upon particular railways, and many of them in favour of a uniform mileage rate over all the railways in the kingdom; what is your opinion upon that point?—It is quite out of the question; it would have the effect of making the charges so high in some cases that the traffic would not be carried at all, or else it would make the short distances so low that they would be unremunerative, and I am quite sure that the interest of the public in general would be very much damaged by such a system as that.

12,797. Is uniformity your principle where there is no reason to depart from it?—Practically, it is so.

12,798. But the exceptions are probably very numerous?—I do not think that I could use the term "very numerous." Of course the exceptions are numerous. As I said just now the chief cause is where the competition of water sets in and where there is a particular trade which has to be fostered by carrying larger quantities at small rates.

12,799. (*Earl of Belmore.*) The effect of such a system of uniform mileage would be entirely to destroy competition in cases where you have to meet with water competition?—Yes, it would stop the trade. If we were bound to charge a certain sum and the public would not pay it, of course the traffic would be stopped, and then they could only have recourse to the water.

12,800. And probably the owners of the water communication would raise their rates?—No doubt that would be the result; whereas as it is now, a wholesome competition is established. And then I think it would be very strongly felt indeed in the short distances, because if we were bound to carry for long and short distances at the same rate, and we elected to carry long traffic at a low rate, and we were bound to carry short traffic; we should then elect not to be carriers (and it is competent to us to do so) between those short distances. Then parties might put on their own conveyances on the line under the constitution of the Acts of Parliament if they were so minded for the purpose of the short distances.

12,801. That would very seriously interfere, would it not, with the working of a large line of railway like yours?—Yes, very materially, of course, and it would very seriously interfere with the very large number of people who live in the district that we serve.

12,802. (*Lord Stanley.*) There has not been practically any demand made upon your company for a uniform mileage rate,has there?—No.

12,803. (*Chairman.*) Do you think that the result of competition between railways has on the whole been to reduce the fares and charges to the public?—I am sure it has.

12,804. And you think that for a time competition goes on, but that in a short time the two companies agree to charge common rates?—They seldom come up to the old rate again. I was very much struck with the evidence of one gentleman, whose name I forget; he said there had never been known a case in which a rate got up again when it was once reduced. That is not quite true. No doubt when rates have been low they do not go up to the price they were before the competition arose.

12,805. How do you explain that when two or more companies who have competing lines to the same place have come to an agreement they do not revert to the old high charges?—I think it is because the public would feel themselves very much aggrieved; the companies having elected to carry at those low rates they would think that they could do so still and make a profit out of them, and that it was very hard upon the public to put the rate up to what it was before.

12,806. You do not like to do anything which would be very offensive to the public, and give a cause of great general complaint?—No; we are indeed the humble servants of the public.

12,807. You stated, did you not, that the competition between railway companies had tended to reduce the cost of conveyance from the railway termini in London to the outskirts?—No; it has increased the area and increased the cost to the companies in doing it.

12,808. Do you think that it would be possible for Parliament to introduce any measure that would facilitate the interchange of traffic and through booking between different companies?—Where they form a continuous route it is done so generally now, and I do not think that any parliamentary enactment is necessary; the traffic of the kingdom is principally carried at through rates.

12,809. (*Capt. Galton.*) We have had evidence that great inconveniences have resulted at a certain station which enables people to get from Bedford on to the Great Northern line; would any legislation, do you think, enable grievances of that sort to be corrected?—It might; but with respect to that very case (I am glad that you have mentioned it), I never heard of it until it appeared in print in the evidence before this Commission, but it so happens that it is chiefly in fitting the trains that the grievance arose. It is the cross country traffic.

12,810. Through booking was one point of complaint?—That may be so, but wherever a company is willing to book through with us, we are always willing to book through with them. I think you will find that the place referred to was Sandy, and that it was a Bedford gentleman, Mr. Howard, who found a grievance because our main trains up and down do not quite fit in with the cross country single line trains on the Bedford and Cambridge line; and that he had been put to this inconvenience; but that was the first time I had ever heard of a desire to have this through booking, and now it is established.

12,811. You will remember that some time ago it used to be a very common complaint that one company who was hostile to another would obstruct the traffic of another company; do you think that that practice still exists in the railway world, or has it gradually been discontinued, and do the railway companies now afford full facilities to the passenger traffic of all companies with which they come in contact?—Yes, those days are very much gone by, and I will add to your remark, for goods also.

12,812. (*Mr. Glyn.*) Whenever it occurs that a cross train does not happen to fall in with the main branch lines of any two companies, it is not because they fix their hours on purpose that they should not connect, but because the main traffic on the principal branches traffic will not allow to connect them, is not that the case?—That is quite so.

12,813. (*Mr. Gower.*) Take the case of getting from your line to Lincoln. I see that at Newark your morning train arrives at 11.55, and that the Midland train to Lincoln leaves Newark at 11.53, two minutes before. Is not that a very great inconvenience to the public?—Yes; but then you must bear in mind the fact that the stations are not the same, and that it would take nearly 20 minutes to get from one station to the other, so that it is not a question of two minutes or three minutes as it appears. There is a further question of certainly 20 minutes, in order to make a passenger who wanted to go, for instance, from Peterborough to Newark in order to catch the Midland train sure of catching it. And then that two or three minutes is not established, as Mr. Glyn says, because the companies want to interfere with each others' traffic, or want to prevent traffic flowing over the other line, but because the Midland train starts from Nottingham and goes to Lincoln, and it may have to run from a train that comes from Derby, or from any other place, and it cannot start until the Derby train is in. Then of course our trains work from London to Scotland, and London to York, and we could not keep our train back to meet trains at the several junctions of other companies that we go through. We fit our own branch trains, and it really is a matter that is not possible to regulate so as to avoid discrepancies of that sort. Of course if we can we meet them, but our train which goes from London to Aberdeen of course has to perform its journey in a certain time, to catch the trains of the North-eastern Company. We only run to York, the North-eastern Company go on from York to Berwick, and the North British Company go on from Berwick to Edinburgh, and then we have got to catch the system of Scotch trains, which go to Inverness or to Aberdeen, and it would never do for us to say that we would stop our train to make it fit in with the Midland train, which only pendulates between Lincoln and Nottingham.

12,814. In your opinion, if all railways were under one management, would such inconveniences exist equally?—Yes, they cannot be avoided; if you have got to serve a very important line of communication, and to make other trains fit in, it would be impossible to do it throughout England.

12,815. (*Capt. Galton.*) Do you run trains to Cambridge now by Royston?—No, not till the 1st of April, when the 14 years' agreement lapses and we do not renew it.

12,816. Is that line in your hands?—It will be, it is our own property.

12,817. (*Mr. Gower.*) You do not think that this arrangement of trains is for the purpose of forcing the public to come from London to Lincoln by the Midland line?—No, certainly not.

12,818. But has it that result?—No, I do not think it has; they have only to wait for the next train.

12,819. How long would they have to wait?—I have not that in my mind.

12,820. About two hours, is it not?—In that instance it may be so; I have no doubt you are right if you have the table before you.

12,821 (*Capt. Galton.*) Your argument would be that the cross line traffic should accommodate itself to the through traffic which is run through to the north?—Yes, I will put it a little higher. The Midland train from Nottingham to Lincoln is in connexion with Derby or the Willington junction, and that is in connexion with the through train from Carlisle to London; the Midland Company work their train as well as they can, and we work ours as well as we can. They cannot start the branch train from Derby to Nottingham till their train reaches Derby, of course, because that would be useless, but their train does not start from Derby to Newark through Nottingham in sufficient time to meet ours; and you would never contend that the through arteries of communication were to be made subservient to the cross country trains; that would be out of all reason.

12,822. Can a passenger book through from Derby to London by way of Grantham?—No he cannot.

12,823. But the trains run so that he could proceed in a reasonable time that way, do they not?—Then he would have to book locally.

12,824. He would have to book at Nottingham?—Yes, certainly. The answer is that if a man wants to go so many extra miles, because he would be a great many miles out of his course, he cannot expect to have the same convenience as if he went by the most direct route, but to any part on the Midland system, or the Eastern Counties, towards Cambridge, for instance, they pass freely all over our system.

12,825. (*Chairman.*) In the case you mention there is a break of continuity at Nottingham, the Midland and the Great Northern companies do not run to the same station?—No they do not, at Nottingham the stations are not the same, but they are very near together.

12,826. But there is a break of continuity?—Yes.

12,827. (*Capt. Galton.*) Do not the trains run into one station?—No, they do not; and at Newark there is the whole length of the town to be traversed, one station is at the extreme east of Newark, and the Midland station is at the extreme north of it.

12,828. (*Chairman.*) Have you no complaints from the public that there is any delay in the interchange of traffic between your line and other lines of railway?—I do not recollect any. If there are complaints of that nature it is our business to meet them if it is at all practicable; but it would be hopeless to contend that all branch trains should be made to fit with the up and down trains it would be beyond possibility.

12,829. (*Mr. Hamilton.*) With reference to the case

S. Clarke, Esq.
22 Feb. 1866.

which you have just stated, you say that a passenger at Derby could not book through *viâ* Nottingham and Grantham to London ?—He cannot.

12,830. Irrespective of cost, why should he not be able to take a through ticket *viâ* Grantham to London ?—We should be very willing that he should do so, but the Midland Company would not like it to be done. There would be no gain to the public in booking a man by so very circuitous a route when there is a direct means of getting him to London.

12,831. Supposing it is a convenience for a gentleman living there, that he has friends in the neighbourhood, and he is willing to pay the local rates, why should he not be able to do so ? what difficulty would there be on the part of the railway company in his getting one ticket at Derby which should bring him all the way through to King's Cross ?—The only reason is that it would multiply to an enormous extent the stock of tickets kept at those stations, which amount to thousands and thousands, for the purpose of enabling a man once in twelvemonths to do this which would not save him any money. It would be multiplying the detail of the through booking arrangements to such an extent that it would become very cumbersome indeed; and if a man pays the same, what is the good ?

12,832. The good of it to him would be this, that instead of having to apply for two tickets he only has to apply for one ?—Then I would ask, what is there in that ?

12,833. (*Mr. Glyn.*) In fact it is no disinclination on the part of the company to serve the public as regards through booking, but it is the impossibility in a small station, or a common station, to have that multiplicity of detail carried out by one clerk ?—Yes, quite so.

12,834. (*Mr. Hamilton.*) Of course this increase to which you allude would ultimately lead to increased cost to the public, would it not ?—Yes, it would lead to increased cost to the public, certainly. When you asked about through booking, I thought you meant at the same rate, because if you only put it as high as to say that a man should be able to take a ticket at the sum of our local fares, I think that it would be a very useless waste of tickets, waste of stock, waste of trouble, and waste of details, because a man would gain nothing by it.

12,835. He gains nothing in money, but, for instance, there might be some members of a family going round that route, possibly all ladies, and they might wish to avoid having to go to the booking office to take fresh tickets ?—That is so completely an exceptional case that it would be very unwise to legislate for that one individual as compared with the hundreds of people who would go the other way.

12,836. It is not a question of legislation, but as to giving facilities on the part of the railway company ?—Another evil would be that there would have to be two fares from Derby to London in the Midland booking office. The fare is well known to the booking clerk, and a man coming to book to London would take a ticket from Derby to London for so many shillings; but if he has to book round by Grantham to go over the Midland line the railway fares are put together, and he has to pay two fares from Derby to London.

12,837. (*Mr. Glyn.*) Do you know the number of inter-bookings which now takes place through the system that now goes on of inter-booking ?—No ; but if I could tell you the number it would astonish you. The number of through rates are calculated by the million.

12,838. If the principle which has been alluded to were carried out still further the number would be so multiplied that in fact it would almost destroy the system ?—Yes.

12,839. (*Mr. Horsfall.*) I believe that you allow through booking to London from almost any station on your line ?—Yes, we have through-rates on every part of our own system from every station, not only to London but intermediately; all our branch stations can book to each other.

12,840. (*Capt. Galton.*) You afford many more facilities for through booking than the Midland Company do on their own line ?—Possibly ; but then theirs is a much more extended system, and their branches are more remote; ours is confined in a narrower space of country. I should think that very likely a branch at the Bristol end of their system would not have through-booking arrangements with a branch at the Leeds end.

12,841. Are you aware that they do not allow any small station on the Bristol and Birmingham section to book through to any station on the Birmingham and Derby section ?—I was not aware of that.

12,842. Nor do they allow them from the small stations on the Birmingham and Derby sections to book through Derby ?—I did not know that; I suppose that they find the interchange of traffic so minute that they want to decrease the number of tickets constantly in stock, and I have no doubt that the through rates in those cases would be made up of the sum of the two local rates; and therefore pecuniarily it would be no advantage to the public to be able to do so, except the small amount of convenience which the honourable member suggested.

12,843. (*Chairman.*) Have you any suggestions to offer to the Commission, with regard to the management of railways, by which you consider that the convenience of the public generally might be increased ?—No. My opinion is that the object of every company is to do its work in the best way that it can do it for the benefit of themselves and of the public at the same time, because the two things are identical, and that no pressure that can be put upon them by any Board of Trade regulations would have any beneficial effect in that direction.

12,844. (*Mr. Gower.*) Do you charge anything for passengers' luggage ?—We do when it is above a certain weight.

12,845. You are not in the habit of charging everything, are you ?—No, we are very liberal.

12,846. But is it not the common rule to charge ?—Our rule is to allow 112 lbs. to a first-class passenger, and 60 lbs. to a second-class passenger. Then we charge in respect of distance, and of course it is more to Scotland than it is to Grantham per lb. for anything in excess.

12,847. But you do not generally weigh the luggage to ascertain the weight ?—The rule is that if a passenger comes with a large number of boxes it is the business of a particular porter in the King's Cross booking office to weigh the luggage, and if there is a considerable excess to charge it; but if people are coming with a reasonable amount of luggage it goes as a matter of course, but we have power to charge it, and in many cases we do so.

12,848. (*Chairman.*) Do you run many excursion trains on your line ?—A great many in the autumn.

12,849. What is your opinion with regard to excursion traffic, are you favourable to it ?—I am favourable to it to a certain extent, but I am not sure that it has not gone too far.

12,850. (*Mr. Glyn.*) Do you mean too far as regards the safety of the public or too far as regards the profit of the company ?—Too far as regards the profit of the company, and of course, owing to the great weight of those excursion trains and the necessity sometimes of running two engines, the trains get so heavy that they are past control, and that is often a source of danger.

12,851. In point of fact if they are not upon a very large scale they scarcely are remunerative, I presume ?—It is the very low priced ones that I object to ; I think the facility of excursion trains taking people to the sea side in the autumn, or to any particular exhibition that is going on, or to races to which the public are desirous to go, is all very well. But those monster trains, as they are called, going out for a day's excursion, and carrying people at some wonderfully low price, and which can only be remunerative because of the numbers carried, I think, are a mistake.

12,852. Practically do you not find that those trains

interfere with your general traffic ?—No doubt if they became unwieldy they get in the way of everything.

12,853. (*Mr. Hamilton.*) Then why do you allow such trains to start ?—We do not. On the Great Northern line we do not allow trains to start of an uncontrollable length, because if they are too large we divide them and send them by two separate engines.

12,854. You are only putting the case now of your own railway, but where those immense trains are allowed you think them objectionable ?—Yes.

12,855. As endangering the safety of the public ?—Yes, I think so.

12,856. (*Mr. Glyn.*) Even as regards the profit to the company, you think that under the division which you have alluded to it is doubtful whether they answer ?—It is not all profit by any means, because people who are not excursionists go by those trains, they avail themselves of the cheap fares to transact any business for which they might have, and which, except for the excursion train, they would have paid the regular fare for.

12,857. (*Mr. Hamilton.*) Do you think that a second engine increases the insecurity of the train ?—I would much prefer running a train which was too heavy for one engine in duplicate rather than put two engines on one train.

12,858. But you do that sometimes, do you not ?—Very rarely.

12,859. (*Mr. Horsfall.*) On Saturday last did you not do it ?—Yes, we do it sometimes, but that is in cases where there has been no organization for doubling the train. The engine sometimes happens to get weak in some particular part of the journey, and another engine is put on to the train.

12,860. (*Mr. Glyn.*) The train might perhaps be unusually well loaded, and you might put on an extra engine in that case ?—Yes, the engine may be a little weak in itself, and then the pilot engine which is put on is not itself capable of carrying the train on, but the two together do it.

12,861. (*Chairman.*) Are your passenger fares by your ordinary trains very uniform throughout your whole system ?—Yes, and very nearly the maximum.

12,862. Have you ever tried any experiment as to the effect of lowering the fares between any particular towns ?—We had a great competition some 10 years ago with the Midland and other companies, and our fares got so low as 5*s.* from Yorkshire to London and back, and I have no doubt that an immense number of people availed themselves of them. But we have never reduced the fares some 10 or 20 per cent. for the purpose of experiment.

12,863. (*Mr. Glyn.*) That competition was between Manchester and London if I recollect rightly ?—Yes, and it extended itself to York.

12,864. Was not this the effect of that competition, that it interfered very much with all the regular Yorkshire traffic, and that it induced a great number of passengers to come through Manchester who otherwise would not have taken that route ?—Yes ; and the result of it was that the chairmen of the other companies who were affected by it tried to bring the companies to reason, and succeeded. Mr. Leeman, if you recollect, took a very strong part in it.

12,865. That would not be any example as to the effect of the reduction of rates, because in fact that reduction was so large that it was fed from every part of Yorkshire and every part of Lancashire, but if the reduction was general all over the country of course that stimulus would at once cease ?—Yes. That is met now by the excursion trains at considerable reductions during that part of the year when the tradesmen and mechanics can have leisure.

12,866. Do not you think that even that interferes with the regular traffic very often ?—I think it does, and that is what justifies me in saying that excursion trains are not all profit.

12,867. (*Mr. Horsfall.*) When the charge was only 5*s.* of course that was a rate which ensured loss to the companies ?—Such immense numbers of people came that they did not lose so much money as one might have thought would result, for, as the honourable member for Kendal says, we drew illegitimate traffic from other companies to those points where the rates were so low, and we did carry traffic which we were not justified in carrying.

12,868. (*Earl of Belmore.*) If the rates all through this district had been uniformly reduced of course you would not have had that traffic ?—No, it would have been a very considerable loss.

12,869. (*Mr. Gower.*) Was that the year of the Manchester Exhibition ?—Yes.

12,870. Do you not attribute the great increase of traffic partly to that as well as to the reduction ?—Of course that had an effect on it ; but that is not the only instance of very low fares that we had, because the system extended to Leeds and the West Riding generally ; but there is no doubt that they were far too low.

12,871. (*Earl of Belmore.*) In practice do you allow your passengers to carry more than the minimum amount of luggage which you are bound to carry for them by Act of Parliament ?—We profess not to do so, but we are not particular to a few pounds, or a box or two. There is really nothing that people are so reluctant to pay as for excess of luggage.

12,872. You do not fix a scale of luggage, but you are ready to allow them to carry a larger quantity than the minimum which your Act of Parliament allows ?—No ; 112 lbs. is what we allow for first class.

12,873. Some railway companies have a much lower minimum, have they not,—is not that the case with the lines going in the direction of Dover and the south of England ?—I think it must be based upon their Acts of Parliament. The public would have a remedy if the company would not allow them to carry to the full extent that the Act of Parliament regulates, but they are much more rigid in charging to the very pound on the South-eastern and the London, Chatham, and Dover lines, and that is partly because when they get on the French side of the channel the luggage is weighed very minutely, and as the English companies make a charge throughout, they have to pay over the proportion due to the French companies out of what they get from the public, and, therefore, if the French companies exact to the very pound, the English company having to pay for it has to exact it too.

12,874. The French companies base their own system of charges to passengers upon the assumption that they are paid for everything with the exception of a very small amount of luggage, do they not ?—It is much more rigidly done on the continent than with us, but one reason of that is, that there is only one line of railway, and no competition, and they can do as they please.

12,875. (*Mr. Gower.*) Would you be in favour of introducing into England the distinction with regard to goods traffic which exists abroad between quick and slow transit ?—No ; I think it would be a very undesirable thing, because the English lines are so crowded with traffic, and if we were to do as the French companies do with their *petite vitesse* and delay the trains actually and systematically, so that the public may not benefit by the quick transit, and thereby diminish the payment that they would make for the *grande vitesse*, that would just stop the traffic of England.

12,876. Would not there be a considerable saving in putting by all the goods till you had a full train always ?—In practice we do have full trains.

12,877. You have not often to send a half-loaded train ?—Very seldom. Of course on the branch lines the trains are much lighter, but then a lighter engine is used, but on the chief arteries of traffic, from York or from Manchester, the trains are full. Then we have a system of what we call pick-up trains, which do intermediate work, and any traffic between any number of stations intermediately is done by that train, and that train of course takes a very long time coming, not because it runs more slowly, but because it stops so often.

S. Clarke, Esq.
22 Feb. 1866.

12,878. (*Chairman.*) Have you any branch lines on which the traffic is so small that you run mixed trains of passengers and goods?—Yes; in Lincolnshire, where the country is very flat, and where, of course, the gradients do not arise, goods trucks are put on to most of the passenger trains.

12,879. Do you carry third-class passengers in general by most trains except express?—No, we do not; we confine the third class to two trains at the most.

12,880. Do you think that third-class passengers would increase in number materially if they had greater opportunities of travelling?—I think they would; but I think that it would be very likely to be to the detriment of the shareholders of the company, because people who now pay second-class fares would avail themselves of the third-class.

12,881. (*Mr. Glyn.*) Do you cultivate the third-class traffic much upon your branch lines?—We do not, except in Lincolnshire, where it is an agricultural population, who will not move unless they go very cheaply indeed, and have no real business to induce them to go.

12,882. (*Mr. Hamilton.*) Is it your reason for having so few third-class trains that you think it would diminish the number of second-class passengers?—Certainly.

12,883. (*Mr. Glyn.*) Have you market trains between the large towns in Lincolnshire?—In Lincolnshire, where the loop lines go through many small villages, the inhabitants of which have some interest in the Lincoln markets or the Boston markets, we do issue market tickets.

12,884. Do you find that it answers as a general rule?—Yes, it induces people to travel.

12,885. At a lower rate, or half fare?—Yes; and another reason which induced us to do so was, that the Witham is a navigable river parallel to the line of railway on which some little steamers used to run.

12,886. (*Mr. Hamilton.*) With regard to excursion traffic, I think I understood you to say that you doubted whether very cheap excursion traffic was profitable, and that you thought it was attended in many cases with danger?—Yes; I allude to the monster trains which are run in some parts of England.

12,887. Would you, therefore, think it desirable to interfere by enactment with excursion traffic?—No, I would not. I am adverse to an interference which places the responsibility not on the companies. I think when you get Government enactments applying in some cases, and companies acting for the best in others, because they are actuated by the desire of doing the best that they can for the shareholders, wherever you get that subdivision of interest you will get great difficulty.

12,888. You would not like any interference on the part of the Government to this effect, that trains should not be started except at certain intervals of time?—No. I would not indeed, because if it can be done with safety, I think it is desirable to do it, and if it cannot be done with safety, then practically the railway companies would not do it.

12,889. Do not you see that the judge of safety is the station master or the traffic manager at a particular spot?—And whom would you make the judge in the case that you have put?

12,890. I want to know whether certain regulations could not be laid down by Parliamentary enactment as to the intervals at which trains should follow each other?—It would be impossible to carry it out, in my way of thinking.

12,891. You will recollect the instance of the frightful accident in the Clifton tunnel, where it happened that trains started at an interval of only two or three minutes?—Yes, I recollect that.

12,892. Do you think it is better to leave this matter to the responsibility of the railway company?—I do, decidedly.

12,893. (*Chairman.*) Have you particularly any rules which compel a station master to detain a train if one is immediately before it?—Yes.

12,894. For a certain number of minutes?—Yes. No train is allowed to follow another except at an interval of five minutes. The danger signal is shown for five minutes, and then the caution signal is shown for five minutes more.

12,895. (*Earl of Belmore.*) With the view of obviating danger, would you always require an interval of five minutes between the starting of the trains?—Yes, at least, and then the telegraphing of the trains running is so very much more carried out than used to be the case, that it is very rarely that they can come within a certain distance of each other.

12,896. (*Mr. Hamilton.*) Have you a system of telegraphing from station to station?—We have, and we are going to extend it. We have just arranged with the telegraph company to put it up in the thronged district of Yorkshire, in the triangle between Wakefield, Leeds, and Halifax.

12,897. With what object are you extending it? Is it with a view to safety?—With a view to safety. They are bad gradients, through a wonderfully hilly country; and with a great deal of traffic, it is difficult to regulate the speed of trains so well as you can in a more level country, or where the gradients are easier.

12,898. Is the system of telegraphing from station to station usual on all the large lines?—It is on all the lines out of London for a certain length.

12,899. And that is the voluntary act of the railway companies themselves?—Yes, certainly, and done at a great expense to them.

12,900. I thought it was chiefly confined to the South-eastern railway?—No, it is done on the London and North-western railway completely now, and we do it near London, because the intervals are shorter, and have done it for years past. I do not know about the Great Western railway, but it applies to the Brighton line, I believe. I can speak for myself, and I can speak for the London and North-western railway.

12,901. Do you not recollect that at the time the evidence was taken after the Clifton tunnel accident, the manager of the Brighton railway said that he thought that the South-eastern system of telegraphing would lead to more accidents than it would prevent?—I do not recollect that. If that be so it is evident that they had not got it on their line.

12,902. (*Mr. Glyn.*) You find it practically advantageous, do you not, for the working of the traffic, as well as for the safety of the public?—Yes, I do.

12,903. (*Mr. Hamilton.*) Will you state what is your system of telegraphing?—We do not let one train leave the station next behind it until the train preceding it has left the station.

12,904. So that you know then that the intermediate line is positively clear?—Yes; but that can only be done where the stations are very close together, or by establishing intermediate signal stations, which in some cases we have had to do.

12,905. That was the reason why I thought it doubtful whether you had adopted it, because your stations are much further apart than they are on some other lines, such as the South-eastern line and the Brighton line. I was not aware that you had established those intermediate signal stations?—Yes, we have. It does not apply all over the line, but it applies to the district as far as Hitchin, which is 32 miles from London. After that the suburban traffic, as we call it, ceases, and the trains are less numerous. Telegraphic information is obtained, and no coal train is allowed to leave a station until the guard knows for certain where the passenger train is that he has to shunt for; and he regulates the distance that he runs in order to shunt by the knowledge that he possesses as to where the passenger train that is following him, and has to pass him, is.

12,906. How many signal stations have you between London and Hitchin; I mean signal stations distinct from traffic stations?—I think that there are only four; but then the stations near London are very thick. As far as Hatfield I think there are only four; I am not quite sure whether it is three or four.

12,907. (*Earl of Belmore.*) Was not it the intention

of the Great Northern Railway Company originally to lay down four lines of rails for some distance out of London ?—Yes, and we have land for that purpose. The tunnels are only made for two lines of rails, but some of the works are made for four ; but then we have adopted a plan lately of making duplicate lines passing through a district not then served—last year from Wood Green, up to which point from London the line has four rails upon it, we got a Bill for a railway to pass through Enfield and Hertford, so as to be carried eventually to Stevenage, which is just south of Hitchin, and thus forming a duplicate line.

12,908. So that you will be able to accommodate your local traffic without the regular trains running on the same line of rails as your through traffic, to a certain extent ?—Yes, and we serve a new country by that ; we put two new lines through a country hitherto destitute of railway.

12,909. Then it is a loop line, it is not putting lines alongside your existing rails ?—No, but it has the same effect ; because if we had too much heavy traffic to allow the passenger traffic to pass freely, then, by having two lines on which to subdivide the heavy traffic, or, if need were, to put all the heavy traffic on, the same effect would be obtained.

12,910. (*Chairman.*) Would you propose to run any passenger trains on that new loop line ?—Yes.

12,911. You are aware that it has been suggested in some quarters that great public advantage might be derived if the railways of the kingdom generally were purchased by the Government ; have you considered that question ?—Yes, I have.

12,912. Have you formed any opinion respecting what would be likely to be the result of such a system ? —I do not think that the railways would be so well managed, because there would not be that individual interest in each company to do its best ; and I think that if they were under the control of one general board, the ramifications of it would be so immense that the system would not be able to be carried out with the same amount of accuracy, and the same attention to the individual wants of the public, as is now the case where each company has to provide for the wants of the district that it goes through.

12,913. How do you think it would work if the Government possessed the railway and leased out each separate district to a company consisting of a certain number of individuals, say from 10 to 12 individuals, who would have to make their profit out of it ?—That would depend very much upon the regulations that were made. I do not know that any harm would come of it, but I do not see what would be the good of it.

12,914. Do you think that a certain number of individuals working a line for their own immediate profit would be likely to take a different view of the question as to what is fair and liberal, and what would be necessary, from that which a board of directors would take ?—I am quite sure that the result would be that they would grind the public in any place where they would have an opportunity of so doing, in order to obtain a large profit, because they must run considerable risk, and they would have to recoup themselves by getting the most they could out of the public.

12,915. (*Mr. Glyn.*) You would not find them making experiments in the way of reduction ?—No ; they would do their utmost naturally to get the greatest amount out of the public. They would neglect traffic that did not pay, and they would not provide additional plant ; they would do that which suited their pockets best.

12,916. And of course they would do the least they possibly could towards keeping up the line in its best condition ?—No ; they would not have the same desire, I should think, to do their work well ; their desire would be to make as much profit individually during the term of their lease as possible.

12,917. (*Earl of Belmore.*) Would not that answer apply generally to the case of the line of one company being leased by another company ; that the leasing company would not do so much for the development of the traffic of the leased line, as they would for the traffic of their own line ?—Not quite so, because the object of leasing a line is not only for the line itself, but because it brings traffic on to the parent line ; and if the thing as a whole is not properly worked, then of course a loss might arise from the lease which they had entered into. However, a line is not leased to be shut up, but generally to develop more traffic on to the parent line.

12,918. That is the principal object, and not the development of the traffic of the leased line, with the view of making as much as they can out of the locality ? —But you would not make traffic for the parent line unless the work were well developed on the branch line. If there is money to be earned, of course it has to be earned on the line that is leased, and by the company leasing the line.

12,919. Take a case of this sort : supposing a company were to lease a line at, and guarantee a minimum rent, but with the agreement that if the traffic should exceed a certain amount there should be a proportionate increase of that rent ; might it not so happen that it would be more to the interest of the leasing company not to develop the traffic beyond a certain extent, than to develop it fully, because if they did so develop it they would have to pay an increased rent ?—Yes ; that is quite possible.

12,920. Supposing the proposition which has been submitted by some of the witnesses, that various lines in Ireland should be leased to some of the great companies in England, were to be adopted, would not that case be very likely to arise ?—I did not know that it had ever been suggested that the English companies should lease the Irish railways. I thought the suggestion was that the Irish lines should be taken to by the Government, or that the Irish lines should be subdivided into two or three large districts.

12,921. And then leased by some of the large English companies ?—I was not aware of that.

12,922. Supposing that that were done, would not it possibly happen that it might not be to the interest of the company in England leasing those lines in Ireland to develop the traffic to the greatest extent ?—I think it would have the same effect as I suggested just now with respect to the leasing of lines by three or four individuals in England. If they were responsible for a certain amount of dividend, and they had to put the rest into their own coffers, of course they would do their best to develop the traffic which paid, and they would neglect that which did not pay.

12,923. (*Mr. Glyn.*) If they were leased in perpetuity, in fact, they would then become a part of the same system, and the companies leasing them would have every reason to develop the traffic as far as they could ?—They would, in fact, be the same as if they belonged to them if they were leased in perpetuity.

12,924. (*Chairman.*) Do you think it would be desirable that the terminal charges should be defined ?— I think that it would be a wise thing if the terminal charges applicable to through traffic could be defined.

12,925. (*Mr. Glyn.*) With regard to the interchange of traffic between companies, does anything particularly occur to you as necessary to be done in addition to what now voluntarily takes place between companies ? —If you mean whether it requires an enactment that it should be done, I should say no ; I think it is done to a very great extent now ; anywhere where there is advantage in making an exchange of through fares or through rates for passengers or goods it is done, and I think the desire of the companies to benefit themselves and the public at the same time (because the one does not benefit without the other) under the present system is a sufficient inducement.

12,926. You say passengers and goods ; of course you mean minerals, cattle, and everything else equally, do you not ?—Yes ; goods is the general term ; anything that is not passengers. "Passengers," of course, includes horses, carriages, and dogs, by general acceptation.

12,927. (*Chairman.*) Taking the whole expenditure of all the railway companies, is the average cost per mile travelled somewhere about 2*s.* 6*d.* per mile on

S. Clarke, Esq.
22 Feb. 1866.

all the railways in the country?—We reckon that it costs 2*s.* 6*d.* a mile.

12,928. Do you find it very uniform over all railways?—I think, as a well-known figure, you could not take a more generally accurate one.

12,929. (*Mr. Glyn.*) Do you find that the cost of your permanent way becomes rather heavier year by year?—We have got into a system of relaying a certain portion year by year, and therefore it is more costly, because the life of a rail, as it is generally put down, has expired.

12,930. I suppose that relaying has arisen from the necessity of doing so?—Yes, because the rails are worn out.

12,931. Then in fact the expenses are rather increased?—Yes; but I doubt whether we are not up to the full now, because we do endeavour to relay a certain number of miles per annum, and it would be a question whether we shall ever be in a better position than we are now, because the opening of new lines will not be so important an addition as to affect the general number of miles that must be relaid.

12,932. (*Mr. Hamilton.*) What is the average life of a rail on your system?—That is a difficult thing to say, because if the traffic is very heavy in the neighbourhood of a station where there is a great deal of shunting going on, of course it is very much shorter lived; but there are some rails on the loop line now which have been down 20 years, and they are good rails too, whereas some wear out in three years. Then there is a very important question now being discussed as to whether it is economy or not to employ steel rails.

12,933. Has that question been solved yet?—No, not yet; it is a question of cost.

12,934. (*Mr. Glyn.*) It has not been tested very generally, I believe?—No; we find that the cost of steel, as compared with that of iron, is as 13*l.* or 14*l.* to 8*l.* or 9*l.*

12,935. (*Mr. Hamilton,*) Have not the London and North-western Company laid down two steel rails in the very mouth of their traffic, in order to test their value?—Yes, and we have put in some half miles, and so on, to test the result as to the life of those rails; but there is a theory brought now that you may have a lighter rail if it is made of steel than of iron, and therefore economy may be effected by that means; but that is all idea at present.

12,936. (*Mr. Glyn.*) It is, in fact, merely an experiment at present?—Only an experiment.

12,937. (*Chairman.*) Do you see any prospect of there being any material reduction eventually made in the cost of working railways?—I do not believe it; I think that the speed, which is one great element of cost, will not be materially reduced. People have been used to have their goods and themselves carried so quickly that I do not think they would be satisfied at being carried at less speed, and that is one result of competition also.

12,938. (*Earl of Belmore.*) In fact the tendency would be rather towards increased speed, in consequence of improvements introduced into locomotives?—Yes; I should think that the result of the Government taking to the railways would be rather to decrease the facilities to the public than otherwise. There would be no object in the work being done better by one company than by another.

12,939. (*Chairman.*) Do you run a great number of carriages very partially loaded in passenger trains?—We do in some cases; I do not think very many; but, with a view to meeting the comfort of passengers, we run through carriages, because you cannot put it in any other way than comfort, for a man is carried just as well if he has to get out at the junction of a branch with the main line—he is carried to his destination just as well—but it is a great comfort, especially if there is a family of children or ladies going, that through carriages should be run; and I have no doubt the system at present adopted is to run more carriages than need be run.

12,940. Do you think that that materially adds to the cost?—Yes, it adds to the weight of the trains, and that is cost.

12,941. Has it ever been considered whether the weight of the carriages themselves could be reduced?—No; and the tendency is to increase the weight, because people want more head room and more elbow room also, and the carriages are made much larger than they used to be. All the newly constructed carriages, you will find, are on an improved scale.

12,942. So far as the framework of the carriages is concerned, could there be any reduction in the weight?—I think not. They are made of hard wood now, and that, of course, is the lightest material that can be used in proportion to bulk; and if there was not the strength which is now to be found in railway carriages I am afraid that in the event of an accident they would be smashed up much more easily.

12,943. Have you any knowledge of foreign railways?—Not except by travelling on the continent occasionally.

12,944. Do you know whether they are worked at about the same cost per mile as our lines?—I have no doubt that they are worked at less.

12,945. What are the elements that render them cheaper than ours?—Fewer trains, less wear and tear, and slower speed. On some of their lines, for instance, to Lyons or to Bordeaux, they run quickly enough one or two trains; but the general speed on the French or the Belgian railways is less than on the English railways.

12,946. (*Mr. Hamilton.*) Do you know any case abroad where they actually cover more than 30 miles an hour?—They go more than 30 miles an hour between Boulogne and Paris.

12,947. I mean where they cover more than 30 miles an hour; for instance, whether you would go 210 miles in less than seven hours?—I cannot enter into that question.

12,948. (*Earl of Belmore.*) You have had a system of communication between the guard and the driver in operation on the Great Northern for a long time, have you not?—Yes, between the guard and the driver, but not between the passengers and the guard.

12,949. Have you found the system answer between the guard and the driver?—It answers. On some occasions we have found it of service; but I cannot say that it is a very reliable thing, especially in a very long train. You are aware I dare say how it is done. There is a drum which carries a rope which takes up the slack, and when the slack is up then it pulls a cord tight and rings a bell. That slack is obliged to be wound round the drum, or else every time the train is started, when the draw springs naturally elongate, the bell would keep ringing, and the difficulty is when the train becomes of very great length.

12,950. There is a good deal of inconvenience, is there not, owing to that arrangement when detaching carriages at junctions?—The cord is proportioned to each carriage length, with a hook and eye, so that it is very easily detached. It has been in operation many years now, and good has resulted from it, and we have tried to make the same thing apply to general communication from passengers to the guard, but it will not answer.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Friday, 23rd February 1866.

PRESENT :

The Right Hon. the Earl of Belmore.
The Right Hon. Lord Stanley, M.P., F.R.S.
The Hon. E. F. Leveson Gower, M.P.
Sir Rowland Hill, K.C.B., F.R.S.
Capt. Douglas Galton, R.E., C.B., F.R.S.
Geo. Carr Glyn, Esq., M.P.
William Pole, F.R.S., *Secretary.*

His Grace THE DUKE OF DEVONSHIRE, K.G., F.R.S, in the Chair.

James Smithells, Esq., examined.

J. Smithells, Esq.
23 Feb. 1866.

12,951. (*Chairman.*) You are traffic manager of the Lancashire and Yorkshire Railway ?—Yes.

12,952. Have you had an opportunity of looking at the evidence given before this Commission by gentlemen from Liverpool and other places ?—I have.

12,953. Have you observed some complaints by the Liverpool gentlemen as to the inequality of your charges from Liverpool as compared with other places ?—Yes.

12,954. Will you be so good as to make any observations you may think proper on that evidence ?—I have carefully read over the complaints to which your Grace refers, and this is my answer: Upon this complaint which pervades the evidence of these witnesses and which appears to be their principal grievance, I state that the Lancashire and Yorkshire Railway Company have spent upwards of two millions of money in providing stations and lines in the borough of Liverpool, and are deeply interested in the prosperity of that port; they have always been and still are anxious to develop the traffic of Liverpool, but they feel bound also to consider the claims of other ports and places upon their own line, and upon the lines of other companies with whom they have through rates and interchange traffic. The Lancashire and Yorkshire Railway passes through one of the most populous districts in the kingdom, and accommodates a large number of important towns, some of which are also accommodated by other companies, but many of which are dependent upon the Lancashire and Yorkshire Railway Company alone. The companies whose lines are connected with the east coast ports of Newcastle, Hartlepool, Hull, and Grimsby, are naturally anxious to develop the traffic of those ports, and they ask us to join them in through rates and we assent, because we consider it would not be just either to them or to the public if we refused to establish such through rates as would enable the population on our own line to obtain their supplies from those ports as well as from Liverpool and other ports on our own line. This, however, can only be accomplished by our accepting upon traffic from the more distant ports a less rate per ton per mile than we charge from less distant ports upon our own line to the places of consumption, and such traffic is of course correspondingly less profitable to the company than the traffic conveyed by us from ports less distant. But by adopting this principle we undoubtedly confer great benefit upon the population of our district by enabling them to draw their supplies from a larger area of country and more numerous markets than they could possibly have access to if the uniform mileage principle was adopted. A uniform mileage charge, whether based upon the lowest or the highest rate now in operation, would have the effect of excluding the traffic from east coast ports and from other distant ports and places, and would in fact give the port of Liverpool and other west coast ports which are nearer to the places of consumption a monopoly of the traffic.

According to Appendix H of the evidence, the various Chambers of Commerce and other public bodies in the United Kingdom have been invited to lay before the Commission any complaints or suggestions they have to make with respect to railway companies, but it does not appear in the evidence which has been given before the Commission that any of the corporations, chambers of commerce, or tradesmen's associations connected with the towns on the Lancashire and Yorkshire Railway have given any evidence to show that the rates from Liverpool are excessive, or that the principle which we adopt of admitting the produce of other ports into our district at low rates per ton per mile than from Liverpool, has been prejudicial to the interests of those towns. In fact it appears that Rochdale is the only town upon our line from which any complaints have been made to the Commission, and to those complaints, very few of which apply to Liverpool, I am prepared to submit such explanations as will, I trust, satisfy the Commission that the Lancashire and Yorkshire Railway Company have not been unmindful of the wishes and interests of the inhabitants of Rochdale.

I will now refer to the answer to question 38 as to the "want of accommodation in Liverpool." The Lancashire and Yorkshire Railway Company have provided the following accommodation in Liverpool and at the cost which will be shown in the following Table,—

	Area in Statute Acres.	Cost.
Exchange Station, for passengers	...	£240,000
Great Howard Street, for goods -	11	300,000
North Docks, for ditto - -	25	350,000
Sandhill Docks, for ditto - -	24	140,000
Timber Depôt, North Docks -	4	20,000
Bootle Station, for goods - -	18	...
	82	£1,050,000

Of these 82 acres about 40 are not actually in use, but are available for the increasing requirements of the traffic. The 18 acres at Bootle are now being appropriated for a new station for timber and other traffic from the docks at the north end of Liverpool, and we are constructing a short branch from that station to connect it with our main line, as will be seen by the plan I now produce (*handing in the same*). They have also provided upwards of ten miles of sidings in Liverpool. It is true that occasionally the traffic of Liverpool is so excessive as to cause us very great difficulty in despatching it as rapidly as it is presented to us, but the railway company is not alone to blame for this. The carters in Liverpool, over whom we have no control, for their own convenience tender the bulk of the traffic to us in an afternoon and evening instead of presenting it regularly throughout the day. The following table shows how the traffic is generally delivered to us :—

From	6 a.m.	to	9 a.m.	5 per cent.	of the day's traffic.
„	9 „	to	12 noon	20	„ „
„	12 noon	to	3 p.m.	15	„ „
„	3 p.m.	to	5 „	20	„ „
„	5 „	to	7 „	40	„ „
				100	

Thus 40 per cent. is delivered to us in the nine hours up to 3 p.m., and 60 per cent. in the four hours up to 7 p.m. This practice, combined with a fluctuating market, such as that for cotton, of which on one day 3,000 bales only may be sold, and on another as many as 20,000 bales, no doubt occasionally causes the public and ourselves inconvenience. To meet these fluctuations in traffic the company have to incur special expense, by employing extra labour and running special trains; but, regardless of such expense, they do all they can to accommodate the public under such

J. Smithells, Esq.

23 Feb. 1866.

circumstances. To increase the station accommodation of the company in Liverpool so as to meet an occasional extraordinary influx of traffic consequent upon an excited state of the cotton market, would, in my opinion, be an unnecessary expenditure of the capital of the company, which the public cannot reasonably expect us to incur; nevertheless, in anticipation of an increasing trade and our future wants, the directors have for some time past had under consideration plans for important improvements at Great Howard Street and North Docks Goods Station, and the company undoubtedly have at their command unappropriated space for station accommodation in Liverpool sufficient for the traffic of the Lancashire and Yorkshire railway for many years to come.

I will now refer to what has been stated in answer to question 109, as to "Terminal expenses in Liverpool." The cost to the company in Liverpool is more than at other stations on the line from the fact that the wages of the porters and the general staff are higher; for instance, porters in Liverpool receive from 21*s.* to 26*s.* per week, whereas at other places they receive from 17*s.* to 20*s.* per week. The cost of working the traffic at each station upon the railway depends upon local circumstances, such as the rate of wages, the cost of accommodation, and the character of the traffic, scarcely two stations costing precisely the same amount per ton; at stations in an agricultural district, for instance, porters are paid from 16*s.* to 18*s.* per week, whereas the same class of men in Liverpool are paid from 21*s.* to 26*s.* per week. The witnesses are also in error in supposing that a terminal charge of 1*s.* at each station is sufficient to cover the cost incurred by the company, the fact being that for wages, shunting expenses, stores, gas, &c., the cost in Liverpool alone is above 2*s.* per ton.

The next point I will refer to in the answers to questions 117 to 124 is the "cost of carting in Liverpool." The Lancashire and Yorkshire Company contract for their carting in Liverpool, and pay for general goods 1*s.* 3*d.* per ton, and 1*s.* per ton for grain. These rates are considerably below the charge for cartage established and authorized by the Corporation of Liverpool. We made the best arrangement we could for this service, and should be glad to contract with Mr. Clark or any other responsible person, prepared to discharge the duty to our satisfaction, at 10*d.* a ton, the price at which Mr. Clark states it can be done at a profit.

The answer to question 192 is as to "Rates between Dunkirk and Liverpool and Manchester," and my answer to that is this: the Lancashire and Yorkshire Railway Company are not parties to the through rates referred to; the only interest they and other railway companies have in the traffic is between the ports on the east coasts and Liverpool or Manchester; these rates being mutually arranged by the railway companies, and charged to the public without any reduction, rebate, or allowance whatsoever in favour of any particular individual. If through rates such as those referred to by the witness have at any time been in operation, they have been established between the steampacket companies and the public, without the knowledge or consent of the railway companies. I will hand in tables showing in what particulars the statements made by Mr. Clark, Mr. Patterson, and Mr. Halhead are incorrect. I could have amplified my answer to the complaints made by stating what our traffic is, and I could have given other statistical information, but I did not think it necessary to do so.

12,955. (*Lord Stanley.*) With reference to the inequality of charges you put it in this way, that the complaint from Liverpool is not that the Liverpool rates are excessive in themselves, but that other rates are low?—Just so, and I believe that is the fact. It is not because the rates are excessive, or beyond the powers which Parliament has given us to charge, but it is because those rates appear to the Liverpool traders to be higher than the Hull and Hartlepool rates.

12,956. You say that the Liverpool people would be quite satisfied if their own rates remained as they are, provided the rates on the other parts of the line were higher?—No doubt. If we gave the Hull trader the same rate per ton per mile as the Liverpool trader, no doubt the Liverpool trader would be quite satisfied.

12,957. Your defence is, that, as a commercial undertaking, your company has a right to charge any rates that it may consider most remunerative within your parliamentary maximum?—If the maximum of good which railways are calculated to afford to the public is to be enjoyed by the public, it can only be by our adapting the charges to the traffic and the circumstances of it. With respect to the accommodation in Liverpool I should like to explain to the Commission a map which I will hand in, showing the accommodation we have provided there, as the Liverpool traders appear to have complained that we have not provided the accommodation which they desire. The red lines on the map indicate the Lancashire and Yorkshire railways and its stations, the green lines indicate the North-western, and the yellow one the Sheffield Company's new line (*explaining the map to the Commission*). We gave 200,000*l.* for the land for the site of the North Docks station in Liverpool. At that time it was comparatively waste ground, having rubbish upon it, and no warehouses or buildings. It is now surrounded with warehouses and ironworks, and docks have extended very rapidly in this direction (*pointing to the map*).

12,958. (*Sir R. Hill.*) When was that land bought?—Ten years and more ago.

12,959. Have you any idea of the value of the neighbouring land now?—It is very valuable.

12,960. Is it more valuable in proportion?—No doubt of it.

12,961. (*Chairman.*) You say that you have adopted the through rates from the eastern coast to enable the public to obtain their supplies from those ports as well as from Liverpool and other ports on your own line, but do you mean to say that you would adopt that principle even if it were detrimental to the interests of your company?—I think it is to a certain extent detrimental to our interests, and if we took a selfish view of it, we should not accept the low rates that we do now.

12,962. You are not actuated solely by the desire of obtaining the most profitable rates for your company?—No; if we were, we should not accept the low rates that we do from the east coast. We are called upon by the North-eastern Company who exchange their traffic with us, not only from Hull and Hartlepool, but from their general system to make low rates to Hull and Hartlepool, to develop the traffic of those ports.

12,963. I presume you consider, on the whole, that it is best for the permanent interests of your company to adopt the principle of encouraging traffic from other ports?—Yes; and if we do not the public have a remedy by making new lines, but we think it better, taking a broad view of the matter, to encourage the traffic from other ports, as well as from those on our own system.

12,964. (*Sir R. Hill.*) Is that done with a view to the public advantage or the advantage of the railway company?—I think more with a view to the public advantage than to the advantage of the railway company, and I think it must necessarily be so.

12,965. It is not to the disadvantage of the company?—Eventually I think it will not be, because I think the more useful we make our railway the more profitable it will be in the end; and we prevent the making of new lines by utilizing to the utmost that which exists. The Commission will, I think, see that the rates we charge from Hull as against the rates charged from Liverpool, are not in themselves lower. It is only the rate per ton per mile which the Liverpool people complain of. The rate for timber from Liverpool to Ashton is 10*s.* per ton, whereas the rate from Hull is 12*s.* 6*d.* per ton, and it is the total amount of

the rate which the public look at, not the rate per ton per mile.

12,966. Upon which transaction would the company obtain the least profit, in conveying at the lower rate for a long distance or at the higher rate for a short distance?—Undoubtedly it would be more profitable to the company to convey traffic the shorter route; the Liverpool traffic.

12,967. Do you receive upon the whole less?—Yes, for the Liverpool traffic conveyed a shorter distance, but relatively a higher mileage rate which is more profitable than the Hull traffic conveyed a longer distance at a less mileage rate.

12,968. (*Earl of Belmore.*) You share the profit with the North-eastern Company?—Yes, we divide it by our mileage. Our line joins the North-eastern line at Normanton, and we divide the profit according to the mileage.

12,969. Have you a longer mileage when you convey the traffic from the North-eastern system where you join it to any place or from Liverpool to different places as a rule?—We have a long mileage when goods are conveyed by the North-eastern, but still the rate per ton per mile is so much less as not to amount in the aggregate to the same sum as we get out of the Liverpool traffic.

12,970. (*Sir R. Hill.*) May not the Liverpool people justly complain that they are made to pay a higher rate than from the more distant ports, and that their paying that higher rate assists you to carry from the more distant ports at a lower rate?—No; the rate we charge from the more distant ports is not lower than the Liverpool rate. From Liverpool to Ashton the rate for timber is 10*s.* a ton, and the rate from Hull is 12*s.* 6*d.* a ton, so that in reality the rate itself from Hull is larger than the Liverpool rate.

12,971. But the rate per mile is less?—Yes.

12,972. I understand you to say that the profit to the company was less?—Yes.

12,973. Does it not amount to this, that the loss you incur in carrying from Hull has to be made up by the increased charge upon that which you carry from Liverpool?—No doubt of it; we get more profit, and in that way it is made up, but then the rate we charge is within the powers granted to us by the Act of Parliament.

12,974. That is your justification?—Certainly. Railways, as commercial undertakings, should be adapted to the requirements of the commerce of the district, and we say and believe that we do great good in admitting the produce of Hull and other ports to our population consisting of between 2,000,000 and 3,000, 000 rather than confining it to the Liverpool market.

12,975. (*Chairman.*) In fixing these low rates from the eastern ports, are you influenced by the consideration that it is of importance to your Company in parliamentary conflicts to show that you have consulted the public interests as well as your own more immediate interests?—Yes; we act upon that principle. We make through rates with all companies by the usual routes, in order that there may be no complaints made against us when we appear in Parliament. We book through from our stations to London by the North-western, the Great Northern, the Manchester, Sheffield and Lincolnshire, and the Midland Companies, and a passenger from Blackburn can go and demand a ticket by any of those routes at the same fare. We do this in order to place ourselves in a sound position before Parliament, and to show that we have not abused the powers which Parliament has conferred upon us. I may state, before leaving the Liverpool evidence, that the general traffic of the company in goods, coal, coke, timber, &c., in 1858 was 760.000 tons, and in the year 1864 1,049,000 tons, showing that the trade has gradually increased. We have a very large traffic in cotton and in other articles, and they are constantly on the increase.

12,976. Is there a very large traffic from the eastern ports over your line?—Yes, a considerable traffic. The Humber traffic, I suppose, represents about 180,000*l.* a year, that is, the gross receipts.

12,977. And from Newcastle and ports in that neighbourhood?—Yes.

12,978. Is that an increasing traffic?—Yes.

12,979. Is it increasing in a greater ratio than the traffic to Liverpool?—I do not think it is. I do not think there is very much difference between the two.

12,980. The Saltaire case appears to differ from the Liverpool case. You deny the truth of the statement made by Mr. Stead?—Yes; he is labouring under a misapprehension altogether.

12,981. Have you ever obstructed the traffic between Saltaire and Manchester or Liverpool by the Colne route?—We have no interest or desire to obstruct the traffic between Manchester and Saltaire when conveyed by the Colne route. This charge against the Lancashire and Yorkshire Company is inconsistent with the facts, and neither Mr. Stead nor the Midland Railway Company have made such a complaint to the Directors or officers of the Lancashire and Yorkshire Company. The only correspondence I find on the subject is in June 1865, in reference to two small packages, one of which we never received, the other being in Messrs. Salt and Son's possession at the time they wrote to us, stating that they had not received it, and they subsequently apologized for having given us unnecessary trouble. According to Mr. Stead's showing, by questions 490, 497, 507, 580, his complaints, if made, have been addressed to the Midland Company, and not to the Lancashire and Yorkshire, but the Midland Company have not communicated any such complaints to us. The Midland Company have for some time past had an arrangement with the Manchester, Sheffield, and Lincolnshire Company for a general interchange of traffic by the Sheffield route, which may probably account for this diversion. Neither the Midland Company nor Mr. Stead have any ground of complaint against the Lancashire and Yorkshire Company for obstructing traffic by the Colne route, the fact being that the service of goods trains is now, and has been since the amalgamation of the Lancashire and Yorkshire and East Lancashire Companies, in 1859, as perfect in every respect as it was before the amalgamation, and the servants of the amalgamated Company at Liverpool, Manchester, and other places, have had no instructions since the amalgamation to depart in any respect from the practice they previously adopted. When the Amalgamation Act was passed, the Midland Company, as a condition to their assenting to it, and for the protection of the Colne route, required us to enter into an agreement giving them running powers to Liverpool and Manchester from Colne, and that agreement is embodied in the Amalgamation Act, but they have never had occasion to exercise those powers, we having forwarded traffic by that route with the same expedition since the amalgamation as we did previously. Mr. Stead appears to have overlooked the fact that the Midland Company possessed these running powers, which they could have exercised in his interest and their own in case we had not worked the traffic satisfactorily.

The statement made in answer to questions 563 and 564 is altogether inconsistent with the facts. The Lancashire and Yorkshire Company never instructed their carters to refuse traffic for Saltaire by the Colne route, nor have our agents at our stations done so. I have caused particular inquiry to be made from them, and they distinctly deny having at any time refused traffic as alleged by Mr. Stead.

In reply to the answer to question 506, I beg to state that the Lancashire and Yorkshire Company are actuated by no such motive, nor have they ever contemplated forwarding the traffic by that route, had it been their interest to do so, but it is in fact more profitable to them to forward it *viâ* Colne than *viâ* Bradford.

With reference to the answers to questions 491, 492, 515, 520, and 580, I may state that we have daily, between Manchester and Liverpool and Colne, the following goods trains, by which it is our interest to forward as much traffic as possible to Saltaire.

J. Smithells, Esq.

23 Feb. 1866.

These trains are run daily for the special purpose of forming connexions with the Midland trains at Colne, as they did previous to the amalgamation.

Liverpool, departure 1.40 p.m. ... 9.30 p.m.	Colne, departure 3.15 a.m. ... 7.5 a.m.
Colne, arrival 7.0 p.m. ... 1.15 p.m.	Liverpool, arrival 6.0 a.m. ... 12.10 p.m.
Manchester, departure 1.40 p.m. ... 7.0 p.m.	Colne, departure 11.30 p.m. ... 3.45 a.m.
Colne, arrival 10.30 p.m. ... 1.45 a.m.	Manchester, arrival 3.0 a.m. ... 6.15 a.m.

Mr. Stead's answer to question 581 proves that he is in error in supposing that it is our desire or our interest to obstruct the traffic *viâ* Colne, as the same motive which he supposes prompts us to obstruct Manchester traffic would also prompt us to obstruct Liverpool traffic. By an agreement made between the Lancashire and Yorkshire and the Midland Companies, in 1861, it is provided that traffic shall be exchanged between the two companies by the junctions at Colne, Oakenshaw, Leeds, and Normanton, being all the junctions between the two systems of railway. To show that the Colne route has not been closed or obstructed, I submit the following statement of traffic exchanged with the Midland Company, by that route, for the years 1858 and 1865.

	Goods.	Minerals.
	Tons.	Tons.
Year 1858 - - - -	33,592	919
Year 1865 - - - -	48,149	2,154
Increase, year 1865 - -	14,557	1,235
Equal to increase of - -	43 per cent.	134 per cent.

This statement includes the traffic of Liverpool and Manchester with Leeds and Bradford, and intermediate stations upon the Midland railway up to Colne.

12,982. I think I understood you to say that the traffic in goods between Saltaire and Manchester or Liverpool by the Colne route has increased 43 per cent. in seven years ?—Yes ; from 1858 to 1865. We have every desire to increase the traffic by that route, and we are under an obligation to the Midland Company to carry traffic ; in addition to that they have running powers over our line to Liverpool and Manchester, but they have made an arrangement with the Sheffield Company which has led to a diversion of that traffic.

12,983. Have you read the evidence of Mr. Atkinson and Mr. West of Hull?—Yes.

12,984. Are you prepared with an answer to their complaints?—Yes. The answers given to questions 891, 923, 924, and 925, refer to the " Humber agree- " ment." Now the Humber agreement provides for a division of the traffic between Hull, New Holland, and Grimsby, with Liverpool, Manchester, Ashton, and Staleybridge. The North-eastern, London and North-western, Manchester, Sheffield, and Lincolnshire, and Lancashire and Yorkshire Railway Companies are the parties to that agreement. The rates at which the traffic is carried are mutually arranged between the companies from time to time, so as efficiently to develop the Continental traffic with Liverpool and Manchester, *viâ* Hull and Grimsby, as against the sea route. This agreement is not adverse to the interest of the port of Hull.

The answers to questions 918, 926, and 927 relate to " the Lancashire and Yorkshire Company's interest " in the traffic of Hull and Hartlepool respectively," and I beg to state that the Lancashire and Yorkshire Company receive a less net amount per ton per mile, upon traffic between Hull and Manchester, than upon traffic between Hartlepool and Manchester, the Hull and Manchester traffic being divided with other companies under the Humber agreement, the Hartlepool traffic not being so divided. To stations on the Lancashire and Yorkshire line not included in the Humber agreement, for instance, Todmorden, the Lancashire and Yorkshire Company have a larger profit per ton per mile upon the Hull traffic than they have upon the Hartlepool traffic when carried at the same rate, because in both cases they retain the whole of the mileage receipts between Normanton and Todmorden, and in consequence of the distance from Hartlepool being 36 miles more than from Hull, the receipt per ton per mile is less upon the Hartlepool traffic than upon that from Hull.

With reference to the " inequality of charges," which are complained of in the answer to questions 986, 993, and 994, I have to say that the rates generally between Hull and Hartlepool and Lancashire and Yorkshire towns are the same. If the Hartlepool rates were higher than those of Hull, the effect would be to shut out the traffic of Hartlepool from the Lancashire and Yorkshire district. The ports of Hull and Hartlepool stand in relation to the North-eastern Company as the ports of Liverpool and Fleetwood stand in relation to the Lancashire and Yorkshire Company ; for the purpose of developing the traffic of Hartlepool the North-eastern Company quote the Hull rates to the towns on our line, although the distance from Hartlepool is considerably more than from Hull, and we accept from them a mileage proportion of the receipts upon their traffic, whether carried from Hull or Hartlepool, to stations on our line. A large traffic in addition to that of Hull and Hartlepool is exchanged between the Lancashire and Yorkshire and the North-eastern Railway Companies. The conveyance of traffic at reasonable through rates over the lines of the two companies is, undoubtedly, a great advantage to the public, who thereby obtain access to all the ports and places upon the two systems of railway from which to draw their supplies, whereas, by adopting the uniform mileage principle, the traffic of Hartlepool would be altogether excluded from the Lancashire and Yorkshire Railway, and that of Hull would also be excluded from most of the places upon our line by that of Liverpool. The present practice of the Lancashire and Yorkshire and North-eastern Companies has the effect of developing the trade of the ports on the Humber and other East Coast ports, but the principle of equal mileage rates, which I understand the witnesses to suggest, would greatly injure some portions of that trade, and destroy other portions. The complaints made against us are not serious, and they are rather addressed to the North-eastern Company, but to the extent that they are made against us, I have, I think, answered them. I am quite sure that the gentlemen from Hull have no occasion to blame the Lancashire and Yorkshire Company, for they have done all they could to develop the traffic of their port. It is the complaint of the merchants in Liverpool that we have done too much for the Hull people.

12,985. Liverpool complains of Hull, but Hull complains of Hartlepool and of the Tyne Docks being favoured ?—Yes, and they have appeared before Parliament frequently on that question, and if their view was carried out Hartlepool would be closed against us. I am sure that the public interest is promoted by the arrangements that we have made with the other companies in respect to the traffic of the Humber.

12,986. I understand that since the evidence was given from Rochdale you have met their views substantially with respect to the goods traffic ?—We met them before the evidence was given.

12,987. But they are still dissatisfied with the scale of fares for passengers between Rochdale and Manchester ?—Yes. The evidence given in answer to questions 1288 to 1452 by Mr. Blackburn, Mr. Fletcher, and Mr. Lawton, refers to complaints, some of which were first made to the Lancashire and Yorkshire Company by the Tradesmen's Association of Rochdale in January 1865, and the remainder on the 13th May 1865. Some of the complaints made in January appeared reasonable, and were remedied by the directors before the 1st March 1865, others were proved

to be unfounded, and one demand, which was for a reduction in fares between Rochdale and Manchester, the directors considered unreasonable. The remaining complaints made in January the directors could not dispose of without the assent of other companies, and they are now under consideration. The complaints communicated to us on the 13th May 1865, were unfounded. In proof of the foregoing statement I submit the following evidence:—

On the 3rd January 1865, Mr. Fletcher, by letter addressed to our Secretary, asked for an interview between a deputation of the Tradesmen's Association of Rochdale and the directors of the Lancashire and Yorkshire Railway Company. A meeting was accordingly arranged for the 11th January, when a deputation, consisting of Mr. Blackburn, Mr. Fletcher, Mr. Lawton, and other gentlemen, attended and presented a memorial and a resolution of the Rochdale Tradesmen's Association, of which the following are copies:

"RAILWAY ACCOMMODATION.

"To the Board of Directors of the Lancashire and Yorkshire Railway.

"We, the undersigned tradesmen and other inhabitants of Rochdale, are decidedly of opinion that the town is entitled to more and better railway accommodation, and approve the efforts made by the Tradesmen's Association to effect this object."

This was signed.

"RESOLUTION passed at a Meeting of the Rochdale Tradesmen's Association held on 13th day of December 1864.

"Resolved, that a deputation be sent to the authorities of the Lancashire and Yorkshire Railway Company, and state to them their complaint as to fares and rates of carriage, and number of trains.

"Resolved, that there be such a deputation, but previous thereto a committee to get up facts and information to represent to the directors, and that the following be a committee, viz.:—Mr. Thomas Ashworth, Mr. Rogers, Mr. Blackburn, Mr. Lawton, Mr. Robert Shepherd, Mr. Challinor, together with the officers.

"The committee of the Association ask the following concessions, viz.:—

"A greater equality in rates for the carriage of goods.

"A greater number of trains up to and from Manchester.

"A reduction in the fares equal with other neighbouring towns, and think that the following prices ought to be available with every train,—

2*s.* First class
1*s.* 6*d.* Second " } Return Manchester.
1*s.* Third "

"Mem.—Trains to stop at Littleborough in the forenoon. The dealers in grain are charged 2*s.* 6*d.* a ton more than the millers.

"Mem.—Third class to Bury and Bolton. The same will apply to the trains to Yorkshire.

(Signed) "JAMES FLETCHER, Secretary."

The deputation having explained generally the wishes of the tradesmen of Rochdale, the Directors promised carefully to consider the several suggestions which had been made to them. And, subsequently, the following correspondence passed between the Association and the railway company:

"RAILWAY ACCOMMODATION FOR ROCHDALE.

"Rochdale Tradesmen's Association,
"SIR, "Rochdale, February 7, 1865.

"As we have a general meeting of the Association on Thursday next, the committee would be glad to be advised whether the directors of your company have come to any decision with respect to railway fares, rates of carriage, &c., as urged by the deputation from this association, on 11th January last. The committee are in hopes that, seeing it is a board meeting to-morrow, they may have something definite to lay before the general meeting of Thursday.

"I am &c.,
(Signed) "JAMES FLETCHER."
"W. S. Lawn, Esq."

"Lancashire and Yorkshire Railway,
"SIR, "Manchester, February 8, 1865.

"I HAVE your favour of the 7th instant, and you will please to inform the association that the Board have ordered their officers to prepare for the 1st proximo several changes in the working of passenger traffic between Rochdale and Manchester, and to rectify discrepancies which appear to have crept in amongst the goods charges.

"I am, &c.
(Signed) "WILLIAM S. LAWN, Secretary."
"James Fletcher, Esq.,
"Rochdale Tradesmen's Association."

"Lancashire and Yorkshire Railway,
"SIR, "Manchester, February 10, 1865.

"I BEG to inform you that the directors of the company, having fully considered the various complaints laid before them by the deputation from the Rochdale Tradesmen's Association, have ordered certain alterations to be made on 1st March proximo, which they trust will meet the views of the deputation, and conduce to increased public convenience.

"I am, &c.
(Signed) "WILLIAM S. LAWN,
"James Fletcher, Esq., Rochdale." Secretary."

ROCHDALE TRADESMEN'S ASSOCIATION,
SIR, "Rochdale, February 11, 1865.

"ON the other half I beg to hand you a copy resolution passed at a special general meeting of our Association on the 9th instant.

"I am, &c.
(Signed "JAMES FLETCHER, Secretary."
"W. S. Lawn, Esq.,
"Lancashire and Yorkshire Railway."

ROCHDALE TRADESMEN'S ASSOCIATION, Special General Meeting, February 9, 1865.

"(Copy of Resolution passed.)

"RESOLVED,

"THAT the best thanks of the Association be conveyed to the directors of the Lancashire and Yorkshire Railway Company, for the courteous manner in which they received the deputation from this Society on the question of railway accommodation on the 11th ultimo, and also for the courteous and encouraging letter received to day from the secretary to the Board of Directors."

"THE ROCHDALE TRADESMEN'S ASSOCIATION,

"SIR, "Rochdale, February 13, 1865.

"Railway accommodation for Rochdale.

"Referring to your favour of the 8th and 10th instant, the committee desire me to say that perhaps you will oblige the Association with a list of the alterations to be made in the charges for carriage of goods, in order to compare with the statements which have been brought to the notice of the Association. Without this the committee will be unable for some time to know definitely what concessions have been made. In the passenger traffic the charges will be at once apparent. I beg to hand you further anomalies in charges.

"I am, &c.
(Signed) "JAMES FLETCHER,
"W. S. Lawn, Esq. Secretary."

"ROCHDALE TRADESMEN'S ASSOCIATION.

"Statements made as to carriage of goods.

"Market Harbro' to Rochdale... Old boilers 30*s.* per ton.
" " Manchester " 13*s.* 4*d.* "

and afterwards

"Re-booking to Rochdale ... Old boilers 3*s.* 4*d.* per ton, saving 13*s.* 4*d.* per ton.

"Hull to Rochdale ... Old metal 4*s.* a ton more than to Oldham.

"Blackburton station ... ... } Old machinery 8*s.* a ton
Westmoreland to Rochdale } more than to Oldham.

"Chirk, in Wales, to Rochdale ... Old metal 17*s.* per ton.
" " Manchester " 10*s.* 6*d.* "

and afterwards

"Re-booked to Rochdale ... Old metal 3*s.* 4*d.* per ton, thereby saving 3*s.* 2*d.* per ton.

The consequence is, the metal is sold in Manchester, and 6*s.* 6*d.* per ton saved.

"Liverpool to Rochdale ... Cotton 12*s.* 6*d.* per ton.
" Oldham ... " 10*s.* 10*d.* "
" Heywood ... " 10*s.* "

"Liverpool to Rochdale ... } Flour ... 11*s.* 4*d.* per ton.
" Littleboro' ... } For sizing 9*s.* 10*d.* "
" Todmorden } Warps ... 9*s.* 10*d.* "

J. Smithells, Esq.

23 Feb. 1866.

" Haslingden to Rochdale 15 miles	Heavy machinery	10*s.* per ton.
" Ditto to Manchester 18 miles	„	6*s.* 4*d.* „
" Ditto to Oldham near 22 miles	„	8*s.* 4*d.* „

" Rochdale to Stroud 12*s.* per ton more than from Oldham.

" Rochdale to Liverpool 5*s.* per ton more than from Oldham."

Messrs. Edward Leach and Sons, machinists, give the above statements, who have frequent complaints from their customers.

Mr. Johnson, a timber merchant, states that in a cargo of timber it cost him 90*l.* more for carriage than if sent to Oldham.

There is also a very considerable advantage to Heywood.

" Hull to Rochdale	Twigs for ship making	26*s.* 6*d.* per ton.
Ditto to Manchester ...	Ditto	ditto 20*s.* per ton.
" Tongh station, Over Darwen near Blackburn	to Manchester	9*s.* 2*d.* per ton.
	to Rochdale	12*s.* 6*d.* per ton
	to Oldham	10*s.* per ton."

The complaints of the Association were investigated with as little delay as possible, and on the 23rd of February I addressed to Mr. Fletcher the following letter :

" Lancashire and Yorkshire Railway,
" Traffic Manager's Office, Manchester,
" February 23, 1861.

" Sir,—

" In reply to your letter of the 13th inst., addressed to Mr. Lawn, our secretary, I beg to inform you that the rates, not only between Rochdale and the various places referred to at the interview which your deputation had with our Board, and also referred to in your letter now before me, but likewise the rates between many other places and Rochdale, have been carefully considered and revised.

" I may state in the first place that there has been a general revision of rates to East Lancashire stations and other places west of Rochdale, also to some Yorkshire stations, and to stations on foreign lines, and as a general rule they have been made consistent with the Oldham rates, taking into consideration all the circumstances connected with each case.

" The list is a very long, intricate, and elaborate one, and I cannot conveniently furnish you with a copy of it, nor do I think it necessary to do so. I am, however, of opinion that the tradesmen of Rochdale will find that we have endeavoured to meet their wishes in a fair and liberal spirit.

Referring to the particular cases in the memorandum which accompanied your letter of the 13th, I may state that for old boilers between Market Harborough and Rochdale, if broken up, the rate is reduced to 16*s.* 8*d.* per ton.

" Old metal, Hull to Rochdale. You are in error in this matter, as the rate both to Rochdale and Oldham is 12*s.* 6*d.* per ton.

" Burton and Holme to Rochdale. The rates are the same as to Oldham, viz., 27*s.* 6*d.* for heavy machinery, and 20*s.* for scrap iron.

" Clerk to Rochdale. We are in communication with the Great Western Company with a view to the modification of the rate for scrap iron.

" The rates for cotton from Liverpool to Rochdale, Oldham, Heywood, and many other places are agreed between the Bridgewater trustees, ourselves, and other companies interested between the same places, and we cannot alter them without consulting those parties. Your representation, however, shall be submitted to them for consideration.

" The same remarks apply to the rate for flour for sizing purposes, and also to that for timber.

" Haslingden and Tongh rates have been revised along with other rates west of Rochdale.

" Rochdale to Stroud, for heavy machinery. The rates are the same as to Oldham, viz., 25*s.*; you are, therefore, in error on this point.

" Rochdale and Liverpool for machinery. You are also in error as regards these rates, as I think you will find them the same as Oldham.

" I trust you will accept this communication as evidence of our desire to meet your reasonable wishes; and I may add that if hereafter any rate is discovered which is manifestly erroneous and unjust I shall be prepared to inquire into it on hearing from you.

" I am, &c.
(Signed) " James Smithells."

" Mr. James Fletcher,
" Secretary, Tradesmen's Association,
" 4, Ackers Street, Rochdale."

On the 8th February 1865, the rates for the carriage of goods between Rochdale and the following stations on the Lancashire and Yorkshire line were reduced, viz. :

Huddersfield	Harwich	Haslingden
Mirfield	Preston	Helmshore
Leeds	Sough	Baxenden
Holmfirth	Over Darwen	Accrington
Shepley	Blackburn	Mill Hill
Moses Gate	Clitheroe	Hoghton
Bolton	Chatburn	

The through rates to the following stations upon other lines were also reduced as soon as we could obtain the assent of the respective companies who were parties to them, viz. :

Caraforth	Staveley	Penwith
Burton & Holme	Windermere	Plumpton
Milanthorpe	Low Gill	Southwaite
Oxenholme	Tebay	Carlisle
Kendal	Shap	Bristol
Burnside	Clifton	

On the 25th February, the following paragraph appeared in the " Rochdale Observer " newspaper :

" Railway Accommodation.

" The directors of the Lancashire and Yorkshire Railway Company have completed their promised revision of the table of rates of carriage for goods booked to East Lancashire stations and other places west of Rochdale, and the result was notified to the secretary of the Rochdale Tradesmen's Association (Mr. Fletcher) yesterday, by Mr. James Smithells. The rates have been revised with special reference to the representations of injustice and overcharge made in the memorial of the Tradesmen's Association, and in the correspondence of Mr. Fletcher, but it has not been confined solely to this station. The general result of the revision was pointed out in a paragraph which we published in our last impression, in anticipation of Mr. Smithell's communication. Taking the Oldham rates as their standard, the object of the directors has been to make the rates to Rochdale and other places to the west of this town uniform and consistent, of course taking into consideration the circumstances connected with each case."

" But, Mr. Smithells adds, that the tradesmen of Rochdale will find that the directors have endeavoured to meet their wishes in a fair and liberal spirit."

" Going into details, Mr. Smithells explains that by the new table of rates, old boilers between Market Harbro' and Rochdale, if broken up, will be charged 16*s.* 8*d.* per ton, and that the tradesmen are in error in supposing that the charge for old metal from Hull to Rochdale is higher than the charge to Oldham, the charges being identical, 12*s.* 6*d.* per ton. The rates of charge from Burton to Rochdale and Oldham also correspond, being 27*s.* for heavy machinery, and 20*s.* for scrap iron."

" The directors are in communication with the Great Western Company with a view to the modification of the rate of scrap iron from Chirk to Rochdale."

Mr. Smithells adds,—

" The rates for cotton from Liverpool to Rochdale, Oldham, Heywood, and many other places, are agreed between the Bridgewater trustees, ourselves, and other companies interested between the same places, and we cannot alter them without consulting those parties. Your representation shall, however, be submitted to them for consideration. The same remarks apply to the rate for flour for sizing purposes and also to that for timber. Haslingden and Tongh rates have been revised along with other rates west of Rochdale."

" The rates of carriage between Rochdale and Stroud, and Rochdale and Liverpool, for machinery, are the same as those to Oldham, and therefore need no rectification."

" Mr. Smithells trusts that the Association will accept this communication as evidence of the company's desire to meet their reasonable wishes," and adds, " that if hereafter any rate is discovered which is maniestly erroneous and unjust, the directors will be prepared to inquire into it."

On the 13th May 1865, I received from Mr. Fletcher the following letter :

"Rochdale Merchants' and Traders' Association,
"SIR, "Rochdale, May 13, 1865.

"In your letter to me of the 23rd of February last, you were kind enough to say, speaking of rates of carriage for goods, that if hereafter any rate was discovered which was manifestly erroneous and unjust, you would be prepared to inquire into it on hearing from me. I have therefore no hesitation in again troubling you with a few particulars as to the changes on your line given on the authority, and indeed coming within the experience of a member of our committee.

"For instance, he states with respect to Haslingden station that the rate to Rochdale for machinery is 10*s.* per ton; to Manchester, 6*s.* 4*d.*; and to Oldham, 8*s.* 4*d.*

"From Lancaster station the rate to Rochdale for machinery is 12*s.* per ton; from Bay Horse station, being four miles nearer Rochdale, the rate is 17*s.*; from Bentam to Oldham, Bentam being 15 miles above Lancancaster, consequently 21 miles farther in distance than from Lancaster to Rochdale, the rate is 10*s.* per ton.

"From Halifax to Manchester, 14*s.* a ton.
Do. to Oldham, 14*s.* a ton. } Machinery.
Do. to Rochdale, 16*s.* a ton.

"The same gentleman remarks that he does not find the revision of rates to East Lancashire and other places west of Rochdale that were promised in your letter alluded to.

"I am, &c.
"JAS. FLETCHER,
"James Smithells, Esq." "Secretary."

On receiving this letter I immediately desired our goods manager to meet the complainants, and he did so by appointment on the 27th of that month, and forwarded to me in London, where I was engaged on Parliamentary business, the following report of his interview with them :

"ROCHDALE RATES.

"Lancashire and Yorkshire Railway,
"Goods Manager's Office, Manchester,
"DEAR SIR, "June 27, 1865.

"In accordance with the request contained in your letter of the 22nd May last, I had an interview on the following Saturday (27th) with Mr. Fletcher, the secretary of the Rochdale Tradesmen's Association, and two of the members, Mr. Lawton and Mr. Chadwick, who accompanied him and I satisfied them that the whole of the representations made in their letter addressed to you on the 13th May were incorrect. It appeared from the explanation made by Mr. Lawton and Mr. Chadwick, who are machine brokers, that the rates had been quoted at the sending station, and I have no doubt that when the application for them was made, the traffic was represented as old iron, consequently the rate for 'scrap' would be quoted.

"The parties are scrap iron dealers as well as machine brokers, and I know from experience that such men intentionally represent old machinery as scrap iron, in order to get the lower rate quoted. I told both Lawton and Chadwick that in order to prevent any misunderstanding in future, they had better write to me stating between what places they require rates, and I would furnish them with a correct statement, but I have not yet heard from them on the subject.

"I am, &c.
(Signed) "A. ORMEROD."
"To Jas. Smithells, Esq."

Since that time, with the concurrence of the Duke of Bridgewater's trustees, a reduction has been made in the rates for sizing flour from Liverpool to Rochdale from 11*s.* 4*d.* to 8*s.* per ton, and we, in conjunction with the Duke of Bridgewater's trustees and the London and North-western Company, have now under consideration the rates for cotton and other articles between Liverpool and Rochdale and other neighbouring towns, with a view to the alteration of such rates as may appear to require it.

As to passenger trains and fares,

The directors, on the 1st January 1865, unsolicited by the public, reduced the fares for return tickets from Rochdale to Liverpool :—

First class, from 11*s.* to 10*s.*
Second class, from 8*s.* to 7*s.* 3*d.*

And in addition, they gave the public the opportunity of travelling either *viâ* Manchester or *viâ* Bury, with a single ticket, or of going by one route and returning by the other, with a return ticket. Previously these tickets were available by the Bury route only.

Prior to January 1865, several reductions were made in the fares between Rochdale and Liverpool, as will be seen from the following table :—

	Single Tickets.			Return Tickets.		
	1st.	2nd.	3rd.	1st.	2nd.	3rd.
Fares previous to—	*s. d.*	*s. d.*	*s. d.*	*s. d.*	*s. d.*	*s. d.*
September, 1854	7 0	5 8	3 5½	13 6	10 6	..
September 1st, 1854	7 0	5 0	3 0	12 0	9 0	..
September 1st, 1856	7 0	5 0	3 0	11 0	8 6	5 6
January 1st, 1864	...	..	..	..	..	6 0
December 1st, 1864	7 0	5 0	3 0	11 0	8 0	6 0
January 1st, 1865	7 0	5 0	3 0	10 0	7 3	6 0
The fares which the company are empowered to charge, according to their Act of Parliament, being	9 2	7 4	3 5½	18 4	14 8	7 0

The passenger train accommodation, and fares between Rochdale and Manchester, were carefully considered by the directors after their interview with the deputation from Rochdale, on 11th January 1865, and they decided to establish a special service of trains between Rochdale and Manchester, charging a fare of 8*d.* for the single journey, and 1*s.* for the double journey, for 3rd class passengers. These additional trains commenced to run on the 1st March 1865, at the following hours :—

	a.m.	a.m.	p.m.	p.m.	p.m.	p.m.
From Rochdale.....	7.30	9.15	12.10	2.0	4.30	7.45
From Manchester...	8.15	11.15	1.15	4.0	7.15	...

Composite carriages were attached to each of the trains for the purpose of enabling holders of ordinary 1st and 2nd class tickets to travel by them, thus increasing the ordinary train service.

The following table shows the daily passenger train accommodation between Rochdale and Manchester at the present time, by which the directors believe the requirements of the inhabitants of Rochdale are fairly provided for :—

WEEK DAYS.

From Rochdale to Manchester.	From Manchester to Rochdale.
7.20 a.m.	5. 0 a.m.
8.23 „	6.15 „

7 trains.	10.15 „
	8 trains.

J. Smithells, Esq.

23 Feb. 1866.

The fares between Rochdale and other towns were also revised, and reductions were made to the following places:

Ashton	Luddendenfoot	Bradford
Staleybridge	Sowerbybridge	Leeds
Walsden	North Dean	Holbeck
Todmorden	Halifax	Thornhill
Eastwood	Elland	Horbury
Hebdenbridge	Brighouse	Wakefield and
Mytholmroyd	Cooperbridge	Normanton.

The fares in operation previous to this reduction were all considerably below the authorized fares of the company.

The directors did not consider it necessary to make any alterations in the ordinary fares between Rochdale and Manchester, because, in the first place, they did not believe the necessities of the public were such as to require it, and in the next place, because the fares then charged were considerably below the parliamentary power of the company, as will be seen by the following table:

FARES BETWEEN MANCHESTER AND ROCHDALE.
Distance, $10\frac{3}{4}$ miles.

	Single Fares.			Return Fares.		
	1st.	2nd.	3rd.	1st.	2nd.	3rd.

Fares requested by witnesses.	...	...	...	2 0	1 6	1 0

Subsequently the following correspondence passed between the Association and the railway company:

RAILWAY ACCOMMODATION FOR ROCHDALE.

"The Rochdale Tradesmen's Association,
"Rochdale, 8 April 1865.

"SIR,

"I BEG that you will notify to the Board of Directors of the Lancashire and Yorkshire Railway Company that the concessions made on the 1st March do not by any means come up to the promises that were held out to the deputation in their interview, and also contained in your letter.

"The committee waited this month in expecting that the directors would make further alterations in the trains. I may add that the committee and members of the Association, as also the public of Rochdale, are much disappointed at the small modicum of relief extended, and the committee think yet, that your directors would act wisely in altering the fares to those asked for by the deputation, viz., 2*s.* first class, 1*s.* 6*d.* second, and 1*s.* third for return tickets to Manchester, these fares to be available for every train. It is well known that almost all the second-class passengers, and many of the first, take advantage of the special trains, who would be glad to give 1*s.* 6*d.* for second. The committee admit that the extra trains are very useful. It is also a general complaint that the fares to Bury and other places are not reduced.

"I am, &c.
(Signed) "JAMES FLETCHER,
Secretary."

"W. S. Lawn, Esq.

"Lancashire and Yorkshire Railway,

Actual powers of the Company	$2\frac{1}{2}$*d.*	2*d.*	$1\frac{1}{4}$*d.*	1*d.*

Per mile, and 5 per cent. additional for Government Duty, except upon parliamentary fares of 1*d.*

As to Rochdale Sunday trains (*Questions* 1333 *to* 1344).

No complaint has been made to the company by the public of Rochdale, nor was the subject mentioned in the memorial presented to the directors in January 1865; the first intimation they received of this complaint was from the evidence given by Mr. Blackburn before this Commission, to which I called their attention, whereupon they ordered that from the 1st of January 1866 the following additional trains should be run:—

	1	2	3
	a.m.	a.m.	a.m.
Rochdale to Manchester ...	8.20	3.30	8. 0
Manchester to Rochdale ...	8.55	4.10	8.40

As to first-class fares, Rochdale to Bury (*Question* 1368).

The distance is $7\frac{1}{4}$ miles, and the fares are as under:—

	Single.			Return.		
	1st.	2nd.	3rd.	1st.	2nd.	3rd.
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
Present fares -	1 2	0 10	0 7	2 0	1 6	...
Authorized fares -	1 9	1 5	0 $7\frac{1}{4}$	3 6	2 10	...

As to rates, Hull to Rochdale and Oldham (*Question* 1415).

The rate to Oldham is less than to Rochdale, because the London and North-western route to Oldham is 82 miles, against the Lancashire and Yorkshire route of 95 miles to Rochdale, the rate to Oldham being governed by the shortest route.

As to rates for machinery from Halifax (*Question* 1423).

	Actual Rate.	Rate quoted by Mr. Lawton.
	Per ton.	Per ton.
	s. d.	s. d.
To Rochdale - - -	11 0	16 0
„ Oldham - - -	14 2	14 0
„ Manchester - - -	14 2	14 0

As to second-class return tickets, Rochdale to Bolton (*Question* 1423).

The distance is 22 miles.

	s.	d.
The second-class return fare is	2	6
The authorized fare	3	10

As to fares between Middleton and Rochdale (*Question* 1423).

Distance 6 miles.

	Single.					
	1st.		2nd.		3rd.	
	s.	d.	s.	d.	s.	d.
Actual fares	1	3	0	10	0	6
Authorized fares	1	6	1	3	0	6

As to fares, third class, Preston to Todmorden (*Question* 1423).

The distance *viâ* Burnley is 31 miles, and the fare is 2*s.* 6½*d.* for third-class passengers.

The distance of 42 miles referred to by Mr. Lawton is by the Bolton route.

12,988. Are the fares as between Manchester and Rochdale higher than on other portions of the line ?—No.

12,989. On what ground do the inhabitants of Rochdale expect to have lower rates ?—On some portions of our line the fares are higher than those which are charged to the Rochdale people, and on some parts of the line the fares are lower. Between Bury and Manchester the fares are lower, and the Rochdale people think they should have them at the same rate. We think otherwise. First of all, the distance is not the same, the circumstances are not the same, and the charge in itself that we make to Rochdale is a very low first-class fare. A return ticket is now 3*s.*, the Parliamentary powers give us 4*s.* 10*d.*, and they ask us to reduce the return ticket to 2*s.* The second-class fare is 2*s.*, and we have power to charge 3*s.* 10*d.*, and they ask us to charge only 1*s.* 6*d.* We submit that that is a reduction that we ought not to make, especially as we are running, for the accommodation of the Rochdale people, special trains in compliance with their wishes. We have the most perfect service of trains for them, which are worked at special cost.

12,990. It appears that on week days you run 20 trains a day from Rochdale to Manchester, and 19 from Manchester to Rochdale ?—Yes.

12,991. Are the fares which they ask for actually adopted on any part of your line, as low as 2*s.* for a return ticket ?—Yes, on some parts of it, where the distance is less from Manchester, but this is the ordinary charge which is made under similar circumstances.

12,992. Is not the traffic very much of the same description between all the large towns through which your line passes ?—Yes, it is very much the same, except this, that there is very near Manchester what may be called an omnibus traffic, and we charge a very low rate, or we should not carry the people at all, where there is a very excellent turnpike road. Between Bury and Manchester the road is eight miles in length, and our line is 13 miles by one route and 10 by another, therefore in order to carry the traffic we must take a low rate. From Rochdale the turnpike road is not a good one, and the circumstances are not the same, and we say that as the fare we charge is very considerably below that which our Parliamentary powers enable us to charge, we do no injustice to Rochdale. I may mention that I met at the Euston Hotel last week one of the most complaining gentlemen in Rochdale, but he said that we had really served Rochdale well with trains and accommodation.

12,993. In how many of the trains between Rochdale and Manchester do you carry third-class passengers ?—There are six trains put on specially at a low fare, and, as I have observed before, 8*d.* is the charge for a single journey between Rochdale and Manchester, and 1*s.* for a double journey. We attach to those trains carriages for first and second-class passengers so as to increase the accommodation for those classes as well.

12,994. Do those third-class trains carry a very large number of passengers ?—Yes, they do, and they have the effect of drawing from the other classes of carriages passengers who otherwise would pay a higher fare.

12,995. Would it be prejudicial to railway companies to attach third-class carriages to all trains ?—I think so.

12,996. Would it not be an advantage to the public ?—I should scarcely call it an advantage. Our district is full of men who have risen by their own industry and energy, but their economy is such, although they occupy a respectable position in life, that if third-class carriages were put on with every train they would avail themselves of them. I think that many persons who take advantage of third-class trains ought not to do it, and it would not be a boon to the public in that respect.

12,997. (*Lord Stanley.*) When you say they ought not to take advantage of the third-class trains, is it not a mere matter of choice with a man whether he will submit to rougher company and more imperfect accommodation ?—Yes ; but still we think that when a man has amassed a fortune it is natural to expect that he would travel either second or first class.

12,998. (*Sir R. Hill.*) Generally speaking, do not trains to which third-class carriages are not attached run more quickly than the others ?—Yes, the Parliamentary trains that stop at every station, they are slower ; but the express third-class trains that we run between Manchester and Rochdale, and Manchester and Bury, are really express trains, and they are the best trains we have. I travel by them daily, and they are most expeditious, the object being to accommodate the traffic between the two points specially. We run past the intermediate stations. I travel every night by the cheap trains.

12,999. Do they run as quickly as the dearer ones ?—Yes.

13,000. (*Earl of Belmore.*) Do you find that third-class passengers often travel long distances ?—Not very long distances in our district. Our district is essentially an omnibus traffic district. I think that the average distance travelled over our line by all the passengers is about 10 miles, and the average fare paid by them is 9*d.* We carry more passengers than any line, I think, in the kingdom. Last year we carried above 20,000,000 of passengers, and the average distance they travelled was rather under 10 miles, including both the first, second, and the third classes and the excursion passengers.

13,001. (*Chairman.*) Are the majority of the third-class passengers working men, or is any considerable number of the persons above that condition of life ?—The majority of them are working men.

13,002. Do the small shopkeepers travel much in third-class carriages ?—Yes, especially in the cheap trains between Bury and Manchester and Rochdale.

13,003. The next point referred to is the Rochdale Canal case, in answer to question 10,041 ?—Yes. From 1850 to 1856 there was an arrangement between the Rochdale Canal Company and the Lancashire and Yorkshire Railway Company for a division of traffic ; and on the 1st of September 1855 the Lancashire and Yorkshire, the Manchester, Sheffield, and Lincolnshire, the North-eastern, and the London and North-western Railway Companies leased the tolls of the canal for a term of 21 years. This lease was entered into mainly in consequence of an attempt on the part of the Aire and Calder Navigation to force the railway companies to make an arrangement by which the Aire and Calder would secure a division of the traffic passing westward to Liverpool, Manchester, and other places.

The toll, which was increased from 1*d.* to 4*d.* a ton, was levied upon bale goods only ; and it is important to observe that this was a class of traffic which the Aire and Calder Navigation had not for many years previously carried over the canal ; and therefore this increase of toll was not a tax upon traffic which had been enjoyed or carried by them up to that time, the fact being that the Aire and Calder Company, with a view to force an arrangement with the railway compa-

J. Smithells, Esq.

23 Feb. 1866.

nies, either for a division of traffic or for an amalgamation, attempted for a time to destroy the most valuable traffic of the railways—the bale traffic—between Manchester and Hull, by carrying it at a rate from 40 to 50 per cent. below the ordinary rate; and under these circumstances the railway companies, in their own defence, advanced the toll to 4*d.* per ton, as stated in Mr. Wilson's evidence.

From the evidence of Mr. Wilson he appears to be strongly opposed to amalgamations. He has, however, omitted to inform the Commission that in 1856 and 1857 negociations, in which he, on behalf of the Aire and Calder Company, took an active part, were entered into between the Aire and Calder Navigation and the North-eastern and Lancashire and Yorkshire Railway Companies for an amalgamation of the Aire and Calder Navigation with those railways, it being provided that until Parliamentary sanction to that amalgamation had been secured, the railway companies were to lease the tolls of the navigation for a term of 21 years, on the understanding that the lease was to expire on the completion of the transfer of the navigation under the Amalgamation Act. These negociations did not, however, result in an arrangement. Mr. Wilson has also omitted to state that the Aire and Calder Navigation last year leased the Calder and Hebble Navigation whichiconnects the Aire and Calder Navigation with the Rochdale Canal; and that he has since that time urged upon the railway companies, through me, the necessity for their making an arrangement with the Aire and Calder Navigation by which that navigation shall have an interest in the traffic of Liverpool, Manchester, and the west, and thus prevent competition.

13,004. (*Lord Stanley.*) I see in the evidence of Mr. Wilson, in answer to question 9915, which is, "Is it your experience in general that when a rail "way company obtains possession of a canal the tolls "are raised to the highest point?" he states, "Not "always to the highest point, but to a sufficiently "high point to prevent traffic passing. They cau- "tiously avoid going to an unnecessarily high rate, "because it might be brought out in evidence in the "numerous instances when they come before Parlia- "ment, but they always raise it to a sufficiently high "point to exclude traffic"?—Yes.

13,005. Is that in any case true as to the company with which you are connected?—No doubt the raising of the tolls has had the effect of placing upon the railway traffic which probably might have been carried by the canal, had not arrangements been made with the traders to carry by railway, and to carry at rates as low, and in many cases lower, than those which existed on the canal, and more expeditiously.

13,006. Then in that case what advantage do you gain by making the rates higher upon the canal?—We find that we can work the traffic onwards upon the railway more advantageously than upon the canal, First of all we require expedition in the conveyance of the general merchandise of the line, and we find it better to concentrate it as much as possible upon the railway.

13,007. Will not the ultimate result of that be that it will be worth your while to hold the canal without working it at all?—Scarcely so; of course there are by-traders upon the canal, and we do not close the canal; we still have the tolls in operation, by which the public, by paying, can carry advantageously.

13,008. You do not, yourselves, carry to any extent, but you allow other persons to carry?—We carry ourselves, and also allow the public to carry.

13,009. (*Sir R. Hill.*) The tolls you charge, I presume, are fixed by Act of Parliament?—They are.

13,010. You do not exceed them?—No; in some cases they are less.

13,011. (*Chairman.*) I believe there is only one canal that actually belongs to your company?—Only one, the Manchester and Bolton.

13,012. You have an interest with other companies in other canals that you have leased for a term of years?—Yes; the Rochdale Canal and the Leeds and Liverpool Canal.

13,013. When those leases expire, you will be unable, as the law at present stands, to renew them?—Yes, without the sanction of Parliament specially obtained.

13,014. (*Lord Stanley.*) Acting upon the policy you have described, is it worth your while to go to the expense of any costly repairs of the canal works?—The canal company maintain them; they are let under lease. On the Leeds and Liverpool Canal we do not lease the tolls for the minerals, only for the merchandise.

13,015. (*Chairman.*) Mr. Wilson, I think, gives it as his opinion, that the railway companies lose upon a considerable portion of the goods carried both upon canals and railways, but that they make up that loss by their profits on the passenger traffic?—Mr. Wilson, I think, is wrong there, and I am surprised that he should have given that answer; at all events the railway companies are not influenced by any such principle or motive.

13,016. Do you think that any of the goods traffic is unprofitable?—Yes, I do.

13,017. What motive induces your company to go on carrying traffic that is actually unprofitable?—We do not like to obstruct it. In the town in which I live I am sure that the merchandise traffic which is carried to Manchester does not pay us, and we should be better without it. The traffic from Bolton to Manchester we should be better without. We have the bleachers' traffic, which we carry without any profit, but to the bleachers it is an important traffic, and they require their traffic to be carried expeditiously. We carry it at a very low rate, and with very great regularity; but, of course, they have other business upon other parts of our line. We take a broad view of it, and although we lose upon one portion, we make a profit upon the other; our desire is to accommodate them, and that guides us in all our transactions.

13,018. What prevents your raising your charges on that portion of the line which you say does not pay, to an amount that would make it profitable?—The traders and bleachers say that, by making arrangements, they can probably cart the goods themselves from their places to the town, and so save the terminal expense at Manchester, and in consequence of that we have to adapt our charge to the circumstances of the case, rather than lose the traffic altogether.

13,019. (*Sir R. Hill.*) If you lose upon the traffic, would it not be better to let the bleachers make their arrangements?—We think that the railways are made for carrying the traffic of the district, and we desire to make them as useful as possible for that purpose. We do not like to see the traffic pass us, but we rather adapt our rate to the circumstances than lose the traffic, that is what influences us.

13,020. Are your directors so goodnatured as to carry traffic at a loss for the advantage of the public?—It is the fact that we do, and it is true that I have often spoken to my directors on the same subject. Some of them are strongly impressed with the idea, as I am, that it is not a paying traffic, the short traffic, and that we should be better without it, for it encumbers our stations as much as the traffic that comes a longer distance.

13,021. (*Earl of Belmore.*) Might it not happen, if the bleachers carted all the traffic, which it does not pay you to carry from Bolton to Manchester, that instead of sending their carts back empty, they might take return loads which it would pay you to carry?—Yes, and that of course influences us, not only at Bolton, but at other places.

13,022. (*Mr. Gower.*) Are the shareholders aware of this state of things?—We can defend it before them, because we believe that it is in their interest. Take, for instance, the Oldham traffic from Oldham to Manchester, it does not pay us, but, as the noble Lord has just said, they send their carts with their manufactured goods to Manchester, and then the carts have to go back empty unless they get some loading. They might get their cotton by the canal from Liverpool, and cart it from Manchester to the works. If we charge a reasonable rate from Oldham to Manchester for the manufactured goods, and no cart of their own goes to

Manchester, the cotton will come from Liverpool to Oldham direct by our railway, and that is the compensating element to us.

13,023. (*Chairman.*) Is much traffic carried on by carts on the high roads?—Yes, a very large traffic from the towns round Manchester, although we charge a very low rate.

13,024. You think that it would be prejudicial to the interests of your company not to obtain as much traffic as possible, although it is unremunerative?—Yes. We cannot afford to say, we not will take it, and as contrasted with the general traffic of the company, it is only a very small per-centage.

13,025. (*Sir R. Hill.*) You cannot afford to give up a losing traffic?—No, because incidental to that, we do carry a traffic that is profitable, and which we might lose, if we did not carry the other.

13,026. Taking it altogether it is not a losing traffic?—No, as is evidenced by the dividends we pay, we do get a dividend out of it.

13,027. (*Chairman.*) Would it have had effect upon the prospects of a railway company if it was known to refuse traffic which it might obtain by charging low rates?—I think it would encourage competing lines. It is a most popular reason for introducing new lines, that of obstructing traffic, and plenty of witnesses would be glad to come to Parliament and give evidence against us, and say, "These gentlemen will not carry our traffic," and no doubt that influences us.

13,028. Was there not at one time a very strong competition between your company and the Aire and Calder Navigation?—Yes, there was some competition. They desired to sell their undertaking, and, as I have stated, negociations were entered into between the Aire and Calder Navigation, the North-eastern Railway, and the Lancashire and Yorkshire Railway Company for an amalgamation of the Aire and Calder Navigation with those two railways.

13,029. What caused that negociation to break down?—I do not know the precise causes, for it was before I joined the Lancashire and Yorkshire Company, but they had got so far as to have the heads of an agreement settled, I have a copy of them, in fact the document was complete all but signing. I think Mr. Wilson is a little incorrect in saying that he objects to amalgamation under certain circumstances.

13,030. (*Sir R. Hill.*) Have there not been instances in which the Aire and Calder Navigation has amalgamated with railway companies?—Not amalgamated. The Aire and Calder Navigation did make a traffic arrangement of some kind; I do not know the nature of it, but they have made an arrangement with the North-eastern Company for a division of traffic, or an arrangement which will prevent a reduction of the rates, and the Aire and Calder have amalgamated with other canals. In the last year they leased the Calder and Hebble Navigation, and sometime ago they leased the Barnsley canal, that was all done by Mr. Wilson, on behalf of the Aire and Calder Navigation.

13,031. Do you not know of any instance in which they have amalgamated with a railway company?—I do not; I believe they have not amalgamated with any railway company, other than making a traffic arrangement with the North-eastern Company.

13,032. I understood that by your arrangement with regard to the Rochdale canal, you had been able to stop a certain traffic over the Aire and Calder Navigation?—Yes; we have been able to prevent them from destroying the traffic, their object being, as we believe, and indeed we know, for letters are in existence to show, that their object was to reduce the rates so as to force an arrangement.

13,033. Their object was to take away the bale traffic from you?—For a time.

13,034. They had not been in the habit of carrying it?—No, not for many years.

13,035. They made an attempt to take it from you, and by raising your tolls on the Rochdale canal, you were able to frustrate that attempt?—Yes, that is the truth.

13,036. You have stated that a great number of witnesses are anxious that there should be uniform rates per mile upon all railway systems?—Yes.

13,037. Is it your opinion that if that system were adopted on one railway the same rate must be adopted on all railways?—Yes.

13,038. Will you be good enough to explain why that would be the necessary result?—My views as to equal mileage rates are as follows:—

Between towns which are at present served by two or more competing railway routes, of unequal length, the effect would be to drive the traffic to the shortest, because it would be the cheapest route. For instance, between Liverpool and Manchester, Liverpool and Huddersfield, Liverpool and Leeds, and between many other places, the Lancashire and Yorkshire and London and North-western Companies have each a route, the London and North-western being in many cases shorter by several miles than the Lancashire and Yorkshire; and if on account of our greater distance we attempted to charge the public a higher rate than the London and North-western charged, we should drive the traffic from our line, and overcrowd the line of the London and North-western company.

The effect upon traffic carried in connexion with other companies at through rates would be equally injurious to the longest route—for instance, the Lancashire and Yorkshire and London and North-western Companies join the North-eastern railway at Normanton, and they have each a route between Normanton and Manchester, and Normanton and Liverpool, but the Lancashire and Yorkshire routes are the longest, the application of the principle of an uniform mileage rate would, in these cases, give to the London and North-western Company the whole of the North-eastern traffic, and again overcrowd the London and North-western route, although the Lancashire and Yorkshire railway was originally the only line between Manchester and Normanton, and was constructed at a very great cost for the purpose of carrying that and other traffic. If an uniform mileage rate, based upon the highest rates the companies charge or upon the maximum tolls which they are authorised to charge, was adopted, the effect between places where there is at present both railway and water competition would be to give to the routes by water absolute control of the traffic, and so place the railways under a disadvantage. If an uniform mileage rate was based upon the lowest railway rates in operation, the companies would lose a large revenue upon the traffic which is now carried at ordinary rates. In both cases the effect would be to reduce to the minimum the area and number of markets from which the inhabitants of any town or place could draw their supplies of food, clothing, or materials for consumption or manufacture, or to which they could send commodities for sale.

Railway companies by their present practice of adapting their charges to the requirements of the traffic have rendered greater service to the public than to their shareholders, and to make railways alike useful and profitable to the shareholders and to the public, the companies owning them must, within the powers granted to them by Parliament, be allowed to fix and regulate their rates and fares according to circumstances; if anything is done to interfere with the free exercise of that principle it will be alike detrimental to the interest of the country and to railway companies themselves.

13,039. (*Lord Stanley.*) Your objection to a uniform mileage rate, as I understand you, is, that it would necessarily drive all the traffic upon the shortest line?—Yes.

13,040. That is to say, if there were two lines, one 35 miles long, and the other 40 miles long, between the same points, you could not use the line 40 miles long as a relief line to the shorter one?—Just so.

13,041. You would be compelled by law to charge a higher rate, although you might be quite willing to give in the advantage of the extra five miles?—Yes; and we should be deprived of the power of doing that which we now do. The North-western and our railway in many cases run between the same places in Lanca-

J. Smithells, Esq.

23 Feb. 1866.

shire and Yorkshire; our line in the majority of cases is the longest, but at present we charge the same rate, or the public would leave our line. An equal mileage rate would drive the traffic from our route altogether, and place it on the North-western line.

13,042. (*Sir R. Hill.*) Suppose a uniform rate were charged, not according to the distance by railway, but by the direct distance as the crow flies, the difficulty in establishing uniform rates by two railways serving the same towns, although one was longer than the other, would be removed?—Do you mean competing between two places, such as Liverpool and Leeds?

13,043. Yes?—There the North-western and the Lancashire and Yorkshire Companies have each a route, and practically the rates are so arranged that we have some of them measured by the shortest distance. The London and North-western line we may call as the crow flies, a straight line, and that is the line which governs the rate, and we adopt that rate. But that would not meet the case of a competing port; it would not serve the purpose of the public when you came to apply it to a port like Hull.

13,044. But as between railway and railway, there would be no objection to a uniform mileage rate, if the distance were taken as the crow flies?—That means a uniform rate; it is only another term for the same thing, that is really what we do.

13,045. There would be no objection to a uniform mileage rate if the distance were taken as the crow flies?—No; I do not see any objection, if qualified as I have before stated.

13,046. (*Lord Stanley.*) You mean that there would be no objection on that ground?—Yes.

13,047. Do you think that a uniform mileage rate would be fair in the case of a line that cost very much to make, and in the case of a line that had been made in a very inexpensive manner?—No, I do not think it would.

13,048. (*Sir R. Hill.*) Can you at all regulate the fares with reference to the cost of the line?—In fixing the fares we do not have reference to the actual cost of the railway.

13,049. On the contrary, does it not generally happen that the fares on the more costly lines are lower than the fares on the less costly lines?—In many cases it is so.

13,050. The most costly lines are generally between places in thickly-populated districts?—Yes.

13,051. And there you generally charge lower fares per mile?—Yes; upon the metropolitan lines which are very costly, the fares are very low.

13,052. What are the objections which you entertain to a uniform rate per mile, regulated, not by the circuitous route of the railway, but by the direct distance?—As between two points where there are competing routes, as I have before said, that really is the principle that we act upon in fixing the rates, but that would not at all meet the case of the Hull merchant. Take a town 40 miles by railway, but only 30 miles as the crow flies from Liverpool; suppose the distance from the same town to Hull is 60 miles, and we charge the same rate per ton per mile to Hull as to Liverpool over the 30 miles, the rate between Hull and that town would be twice as much as that from Liverpool, and Hull would be shut out.

13,053. The principle of charging by direct distance would meet the objections which you have stated?—Yes; if you draw a straight line as the crow flies between two competing points, and say the rate shall be the same by the two routes, that is what we do now.

13,054. (*Earl of Belmore.*) Does not this objection arise in rather extreme cases; for instance, take a passenger who books from the Euston station to Cambridge by the London and North-western line, and you were obliged to charge as the crow flies, you could not reduce the working expenses, and in a case like that the working expenses would not be covered by the receipts?—No; but as a general rule between any competing points they must be the same, both the rates and fares. The Sheffield Company some years ago began competition with the Lancashire and Yorkshire Company between Manchester and Leeds, they carried the traffic nearly twice the distance that we had to carry it, but they carried it at the same rate. We must, between competing points, carry at the same rate as any other company carrying between those points, otherwise we should get no traffic.

13,055. (*Capt. Galton.*) Between London and Paris there are two routes, not competing probably, but the fares by the longer route are much higher than the fares by the shorter route, and yet a very large amount of traffic goes by the longer route?—I was not aware of that. But my experience certainly is to the effect, that between any two points any company carrying must carry at the same rates as other companies, or they will get no traffic. You must not carry at a higher rate, no matter what the distance is.

13,056. (*Sir R. Hill.*) It has been stated in evidence that the charge from London to Birmingham, whether by the North-western railway or by the Great Western is the same?—Yes.

13,057. The distance by the Great Western railway is much greater than by the North-western, and that principle, as I understand you, is adopted in the case of competing lines?—Yes.

13,058. You charge the same as the other company, whether the route is direct or circuitous?—No doubt.

13,059. I presume you find that a passenger does not consider he is compensated for paying a higher fare by being carried a longer distance?—No, but rather the contrary; I think he would desire to have some allowance for being taken so far out of his way. We have an agreement with the North-western Company for a division of the traffic, and it is provided that the fares and rates between all points must be the same, and without an agreement for a division of traffic, if there is competition, it is at equal rates.

13,060. (*Capt. Galton.*) You contend that competition cannot exist if a uniform mileage rate is charged?—Certainly.

13,061. Therefore, if a railway company were to charge a uniform mileage rate, the present system of working on what are termed commercial principles must be departed from?—Yes.

13,062. (*Earl of Belmore.*) Putting competition out of the question, do you not think it would be unreasonable that the Great Western Company should be obliged to charge as the crow flies from London to Bath where they have no competition, although their line is considerably longer than the distance as the crow flies?—I understood the previous question to apply only to competing routes, when I answered that it is the practice we adopt now; but if it means this, that between two points on our own line, where there is no competition, and where the route is circuitous, we are to charge as the crow flies, I say that that would be evidently wrong and unfair to the companies, that is a principle that I could not for a moment admit.

13,063. Is not the advantage given to a passenger by conveying him over a line measured by taking the direct distance between any two points?—No, not altogether, there are many cases where the route is circuitous, and where we charge the actual distance, and in all cases nearly. It is only where competition comes in that we are obliged to adapt our fares by the circuitous route to the shorter one.

13,064. (*Capt. Galton.*) You contend that if the route was circuitous, and the charge was to be according to the direct distance, your maximum charges ought to be increased beyond the present authorized scale, or they would not be fair to the companies?—Yes.

13,065. (*Sir R. Hill.*) That would not interfere with the adoption of the principle, would it?—It would, because if I have a route which is 30 miles long, but by the crow line the distance is only 20, and I am only to charge the toll which, in the Act of Parliament, is applicable to the 20 miles, I shall lose upon the 30. I should require the maximum tolls to be increased to correspond with the reduced distance. A railway company makes a line at great cost, say 30 miles long, between two points, but as the crow flies the distance is only 20 miles; a toll is granted to the company for the

30 miles, but if I charge only as the crow flies, the maximum rate for 20, I shall be a loser of the difference.

13,066. Supposing the rate was advanced in proportion, the profit must be precisely the same?—If I get the same money as I should by calculating the 30 miles—and it is a question of money—I am compensated.

13,067. (*Chairman.*) In many cases a direct route between two places would be impracticable from the nature of the country?—Yes; for instance, in our district we should have to go through mountains, and we should not be seen for miles; it is a very hilly country. We have long tunnels as it is.

13,068. (*Lord Stanley.*) There would be this additional disadvantage that, whereas in a flat country a uniform mileage rate, charged according to the direct distance, would give a railway company the full advantage of payment for every mile traversed, in a hilly country, where railway routes must make a considerable circuit, you would be paid for, perhaps, only one half of the distance you actually traversed?—Yes; and that applies most strongly to the Lancashire and Yorkshire system. It is a line which has to work its way through valleys; it is circuitous and full of bends.

13,069. For the same amount of service to the public a line in Cambridgeshire would pay double as well as a line in Lancashire or Yorkshire?—Yes. A portion of our line is in the neighbourhood of Doncaster, where they could safely run straight, but in other parts it is very circuitous.

13,070. (*Sir R. Hill.*) Did not your company, some years ago, apply to Parliament for an advance upon your maximum rates on the ground that your line had been very costly, and that it was not profitable?—Yes; but that was before my connexion with the company.

13,071. Then, if in any case the principle of uniform rates, charged by direct distance, were not applicable to a particular line, the maximum, as regards that line, might be advanced as it was in your case?—Yes; but I am afraid the application of the rule would be difficult; of course there would be so many varying cases, and it would be difficult, I think, to compensate a company in all cases that might arise from the adoption of that principle.

13,072. (*Capt. Galton.*) Did you obtain an increased rate?—Yes.

13,073. Having obtained it, to what extent did you apply it. I presume you carry a large amount of traffic at a good deal below the maximum?—Yes, a very large amount.

13,074. What proportion of your traffic do you carry at rates below the maximum?—I really cannot answer that question. Upon some traffic we get what Parliament says we ought to have, but other traffic we carry at a little more than the cost of working.

13,075. As a rule, between what principal places do you charge your maximum rates?—From Burnley, Blackburn, Accrington, and Colne; in those districts we charge pretty nearly the maximum rate.

13,076. The full maximum?—Yes.

13,077. And from other places between Manchester and Liverpool?—We charge less than the maximum rate; between Rochdale and Bury, Bolton, Oldham, and Ashton, and those places, we charge very considerably below, a very low rate indeed, which leaves very little profit, sometimes none.

13,078. Practically, I suppose, the maximum rate upon a small portion of your traffic is levied to make up for the profit which you fail to make in carrying below the maximum rate from the other places?—I do not say that. We fix the rates generally within our Parliamentary powers, and between points where competition by road applies, and which we have to deal with, we are satisfied with a very small profit rather than let the traffic pass us. In some cases, to get a profitable traffic, we carry other traffic at a loss.

13,079. (*Sir R. Hill.*) You charge higher rates over certain parts of your line than over others?—Yes.

13,080. Do you charge higher rates over the most costly and most tortuous parts of the line, and lower rates upon the less costly and more direct portions; or do you pay any regard to the cost of any part of the line, whether it be direct or not?—I must repeat the answer that I gave before when I said that we had very little regard to the actual cost of the railway in fixing the charges.

13,081. Or to its directness or indirectness?—We are guided by commercial considerations mainly.

13,082. (*Chairman.*) Did the powers which you obtained a few years ago for charging additional rates apply to goods as well as to passengers?—I believe so.

13,083. Do you in any case charge higher passenger fares for a shorter distance than for a longer one; between Liverpool and Leeds I suppose you are obliged to charge the same fares that the London and North-western Company charge?—Yes.

13,084. For a place short of Leeds on your line would you charge a higher fare than to Leeds?—No; our agreement with the North-western Company prevents it. We generally assimilate the fares to the neighbouring towns to the fares to the competing towns.

13,085. To get the same traffic between Liverpool and Leeds you are obliged to charge a low fare for the whole distance, and all the intermediate places participate to a certain degree in the advantage?—Yes; but the fares that we have arranged to Leeds are good ones.

13,086. It is not a very circuitous route as compared with the London and North-western?—No, it is a very fair route; we divide the traffic with them.

13,087. (*Earl of Belmore.*) Would it be unreasonable to lay down, as a general rule, that a lower fare should not be charged to passengers for a shorter distance than for a longer distance, and under all circumstances?—I think it would be unfair to lay down a rule that a passenger for a short distance should be charged the same rate per mile as the passenger for a long distance.

13,088. I did not say "per mile." Take this case; there are two routes from London to Cambridge, one by King's Cross, the other by Shoreditch; of course the Great Northern Company would not charge a higher gross fare from King's Cross to Cambridge for the longer route than the Great Eastern Company would charge from Shoreditch to Cambridge?—No.

13,089. Then would it be unreasonable to say that the Great Northern Company should not charge a passenger carried to a station short of Cambridge a higher fare than is charged to Cambridge?—I think they should be left, providing the fare which they do charge to a place short of Cambridge is not beyond their Parliamentary powers, to charge what fare they think right.

13,090. (*Chairman.*) You have said that some of the witnesses are very anxious to have a court of appeal or some tribunal established for the purpose of modifying the rates, or investigating complaints as to them?—Yes.

13,091. What is your opinion as to the establishment of such a court of appeal?—I have very carefully considered that question, and this is my view. The establishment of such a tribunal as that suggested would be an injustice to the railway companies who have spent their money on the security of their Acts of Parliament. If such a court was now established I suppose that some of the merchants of Liverpool would apply for the reduction of the Liverpool rates to the same rate per ton per mile as from Hull to the same places, and Hull merchants would, at the same time, apply for the Hull rates to be reduced to the same rate per ton per mile as those from Hartlepool. The applicants having something to gain and nothing to lose would occasion numerous applications which would be a constant source of irritation between the company and its customers, and would occupy much of the time of the general staff of the railway, and distract the attention of the manager and his assistants from their ordinary duties. The courts of law already established afford ample protection to the public against the illegal proceedings of railway companies, or for obtaining compensation for any neglect or default on their part.

J. Smithells, Esq.

23 Feb. 1866.

For the settlement of ordinary disputes and claims the county courts are very convenient, and are appealed to when necessary by the public and by railway companies; the Lancashire and Yorkshire Company have had numerous cases settled in those courts. Occasionally disputes are settled by a friendly arbitration, for instance, within the present year one of our customers, who considered that we had given to another of our customers in the same trade an undue preference, claimed about 600*l.* from us as a drawback. We agreed mutually to leave the question to the decision of the judge of the County Court of Manchester, as arbitrator, and he, after two days' inquiry, decided that the charge was unfounded, and he therefore disallowed the claim. Public opinion, conveyed through the press, through chambers of commerce and tradesmen's associations, is sufficiently effective to deter railway companies from abusing the powers conferred upon them by Parliament, and generally it will be found that, whenever a railway company is appealed to through those channels, the directors are prepared to hear and consider complaints or statements from the public, and to rectify whatever may appear wrong. As an illustration of the practical effect of such appeals upon railway companies, I refer the Commission to the application of the Rochdale Tradesmen's Association to the Lancashire and Yorkshire Railway Company in January 1865. To give power to any court to reduce rates already not in excess of the legal powers of railway companies, would be practically to repeal the toll clauses in their Acts of Parliament, which are their only security for a return upon their capital spent in making their railways, and nothing short of guaranteed compensation from Government could justify such a course, especially as railway shareholders generally receive only as profit dividends upon their capital at a rate very little exceeding the rate of interest which they could obtain if that capital was lent upon ordinary securities, and very little exceeding that which a millowner or manufacturer claims as a right in addition to a profit upon his business.

When millowners and maufacturers, who, as a body, derive great advantage from the use of railways, estimate the profits upon their own business, they deduct from their gross receipts:

1st. Their working expenses.

2nd. Five per cent. interest upon capital.

3rd. Five to ten per cent. depreciation upon cost of working stock; and if after these deductions they have not a balance of profit equal to the per-centage which is paid as dividends to railway shareholders upon their capital, they do not consider their business has yielded any profit.

But to prevent the possibility of railways becoming too profitable, many companies are subject to a reduction of their tolls when their dividends amount to a certain per-centage, per annum; for instance, in the case of the Lancashire and Yorkshire Company, the Amalgamation Act of 1859, clause 78, gives power to the Board of Trade to revise and reduce the present scale of tolls, fares and charges, after the dividend for three years has averaged 8 per cent. per annum.

13,092. Is your objection this, that if such a tribunal was established, it would upset the provisions of your Acts of Parliament?—Yes.

13,093. Short of a tribunal having any power to decide anything contrary to your acts, is not one reason for wishing for such a tribunal to avoid expense, and that complaining parties might have power to appeal to it instead of going before courts of law?—It is a very inexpensive process to go before a county court, and most of the cases are settled there. We have many cases of claims for damage done to goods, and other claims, which we settle in the county courts with very little trouble and very little expense. On the ground of expense I do not see the slightest necessity for such a court.

13,094. Have you many disputes to settle?—Not any very large number. We have constantly to deal with cases of parties claiming for damage done to goods, or perhaps delay or miscarriage, and if we cannot settle the matter amicably, and the parties are unreasonable, or they think we are, we go into the county court and have the matter settled; it is a very expeditious, and not an expensive process.

13,095. (*Capt. Galton.*) Is not the county court limited as to the amount that can be recovered?—Yes, but the majority of our cases are settled in the county court for damage done; the question of principle can be settled upon a small charge. We had a case about 12 months ago with respect to a sum of 6*s.*, which settled a principle, and both parties were satisfied to adopt the decision of the court, and it did not cost more than a couple of pounds to get the whole thing settled.

13,096. (*Sir R. Hill.*) Do you allow packed parcels to be conveyed over your railway?—We do, but there are very few forwarded over our line.

13,097. (*Mr. Gower.*) You say that claims for damage done to goods, if a dispute arises, are settled by the county court. Do you always acquiesce in the decisions of the court?—Generally we do; there may have been some cases, but I do not recollect any at the moment, where we have appealed to a higher court, but generally we are guided by the decision of the county court.

13,098. (*Chairman.*) With regard to disputes respecting rates, is it possible to take them before the county court?—It is very easy indeed. A man can object to the payment of the carriage for a single consignment amounting to 10*s.*, and he may say, I object to pay 2*s.* of this charge. We insist upon payment, and he brings an action in the county court to try the question. There was a case within the last 12 months, in which the amount in dispute was only about 8*s.*, but the principle was settled, and we adopted it. Then in another case, which I have already stated to the Commission, we agree mutually to refer the question to a county court judge, he hears all the parties and then decides between the two. That case involved a large amount, and the parties threatened an action at law, and we thought it better to settle it amicably and adopted that course.

13,099. (*Earl of Belmore.*) Do you generally receive payment for the carriage of goods in advance or afterwards?—Generally after; we have ledger accounts open with an immense number of customers, we have thousands of accounts.

13,100. (*Capt. Galton.*) What length of time do you allow to those accounts?—A month is our stipulated time, very seldom more.

13,101. Is that ever exceeded?—No, that is our universal rule. Of course we get customers sometimes who fail to pay, and then we stop their ledger account. The public have a very great advantage in that system of ledger accounts.

13,102. (*Sir R. Hill.*) If a small parcel is brought to one of your stations, can you receive the carriage upon that parcel to any other station in Great Britain? Not to every station, but to all stations where it is necessary to have through rates. We have through rates with all companies for parcels and passengers so as to accommodate the public.

13,103. But you could not convey the parcel I refer to to any station in Great Britain?—Not where we have not through rates, but generally we have through rates for parcels to all the important places.

13,104. Could you take, for instance, a parcel brought to one of your stations addressed to Brighton?—I think we have through rates with the Brighton Company. I am not quite sure, we have such an immense number of rates.

13,105. But there are certain towns, are there not, to which you could not convey that parcel?—There are some, no doubt.

13,106. And certain towns on the railways?—Yes; to have rates between every station on our line (for we have 200 stations) and every town on a railway in England would be impossible.

13,107. If it happens to be a town or a village beyond a railway, I suppose you cannot then undertake

the conveyance of a parcel to its destination?—If we have not through rates we cannot.

13,108. I am supposing that it is addressed to a town or a village remote from any railway. You cannot then undertake the conveyance of the parcel to its destination, can you? — Yes, we can undertake to forward it, and to hand it over to the company carrying to the nearest station, and then they will have to make their charge forward to the party to whom the parcel is to be delivered.

13,109. You cannot receive the rate upon that parcel to its destination?—No, unless the through rate has previously been arranged; but the principle which we adopt is to make through rates with all the companies in the kingdom to all the important places upon their respective lines where there is a constant interchange of traffic, parcels and so on, but there are many insignificant stations on the lines of other companies, and the same upon our line, where that really is not necessary, where there would not be one parcel in the year perhaps, or at all events not a parcel in a month, and the trouble of establishing through rates is very great. What they are altogether, I cannot tell; but, what with passengers and parcels, they amount to, I suppose, between 3,000,000 and 4,000,000 rates.

13,110. (*Capt. Galton.*) Have you not a uniform charge for parcels up to a given weight?—We have a graduated scale on our own line.

13,111. (*Sir R. Hill.*) Some years ago did you not establish upon your own line a uniform charge for parcels not exceeding a certain weight?—I am not aware that we did. It is not within my recollection; it must have been before my time, if it was so.

13,112. It is not so now, is it?—No; we have a scale according to distance and weight.

13,113. (*Capt. Galton.*) Do you vary it according both to distance and weight?—Yes.

13,114. (*Sir R. Hill.*) That is to say upon your own line?—Yes.

13,115. (*Chairman.*) Have you considered the question of the publication of rates and fares?—I have. The Lancashire and Yorkshire Company have about 2,000,000 of rates, and as these rates are constantly being revised and altered in consequence of changing circumstances or applications from the public, it would be impossible to have constantly exhibited at each of their stations a correct list of the rates in operation.

13,116. You contend that it would be quite impracticable on account of the immense number?—Yes.

13,117. Have your customers the power of getting access to tables and satisfying themselves that they are not charged more than other parties?—No; we publish in our stations the tolls authorized by Act of Parliament, but we do not publish the rates.

13,118. (*Capt. Galton.*) The Act of Parliament provides that you are to carry people at equal charges under similar circumstances, does it not?—Yes.

13,119. And therefore would not it be fair and just that any person should have a right to see what rates you were giving to other parties?—Of course if they come and ask us what our rates are we tell them; but I do not see any other way of their knowing them except by making inquiry; for if we were to publish constantly at our stations the rates for the moment in operation I do not know how that would have to be done, for we are constantly altering the rates from circumstances which we cannot resist, and every day there would have to be an alteration in the table.

13,120. But should you give to any person who applied information as to what the rates were upon any article?—Yes.

13,121. What the rates were, that you were charging to every one?—Yes, as a rule we do charge the same rate under the same circumstances.

13,122. But you do make special exceptions, do you not?—Very seldom.

13,123. Still you do make them?—Very seldom indeed. Occasionally there may be a reduction in rate for very large quantities.

13,124. How would other people be aware of the allowance that you make for those very large quantities?—It would not be for the standard trade, it must be for some exceptional case, a contract for instance.

13,125. But you are bound to carry for all persons alike under similar circumstances, and if another person happen to be able to send the same quantity as the man to whom you have given the favourable rate gets, such person would be clearly entitled to the same rate, would he not?—No doubt.

13,126. How would he become aware of this other rate?—Take the case of building a bridge or a viaduct on some part of our line; we advertise for tenders for the erection, and the stone is to be conveyed from some part of our line to the place where the bridge is to be erected; in that case we make a special rate, but all the parties tendering come to us to ask what the rate is, and we invariably adopt the same rates under the same circumstances.

13,127. But if any other person wanted to send a similar amount of stone to the same part of the line, assuming that it was close to a station, would you give him the same rate?—If it was not for this viaduct that I am supposing, then I should say that we should give him the ordinary rate that we should give to all other persons.

13,128. Then you would not be giving to the two the same rate under the same circumstances, supposing the amount of stone was exactly the same, going between the two stations, the only difference being that one was to be for one purpose and another for another?—Of course I consider that the circumstance in this case is the building of the viaduct, and if I give everybody who desires to build it the opportunity of having their stone conveyed at the same rate, I have not done any harm or any wrong to another man in another trade altogether; because in the case of the other man in the neighbourhood who may not be a mile from the viaduct, and who may require stone for another purpose, I should give to him and to all the public desiring to have the stone for the same purpose the same rate.

13,129. Then do you consider that it is necessary that the public should know what the special rates are that you are giving?—I do not think it is in those circumstances.

13,130. (*Sir R. Hill.*) In the last paragraph of the paper which you have put in you state, as a reason for not publishing the rates and fares that you have about 2,000,000 rates. Can you explain to the Commission why the number should be so very great?—First of all we have 200 stations on our line, and the rates upon our line alone are very numerous. We have five classes of rates,—1st, 2nd, 3rd, 4th, and 5th class, specials, goods, minerals, and then smalls. I have had it carefully got out to see what the rates are, and they come to very nearly 2,000,000 rates and that is irrespective of passenger fares altogether. If you add the passenger fares to them I do not know what the number would be, but I suppose it would be somewhere near another 1,000,000 rates.

13,131. (*Capt. Galton.*) Do you see any objection to publishing at each station what the passenger fares are between every station on your line?—I do not see the necessity of it; the same objection applies to that as it does to the publication of goods rates.

13,132. But are you not aware that in many London stations it is done?—I am not aware of that.

13,133. The London and South-western Company publish all their passenger fares between every station on their line in their booking office in London, do they not?—I am not aware of that.

13,134. (*Sir R. Hill.*) For the sake of simplicity would not it be advisable to reduce this large number of rates?—The tendency is rather to increase them; each of the companies, our neighbours, desires to have through bookings with us, and lately we have very greatly increased the number. Within these last few years we have established through rates with the Midland, the Manchester, Sheffield, and Lincolnshire, and the Great Northern companies, very much more ex-

J. Smithells, Esq.

23 Feb. 1866.

tensively than we had had before, and we are constantly increasing them.

13,135. Supposing that the table of rates were confined to your own line of railway, would not it be advisable as a matter of convenience to your own servants that the variety of rates should be reduced considerably ?—We cannot do so; it might be convenient and we should like it; the less rates we have the less trouble we have, but we find that the public necessity is such as to demand it; we must make those rates and the tendency, as I before stated, is to increase the number rather than to decrease them.

13,136. In consequence of the demands of the public ?—Yes; through the neighbouring companies.

13,137. Confining your attention to your charges upon your own railway, and not speaking of the charges which combine those of the neighbouring lines, might it not be advantageous to yourselves to reduce the variety of rates, and make some approximation to uniformity of rate ?—I think not decidedly. We have now no more rates than are absolutely necessary on our own line for the convenience of the public.

13,138. (*Chairman.*) When you are speaking of rates in your last answer you do not mean mileage rates but the total rates between different places ?—Yes; that is what I understand. I mean the total number of rates.

13,139. (*Capt. Galton.*) So long as railways are worked upon the present commercial principle it is perfectly impossible, I presume, to avoid having a large number of mileage rates ?—Certainly; you must have the ordinary class of rates on whatever principle you work.

13,140. If a railway was worked on a uniform mileage-rate principle, then, of course, the rates would be perfectly similar, would they not ?—It is not a uniform rate; you must have regard to the different articles to be carried. One man requires furniture to be carried, and another man requires boards to be carried.

13,141. But still those are classified in a certain number of classes, and if you had a uniform class rate you would then be able to say that class 1 was carried at such and such a rate per mile, class 2 at such and such a rate, and classes 3, 4, 5, 6, and 7 at separate rates. Therefore, there would be, at all events, comparative simplicity in that case ?—If you adopted the uniform mileage principle, it would be a very simple matter indeed, but it would be very wrong to the companies and, I think, prejudicial to the interests of the public, as I have before stated.

13,142. What I refer to is that under the present system of working, you must have this very large number of special rates ?—Yes; and they will become larger and larger, I think, every year, because you must have classes 1, 2, 3, 4, and 5, according to the value and character of the article; and even then you would want a very large number of rates.

13,143. You would want similar rates to those which you have for passengers, I presume ?—Yes, of course. I do not know what classes you would suggest goods being divided into; we now divide them into five, and from practical experience we say that that is a proper division; and then we have the special class and minerals in addition.

13,144. (*Chairman.*) Is there a uniformity of charge for goods in the same class, that is to say, are they always charged uniformly between any two points ?—Yes; that is the object of classification, and generally it is adopted.

13,145. But there are exceptions, I presume ?—Yes, sometimes; then frequently an article is withdrawn from a class and made into an exception.

13,146. (*Earl of Belmore.*) If you had a uniform mileage rate you would probably be obliged to have a great many more classes, would you not, because, although you may be able now possibly to keep certain goods of different sorts in a class, because you have arranged your mileage rate according to what it will bear to have put upon that class, yet you will find that eventually, in order to do yourself justice, you will want a great number of classes ?—You must have a large number of classes undoubtedly, especially if it were to be a permanent arrangement, but I say that you cannot make a permanent classification. We find in practice that we have to alter the classification constantly, and there are different classifications in existence in various parts of the country. On our own system the classification which applies to the Humber traffic is altogether different from the classification which applies to our local traffic.

13,147. (*Capt. Galton.*) Why is that ?—Because in dealing with the transit traffic across the country it must be carried at very low rates.

13,148. What sort of goods would be put in a different class ?—Cotton, for instance, is carried at a very low rate; and flax, and so on, we carry at a very low rate, and we make a special classification also as between, I think, the West Riding towns and London. Where there is an active sea competition the classification is necessarily disturbed if you are to have any traffic at all.

13,149. What class is cotton put in in your local traffic, and what class is it put in in your Humber traffic ?—We class the Humber traffic A. B., C., D., and so on under the alphabet. I do not know what class cotton is, but it is altogether different from the clearing house classification, and is specially applicable to the Humber traffic.

13,150. (*Chairman.*) Have you any complaints from your customers with respect to your charges for terminals ?—No.

13,151. In making a rate between two places you do not inform them what is for terminals and what is for carriage from station to station ?—No, we do not.

13,152. Do you think that there would be any objection to the terminals being fixed by Act of Parliament ?—I do. The circumstances vary. As I have before stated, in answer to the Liverpool witnesses, the cost at one place is very much in excess of the cost at another.

13,153. (*Capt. Galton.*) But circumstances vary with regard to tolls, and yet you have a toll fixed by Act of Parliament which you cannot exceed; why, therefore, should not you equally have a maximum terminal fixed by Act of Parliament ?—Of course, if the maximum terminal is fixed at an amount which will compensate us then there would not be very much objection to it. The question was raised before the chairmen of committees some years ago I recollect, and there was a proposition then made to have a maximum terminal, but it was not carried out. I think mainly in consequence of the coal owners, who opposed the arrangement.

13,154. You can charge now anything that you think reasonable ?—Yes, a reasonable sum. Of course there is the court to appeal to if we are not reasonable.

13,155. Would it not be very difficult for the court to be able to say that any charge which you made was not a reasonable charge ?—I do not see the difficulty; the court would have no great difficulty.

13,156. It would be a very expensive process, would it not, for any party to appeal to the court of law ?—I should think not.

13,157. It is not one of those questions which might be settled in the county court, is it ?—I think that they might try the case in the county court; they might take one consignment and try the case upon that.

13,158. (*Sir R. Hill.*) Have your customers the means of knowing, when you demand a certain sum for the conveyance of goods, how much of that sum is for terminal charges and how much for mileage rate ?—No, they have not.

13,159. (*Capt. Galton.*) Then would not it be very difficult to bring the question into a court of law ?—They would begin with the distance between the points between which we carry, and would apply to that the rate authorized by Act of Parliament, and then they would go into the question of what was a reasonable charge for the service which we performed at the stations. I take it that a reasonable sum would be very easily arrived at before the county court.

13,160. (*Sir R. Hill.*) That is to say they would consider the mileage proportion as made up of the maximum rate which you are entitled to charge as a mileage rate ?—That would be the plan which they would adopt I suppose.

13,161. In point of fact you do not charge the maximum mileage rate, do you ?—No, we do not.

13,162. Then how are your customers to learn how much of a certain charge is for mileage and how much for terminal expenses ?—It is impossible for them to do so. The fact is, that we fix the rate with reference to the requirements of the traffic, not distinguishing in so fixing it what portion is for terminal, and what portion is for mileage rate, taking care that the total rate which we charge is within the powers which Parliament has conferred upon us, and we are guided in that case as in all other cases by commercial considerations and what the value of the article may be.

13,163. (*Chairman.*) You do not consider that the collection and delivery comes within the denomination of terminal, do you ?—Not the carting.

13,164. Not in any case ?—No, not within the Act of Parliament. The "reasonable sum" applies to the station service.

13,165. (*Capt. Galton.*) What is your definition of "terminal ?" what would it actually include ?—My definition of "terminal" of course would include the porters' labour and shunting.

13,166. Would it include putting the goods into a siding ?—It would include shunting at the station and marshalling the trains.

13,167. Putting the goods into a siding or taking them out of the siding ?—It would include the loading and the service incidental to that loading.

13,168. I should like to understand what those services are which it would include ; would it include the porters putting the goods on the trucks ?—Yes.

13,169. What else ? — It includes what is mentioned in the Act of Parliament. The Act says, with respect to the conveyance of goods, "The "maximum rate of charge to be made by the "Lancashire and Yorkshire Railway Company for "the conveyance thereof along the said railways, "including the tolls for the use of the railways "and waggons or trucks and locomotive power "and every expense incidental to such conveyance, "except a reasonable sum for loading, covering, and "unloading of goods, and for delivering and collec-"tion and any other services incidental to the "business or duty of a carrier."

13,170. Covering would be putting tarpaulings upon the goods ; there would be a charge for that, would there ?—Yes.

13,171. And for warehousing ? — Yes, and for warehousing also ; that is included in covering.

13,172. You mentioned shunting just now, how is that incidental to loading ?—We have at Liverpool, I suppose, 10 or 11 miles of sidings near to the terminal station. We shunt all the waggons there, and we consider that a station service.

13,173. Upon the traffic upon which you charge your maximum rates, we will say the Burnley traffic, what terminals do you put ?—In fixing the rate it would of course depend upon the class.

13,174. Take the first class ; you stated, I think, that you charged your maximum rates from Burnley ? —I cannot say that the rates from Burnley are precisely our maximum rates, but they are pretty near it.

13,175. In a case in which you charge your maximum rates, what sum do you add to that amount for this terminal accommodation which you are speaking of at Liverpool ?—Supposing it was first class, I think the terminal there would be about 3*s.* at each end.

13,176. That would have to be added to the maximum rate ?—Yes.

13,177. What would it be for a higher class than that ?—Of course a higher class would be rather higher, 3*s.* 6*d.* at each end.

13,178. Then you do not adopt the clearing house rate of terminals at all ?—No, not in fixing the local rates. The clearing house terminal is an arrangement between the companies for mutual convenience and has no reference to the actual amount which we are empowered to charge to the public.

13,179. Then upon your local goods you charge something extra, I suppose ?—Yes ; in the terminal at Burnley we should include the collection in that case.

13,180. You would include the collection at Burnley and the delivery at Liverpool, would you ?—No.

13,181. What charge do you make at Liverpool for that delivery ?—Of course the charge there for carting varies. We contract for 1*s.* 3*d.* to 2*s.*, and we make that same charge to the public.

13,182. (*Chairman.*) Do you consider that the interest on the capital expended on sidings and rails and sleepers and on the land, and also the maintenance of that part of the permanent way ought to be covered by the terminal charges ?—Yes, I do.

13,183. (*Capt. Galton.*) In fact, you consider that all the cost of providing stations and station accommodation should be defrayed out of the terminal charge that you make ?—Yes. I consider that you are entitled, in fixing the terminals, to claim interest upon the capital which you have expended in providing station accommodation.

13,184. Then if that is so the public might be called upon to pay something enormously high in addition to the mileage charge, supposing there were no competition to prevent your fixing a high rate ?—If we attempted to exact a high terminal, higher than that which we are entitled to do, that would become matter for proof ; and we should have to show what we had spent at the station in constructing it, and what we had spent in conducting the business of the station ; and that would form the terminal charge.

13,185. You assume that the words of the Act of Parliament, "a reasonable sum for loading, unloading, and covering the goods," gives you that power ?—I do.

13,186. (*Chairman.*) Have you a large amount of excursion traffic on your line ?—We have.

13,187. Are you favourable to encouraging excursion traffic ?—Yes, I think it answers our purpose very well. We have an immense traffic. Still it is a question whether we should be better if we confined it to ordinary third-class trains ; but it is so large a traffic that we do not like to interfere with the principle which has been observed for many years past of encouraging it as much as we can. We have a very large excursion traffic in Whitsun week particularly. I have got a return for 1865 in Whitsun week, which shows that we carried a total number of 653,000 persons in the week in our district. Of course we carried them at very low rates, and we think that it answers our purpose.

13,188. Do not the excursion trains often interfere with the ordinary passenger service ?—Not very much.

13,189. Do you not find that your ordinary trains are more unpunctual when the excursion trains are working ?—Occasionally they are.

13,190. (*Sir R. Hill.*) I suppose you issue return tickets largely ?—Yes.

13,191. To third-class passengers ?—No, not to third-class passengers, not very many ; to some few places we do, but not to many.

13,192. I presume that you do your best to prevent the transfer of those tickets on the completion of the journey in one direction ?—Yes, but it is very difficult to prevent it.

13,193. Do you think that in point of fact the transfer is prevented ?—No, I do not think it is prevented. I do not see how you can prevent it ; it is impossible.

13,194. Might it not be better to abolish return tickets, and to charge a less sum for the single excursion ?—I think not. Return tickets are a great convenience to the public who are constantly travelling, and then an occasional passenger pays the ordinary fare.

J. Smithells, Esq.

23 Feb. 1866.

13,195. But supposing the ordinary fare were reduced so that your receipt for a given number of passengers should be made the same as it now is, might not that be an improvement?—I think not. I think that a reasonable return ticket for a tradesman who has to travel very frequently is a great convenience, and that an occasional passenger is very well served by paying the ordinary fare.

13,196. (*Capt. Galton.*) One great convenience of return tickets is that a man has not the trouble of getting a ticket at the booking office a second time?—Yes, that is a very great convenience indeed.

13,197. (*Earl of Belmore.*) Do you give return tickets extending over more than one night?—Yes, to the sea side at the end of the week. A person living in Manchester for instance being an apprentice or being engaged in business and going to Bury or other towns, can take a return ticket on the Saturday and use it on the Monday for coming back.

13,198. Putting Sunday out of the question, would you give return tickets from Monday to Wednesday under any circumstances?—Yes, on some parts of our line.

13,199. (*Sir R. Hill.*) Supposing that the restriction as to the transfer of return tickets were abolished, do you think it would make any material difference to you?—I do not see how we can possibly prevent them being transferred, because we do not notice the persons who take the tickets.

13,200. Then is not that a reason for not attempting to restrict the transfer?—I do not think you can restrict it. Of course if we see that they are improperly used and we detect it we complain, but practically we cannot prevent it.

13,201. But by forbidding the transfer you induce people to commit what railway companies consider a fraud, might it not therefore be better for all parties to allow the transfer?—Practically I do not know that that would be a very great injury to the companies because after all the great majority of the people who take return tickets do use them.

13,202. Then you do not see much objection to allowing the transfer of return tickets?—I think that the person who takes it ought not to do it; but there is no very great injury inflicted upon the company.

13,203. He ought not to do it because there is an understanding that he shall not do it?—Certainly.

13,204. But if the regulations of the company allowed of the transfer of return tickets then a person would be guilty of no impropriety in transferring his ticket and would not it come to the same in the end?—Of course.

13,205. (*Capt. Galton.*) Would not this at least be probable that all people who travelled would take return tickets in order to sell them at the end of the journey?—I scarcely think so. Of course they would only do that by establishing a market or depôt where they could have the sale, and we should at once discover that, and put a stop to it. I think that there ought to be a restriction upon selling them publicly.

13,206. (*Sir R. Hill.*) But you admit that you cannot enforce the restriction?—No, but still there is no attempt on the part of the public to carry on a wholesale business in selling return tickets.

13,207. Because, as I understand you, most people who take return tickets do return?—Yes, the great majority of them no doubt do.

13,208. (*Capt Galton.*) Do you run third-class carriages by most of your trains?—Morning and evening, and to some places more frequently.

13,209. Is that an increasing traffic on your line?—Yes, it is a very large third-class traffic.

13,210. Is the second-class traffic a diminishing traffic?—No; I think it is increasing too.

13,211. Would additional facilities given to the third-class develop a larger amount of traffic?—I think we give facilities to the third-class traffic equal to its requirements, and I scarcely expect that we should very much increase that traffic if we offered greater facilities.

13,212. What is the objection to giving return tickets to third-class traffic?—The fare that we charge is a very reasonable one.

13,213. What is it?—A penny a mile.

13,214. (*Chairman.*) Have you in no case fares under 1*d.* a mile?—Yes, in some cases we have lower fares, very considerably lower.

13,215. (*Mr. Gower.*) Have you any competition with omnibuses?—Yes, a little; between Bury and Manchester, for instance, the omnibuses run.

13,216. (*Earl of Belmore.*) Do you think that if you were to reduce the price of your tickets generally to any great extent you would stimulate your passenger traffic so far as to recoup you what you might primarily lose?—I am very much afraid that we should not. We are trying the experiment now between Bury and Manchester, and between Manchester and Rochdale, but so far the experiment does not show us that we shall gain by it.

13,217. (*Sir R. Hill.*) How long is it since you began the experiment?—From Bury, I think, 18 months; but from Rochdale not so long. The figures, so far as we have gone into them, show that we do not gain anything.

13,218. (*Capt. Galton.*) Do you lose by it?—I think that when we come to calculate our expenses we shall lose.

13,219. Has the traffic increased much?—A little; but then it has disarranged the traffic.

13,220. (*Sir R. Hill.*) Can you state to the Commission what the amount of the new fares is?—It is, when we have put on special third-class trains we run for 6*d.* a single journey and 9*d.* a return ticket, whereas the single ordinary fare before was 10*d.*

13,221. (*Capt. Galton.*) Do you charge that only by the special trains?—Yes, between those places only, and only by those trains.

13,222. It is scarcely a fair trial, is it, if you do not adopt it with all the trains?—It is an indication, I think, of what we may expect, but it is in a very crude state at present. I should be very glad to supply the Commission with full information if we had the materials of a definite character wherewith to do it, but we have not, we scarcely know ourselves what the result will be, but the present impression is that it does not answer.

13,223. As you have only tried the experiment with a limited number of trains, and not with all trains, the experiment, even if is proved not successful, would scarcely be considered a fair one?—Of course it is not like trying the whole of the railway.

13,224. I am not assuming that you are trying the whole of the railway, but I am assuming that that experiment between those two places is only tried with respect to certain trains in the day; there are other trains in the day, are there not, on which you charge high fares?—Yes, between those particular places, no doubt.

13,225. Therefore, I say, the experiment is not a fair one unless you have tried it with all the trains between those two places?—Even then, supposing that all trains between any two points are cheap trains, and that the principle is applied to all trains, still in the case of Bury, Bury is on the main line of the company to Manchester, and passengers get out of the main line trains at Bury and get into the cheap trains, and so go to swell the number of people travelling by the cheap trains, and that has a tendency to mislead us in our calculation.

13,226. You would not allow them, would you, to re-book and to go on by the same train at the cheap rate?—No, it is not quite so, but the trains are so frequent that a passenger waiting a few minutes can catch a train to Manchester, and then he goes as an ordinary 3rd class passenger. The difficulty is to ascertain the actual increase. I believe that in the town of Bury a number of people have been induced to get out of main line trains at Bury mainly through that difference, and to join the cheap train there.

13,227. (*Sir R. Hill.*) You stated that the average distance travelled by your passengers is 10 miles, and the average fare 9*d.*?—Yes.

13,228. Does that include the return ticket passenger and the excursion train passenger ?—Yes, the whole of them.

13,229. It would seem from that that your fares are unusually low, would it not ?—They are very low.

13,230. You have approached the present low system of fares gradually, I presume ?—Yes; the tendency has been rather to reduce them than to increase them; but, of course, as I before stated, many of the fares are good paying fares, and something like the powers that we have, but the low average arises from the fact that we carry an immense number of people between our local stations for very short distances, and so that reduces the average.

13,231. But you have from time to time made such arrangements as have reduced the average charge ?—Yes, the tendency is to reduce, no doubt.

13,232. I presume that you have not pursued that course without ascertaining, from time to time, whether the previous reductions have been profitable or otherwise ?—Yes, the reductions are gradually made; they are not periodically made in one general change. We keep altering the fares as necessity appears to require, and not at fixed times in the year. They are gradually being changed, and that gradual change has had the effect of lowering the average, no doubt.

13,233. Hitherto, I presume, you have been satisfied with the financial result of those reductions ?—Yes, we have been satisfied; we have accepted the result.

13,234. Are we to understand that all the experiments which you have hitherto tried in the way of reduction, with the exception of the one which is still under trial, have been successful ?—Yes, they have been successful; but then, of course, we have made no special reduction, the general tendency has been to reduce, as shown by the average of our receipts.

13,235. And we may hope that you have had no reason to repent of this reduction ?—No, we have not repented of it.

13,236. (*Earl of Belmore.*) What do you think would be the effect if you tried the experiment of a low scale such as some witnesses have suggested, namely, reduce all your fares as much as 50 per cent.?—That would simply take away our dividend. We, of course as I before stated, do charge full fares between many places, and get good paying fares, others are very low, and in each case we adapt the fares to the circumstances.

13,237. You do not think that if that were done the traffic would be so stimulated as in any reasonable time, to recoup you what you lost in the amount of the fare ?—No, I do not think we should be compensated for such a reduction as that by the increased traffic.

13,238. (*Sir R. Hill.*) Can you go back 20 years, and give the Commission an idea of what the actual reduction has been in your fares during that period, that is to say, how the present fares would as a whole compare with the fares 20 years ago ?—I cannot give you that.

13,239. Is it not possible that you may have reduced your fares even as much as 50 per cent.?—No. I can give you from 1860 to 1865. In 1860 it was 10*d.*, the distance travelled was 10·17 miles, and the receipts were 10·3*d.* per passenger. In 1865 the distance was 9·92 miles, and the receipts were 9·3$\frac{3}{5}$*d.* So that the distance has lessened correspondingly with the reduction in the receipts.

13,240. (*Capt. Galton.*) Practically you have not made very large reductions except in special cases ?—In the case of Rochdale we have lowered the fares to Liverpool and to other places from Rochdale. If persons come and represent that they desire the fares to be altered, we look through them and, if we find any necessity, to alter them, we do it. Generally the tendency is to meet the public wishes by reducing and not by increasing.

13,241. (*Chairman.*) I observe that you state that when the dividend of your company averages 8 per cent. for three years, your tolls and fares are subject to revision by the Board of Trade. Is that provision likely to come into operation ?—I hope it will.

13,242. Would that provision prevent your Company dividing more than 8 per cent. ?—I think so.

13,243. I mean would it have the effect of discouraging your company from dividing more than 8 per cent.; should you be afraid of going before the Board of Trade ?—We should not be afraid of going before the Board of Trade. According to the Act of Parliament, if we divide 8 per cent. for three years we may be called before the Board of Trade, and we shall have to submit.

13,244. Would this provision have the effect of preventing you dividing more than that ?—Yes, I think so.

13,245. (*Capt. Galton.*) You would evade it by some means ?—Of course it would be very natural to keep the line in as efficient a state as possible in maintaining it, but we should not throw our money away.

13,246. You might get rid of your mortgage debt in that way perhaps ?—Of course, but I have not considered the question as to how we could evade the Act of Parliament.

13,247. I mean that it could be evaded easily, that it is no real security ?—It must be a security; the shareholders cannot have more than 8 per cent.

13,248. But could not they, under their Act of Parliament, convert their mortgage debt into shares ?—They might do so, no doubt.

13,249. So as to increase their capital and allot it amongst the shareholders ?—No doubt.

13,250. The Act of Parliament allows that, I think ?—I am not sure whether we should have that power; but I think we have.

13,251. (*Sir R. Hill.*) What was your last year's dividend ?—Our last year's dividend for the whole year was 5*l.* 17*s.* 6*d.*

13,252. Then you are a long way from the maximum per-centage ?—Yes; but if trade revives in our district we hope to get it sometime. No doubt as we increase in prosperity we shall be better able to serve the public, and we shall be able to give greater facilities and advantages than they now enjoy.

13,253. (*Chairman.*) Are there any other points upon which you could furnish the Commission with any information ?—Not that I am aware of.

The witness withdrew.

Adjourned to Tuesday next at 12 o'clock.

Tuesday, 27th February 1866.

PRESENT:

The Right Hon. The Earl of Belmore.
The Right Hon. Lord Stanley, M.P., F.R.S.
The Hon. E. F. Leveson Gower, M.P.
Sir Rowland Hill, K.C.B., F.R.S.
T. B. Horsfall, Esq., M. P.
Robert Dalglish, Esq. M.P.
Geo. Carr Glyn, Esq., M.P.
Capt. Douglas Galton, R.E., C.B., F.R.S.
E. T. Hamilton, Esq., M.P.
William Pole, Esq., F.R.S., *Secretary.*

His Grace THE DUKE OF DEVONSHIRE, K.G., F.R.S., in the Chair.

J. Grierson, Esq.

27 Feb. 1866.

James Grierson, Esq., further examined.

13,254. (*Chairman.*) Do you propose to put in the printed paper headed "General Observations" as a statement, or do you wish it to serve only as a guide to the Commissioners in putting questions to you?—As your Grace pleases.

13,255. Then I will take it paragraph by paragraph. Will you be so good as to favour the Commission with your opinions as to charging an uniform rate per mile?—I should state that the remarks in the printed paper have been made in consequence of the evidence which has been brought before the Commission, which I have seen, where some of the witnesses recommend a uniform rate first upon each particular railway, and other witnesses urging that there should be an uniform rate throughout the country, and I will read the observations to which your Grace's question refers: "If this company were compelled to charge an uniform "rate per ton per mile, it would practically have the "same effect as making it compulsory upon all the "companies in the country to charge an uniform rate, "unless they ceased to compete with each other; thus, "if the Great Western charged a particular rate, say "2*d.* per ton per mile, between Basingstoke and Lon-"don, the South-western, who have also a railway be-"tween those places, would have to charge the same "rate. And the same charge being applicable over "the whole Great Western system in like manner, the "London and North-western Company, competing "with the Great Western, for instance, between Leam-"ington, Birmingham, Shrewsbury, and Chester, would "have to adopt the same rate; and the Midland and "Great Northern competing with the London and "North-western, would be compelled to do the same "until that rate became universal over the whole "country."

13,256. You state that the South-western Company and the Great Western Company would have to charge the same rate to Basingstoke, do you mean the same gross rate?—Yes.

13,257. It would be an unequal mileage rate?—Yes; in that case it would, because there is a difference of three miles between us, but there are many cases where, the distance being the same, it would effect the same result.

13,258. But there are many cases where the distance is unequal as between the two lines, and where there would be the same gross rate, but an unequal mileage rate?—Yes; but I have no doubt that the proposal would bring about the same result, and that there would be an uniform rate upon every railway all over the country.

13,259. Would not the result be, either that the rates would fall into inextricable confusion, or that competition must be given up?—Yes, that is what I say, that competition would have to be given up, or the rate would be uniform in the end, although perhaps the proposers do not intend to go so far as to make it compulsory.

13,260. (*Capt. Galton.*) If you charged an uniform mileage rate, and all other companies did the same, it would follow of necessity that in some cases, as between London and Windsor, the South-western Company must charge a different fare from Windsor to London than the Great Western Company?—Yes; if their rates must be per mile, and then, as the chairman has said, competition would cease.

13,261. People must then select their route, and pay either a higher fare or a lower fare?—Yes.

13,262. As is the case at the present time between London and Paris?—Yes, quite so.

13,263. By the Boulogne route the fares are lower than by the Calais route, because the distance is greater?—Yes, at all events by Dieppe it is so. I do not think it is so *viâ* Calais and Boulogne, the fares I think are the same.

13,264. (*Mr. Horsfall.*) If the mileage rate were uniform travellers would naturally select the shortest route?—Yes. If goods were charged at per ton per mile between London and Birmingham, there would be no competition between the Great Western Company and the North-western.

13,265. The whole of the goods would go by the shortest route?—Yes; and it is evident that that is not the desire of the public, because they divide their traffic, although the rates are now equal.

13,266. (*Lord Stanley.*) If the same company had two lines, one a little longer and the other a little shorter, between the same points, it would not be in their power to use the longer line as a relief line to the shorter line?—No; if the rate were per ton per mile.

13,267. Even if they were willing to carry on the longer line at the same price as on the shorter, it would not be allowed by law?—No, it would not. The next point is a suggestion made by some of the witnesses that there should be an uniform rate all over the country, with respect to which I say, "An uniform rate through-"out the country, whether brought about in this "manner or by a parliamentary enactment that all "charges were to be uniform per mile, would act very "prejudicially to trade in various ways, unless it were "made in many cases unnecessarily low, whereby the "railway companies would suffer serious loss. For "instance, the rate which might be reasonable for the "conveyance of iron from Wolverhampton to Basing-"stoke for the small consumption of the latter place, "would be a very heavy burthen upon the iron trade "between Wolverhampton and London for consumption "there against iron imported by sea, and it would "especially tend to put a stop to export traffic between, "for instance, South Staffordshire and London or "Liverpool, as against Middlesboro' and the South "Wales iron districts, situated close to the sea. It "would likewise give to any town or port, particularly "those which are favourably situated, such as Liver-"pool, for the American trade, or any manufacturing "town or district where the cost of production is low, "a practical monopoly of the supply of all the adjacent "country, and in many cases a system of uniform "milcage rates would entirely shut up trade and "manufacture. For instance, at Westbury and Seend, "in Wiltshire, there is an extensive deposit of iron "ore, containing only about 30 per cent. of iron; but "no coal has been found in the neighbourhood suitable "for smelting it, and therefore the Great Western "Company have given low rates for the conveyance "of coal from South Wales, and for coke from Bristol "to those places for smelting purposes, and as these "places are about 160 miles from South Staffordshire, "they have also given low rates for the conveyance "of pig iron to that district for the purpose of manu-"facture. If the Great Western Company were re-"quired to charge an uniform rate, they would not "adopt the rates given to Westbury and Seend "universally over their line, but in their own interest "would be compelled to charge the rates obtained in "districts more favourably situated, and the conse-"quence would be that the ironworks in Wiltshire

" would be shut up. It is more profitable at fair rates " for the railway company and more beneficial to the " public to carry for a long distance at a comparatively " low rate than it is to carry for a short distance, and " this advantage both parties would lose with an " uniform rate of charge. In the cases of railways " competing with the sea, as the Great Western Com- " pany do between places in South Wales and London, " and of the carriage of import or export goods at " reduced rates, as between Liverpool and London, " the competition in the one case and the accommo- " dation to the trade of the respective ports in the " other would to a great extent cease."

"Again the Great Western Company convey emi- " grants and other passengers from London to Fal- " mouth at reduced fares, in order to induce them " to join their ships at the latter place instead of in " London, but that inducement would have to be " withdrawn. One witness suggests that the passenger " fares over a line, such as the Carmarthen and Car- " digan railway, where the population over the whole " distance within three miles of the line is probably " not above 20,000 persons, should be as low as those " on the North London railway, which passes through " a city with a population of between two and three " millions; but the circumstances are so evidently dis- " similar that, unless the metropolitan fares were raised " considerably, the attempt at an uniform scale would " be a source of serious loss to the Carmarthen and " Cardigan, and other similar lines passing through " agricultural districts."

" If, as suggested by one witness, a Government " Board should be at liberty to interfere with the tolls " of a company which had voluntarily reduced any of " them, such interference would discourage a com- " pany from reducing their rates, even where it " would be advantageous to the company and the " public to do so. Upon the whole the suggestion of " an uniform system of mileage rates and fares would, " if acted upon, be most unsuitable to the require- " ments of the trade of this country."

13,268. (*Chairman.*) You have stated that a rate which might be reasonable for the conveyance of iron from Wolverhampton to Basingstoke, where the consumption is small, would be a very heavy burthen upon the iron trade between Wolverhampton and London. Where the consumption is small do you consider it fair for the railway company to charge a higher rate?—Yes, and we do.

13,269. Upon what grounds do you consider that the persons living in towns where the consumption is small should be charged more?—For this reason: take, for example, London—iron is required in large quantities, but for the purposes of Basingstoke probably a couple of hundred tons of iron in a year is all that would be consumed, but in London the trade requires probably 100,000 tons in a year, and we consider, therefore, that there is such a difference of circumstances that it is only reasonable to charge, say, even our maximum rates to Basingstoke; but if we attempted to do that to London it would have the effect of throwing the supply of the bulk of the trade from districts such as South Wales and Middlesboro', as there would be competition by sea.

13,270. Is it then mainly on the ground that there is competition by sea between Wolverhampton and London?—No, that is not the main reason. I contend that in agricultural districts it is not at all necessary to charge the same low rates for the quantity of iron that is consumed there as it is for large towns. Take, for instance, iron coming to Wolverhampton from Shropshire, or from North Wales, smelted at those places, for manufacture in Staffordshire, I hold that that is a very different case, and one in which we ought to give much lower rates than for the conveyance of small quantities to a country foundry.

13,271. (*Mr. Glyn.*) The quantity conveyed is also taken into consideration?—Yes; we take into consideration the quantity conveyed. Take for instance a small foundry at Oxford, the quantity of iron consumed there may be 300 tons in a year, and if we charged half the rates that we charge now it is probable that it would not increase the quantity carried in a year 50 tons. If we charged as high rates from North Wales or South Wales, or from the Westbury Works, which have been mentioned, to Wolverhampton, it would have a very prejudicial effect upon the manufactures of that place.

13,272. (*Mr. Horsfall.*) If you charged those lower rates in agricultural districts would it not enable them to develop their resources, and bring an increased trade to the railway which would ultimately pay the company?—Shall I take the article of iron?

13,273. Yes.—I think not. I think that the course of trade is very much more to go to large towns where they get the best machinery, and where they construct everything on a large scale and on the best principles, and therefore much cheaper than in small places where they are doing only a small trade.

13,274. You do not think that lower rates in those districts would develop trade, and ultimately pay the railway company better?—Not taking certain trades. In the district that I have spoken of I have no doubt there are cases where agricultural implement makers may start in a very large way, and where it would be desirable to give them a smaller rate for the conveyance of pig iron; but as a rule I do not think we ought to charge as low in the agricultural districts for the carriage of iron as to the large towns.

13,275. (*Mr. Glyn.*) In the case you have given as an instance, a lower rate would not increase the consumption?—Only to a very small extent. Take salt, for instance, going into an agricultural district; I dare say, if we carried it at half the price we do to any of those towns, it would not increase the quantity; and if we charged the same rates as we do for local consumption to London, for shipment, it might stop the trade altogether.

13,276. (*Capt. Galton.*) You are obliged to charge a rate which the traffic will bear, so that the price at which the article will be sold will enable it to compete with an article coming from any other place?—Yes; and that is a great element in fixing the rates.

13,277. (*Chairman.*) Do you, in any cases, charge a different rate for the same article when intended for consumption in the town to which it is sent, and when it is intended for exportation?—We do; and I handed in, the last time I was here, a list of the rates for salt, which shows a case. We charge a higher rate upon articles brought for consumption in London than we do for shipment, and that, in fact, is not an unusual case, that smaller rates are given for traffic for shipment, and lower than the local rates; for instance, from Liverpool to London we give lower rates for traffic that is imported into Liverpool to be brought to London than for the local traffic between the two places.

13,278. (*Capt. Galton.*) Suppose a person is sending exactly the same quantity of salt to be delivered in London that he is sending to be delivered on board ship, you would charge a higher rate for that which was delivered in London?—Yes.

13,279. On what grounds do you consider that that would be right with reference to the Act of Parliament, which says that you must carry at the "same rate under similar circumstances"?—We certainly consider that we have full power to fix any charges within our Act of Parliament, so long as we charge all the parties alike.

13,280. But it would not be charging all parties alike if you sent exactly the same quantity of salt at the same time between the same stations?—I should have added the words "under the same circumstances" also. Then in that case one is for shipment and the other is for local consumption.

13,281. Do you consider that you are entitled to take into consideration the use to which the article is to be applied in saying whether it is carried "under the same circumstances"?—We do.

13,282. (*Lord Stanley.*) Will you be good enough to state upon what grounds?—For this reason, charging the same rate to all alike. First, we will consider that the Act of Parliament enables us to charge a penny per

J. Grierson, Esq.
27 Feb. 1866.

ton per mile, and we say that the traffic will bear that rate, say from Droitwich to London. We therefore say it is a fair rate, and the parties are satisfied with it. Beyond that there may be another trade established if we charge a lower rate, that being a trade in articles not for consumption in London, but for consumption abroad, and the salt merchants and shipowners in London say, If you will give us a reduced rate for the carriage of salt from Droitwich to London it will come to London instead of going to Gloucester; and we consider we are entitled to give and do give a special rate in the interests of London, of the salt manufacturers, and our own.

13,283. (*Mr. Glyn.*) It is a through rate made to the foreign place to which it goes?—It is practically that, although it is charged separately.

13,284. The circumstances of the two cases are not quite similar?—We do not consider them at all similar. We always find that traders, as a rule, desire to have that advantage. The Commissioners have had a few witnesses before them who have pressed upon you the expediency of adopting a uniform rate; and I do not hesitate to say, that for every person of that opinion the effect of a uniform rate would be that you would find 50 persons who would say that it was impolitic in this country.

13,285. (*Earl of Belmore.*) In fact, your opinion is this, that Parliament having given you power to charge certain maximum rates, you have a perfect right to get those rates if you can; and if you find it is necessary to charge lower you have a perfect right to do so?—That is entirely our view; and I should also contend that as a rule, and on the whole, it is found to work very satisfactorily and advantageously to the trade of the country.

13,286. (*Capt. Galton.*) That is your view, subject to the clause which says that you are to charge "equal rates under similar circumstances"?—Certainly.

13,287. (*Chairman.*) Do you convey any considerable number of emigrants and other passengers to Falmouth to join their ships?—Not a very large number, although they are increasing. It is only within the last two years that we have given any special advantages for parties joining their ships at Falmouth.

13,288. Is the passage money lower from Falmouth than from London on board ship?—I am not able to answer that question, but I think they give a through fare from London, and the company owning the vessel pays us our fare. Whether they make a difference between Falmouth and London I do not know.

13,289. (*Capt. Galton.*) Your arrangement is made with the shipping company?—Yes. They take the passengers through from London to Australia at a certain figure, and then they allow the parties to join the ship at Falmouth, and they have the advantage of not having the passengers on board the vessel in clearing out of the Thames, for the first day or two after she sails, and they make a little saving probably in the food that is thereby saved. It is not, I believe, a loss to them, and it is an advantage to the passengers.

13,290. (*Chairman.*) Are your fares the same in agricultural districts, and in thickly-peopled manufacturing districts?—As a rule our fares are the same, but in some districts we attach third-class carriages to most if not to all the trains, for instance, between Birmingham and Wolverhampton, and we therefore give the lower classes an advantage in that respect without reducing our fares.

13,291. You have stated that in such a district as that through which the Carmarthen and Cardigan railway passes, very low fares would be very unprofitable?—I am certain they would. You cannot induce an agricultural population to travel in the same way that you would induce people to travel, having business to attend to, for instance, from Birmingham to Wednesbury, or from Birmingham to Wolverhampton, where they travel as part of their business; in agricultural districts they merely travel occasionally, on pleasure, or on fair and market days, and that is met by giving them market tickets; but I think you could not induce farmers to travel regularly, even if you made the fares one-half of what they are now.

13,292. (*Sir R. Hill.*) Have any experiments been made with low fares in any agricultural districts?—I do not know of any experiments having been tried with that object, but the result of running excursion trains, and also where we have had competition for a time, and where the fares have been very low, has led me to think that you could not induce parties to travel for any long period, or continuously, except in thickly-populated districts.

13,293. You think, from the nature of their occupation, the agricultural population would not be induced to travel, even if the fares were greatly reduced?—Yes. Time is an element in the consideration, and if a man travels between Birmingham and Wolverhampton, suppose that he is a small manufacturer in Wolverhampton, or a shopkeeper there, and that he travels to a large town like Birmingham to buy goods, or for any other purpose, he is then paid in some shape or way, but a farmer, except going to a market town to buy or sell stock, &c., would not be compensated for frequently travelling and for the loss of time and his expenses, and much less so the poorer population in the agricultural districts. I do not see how they would be repaid for their loss of time; and that applies very much to the working classes generally. At Whitsuntide and at Easter we find them coming in very large numbers, but towards the close of the season our trains run comparatively empty.

13,294. (*Lord Stanley.*) Why is that?—Because you cannot induce them to travel above a certain extent. They will spend a certain amount of money in pleasure, but they have little or no occasion to travel on business; and they spend their money generally at certain fixed times—at Whitsuntide or Easter, or other holidays throughout the year. If we charged them very much less than the ordinary excursion fare it would scarcely induce them to travel more frequently.

13,295. (*Capt. Galton.*) You think that if the ordinary fares were all much lower, the working classes would not spread their expenditure over a longer period instead of parting with their money at particular periods of the year?—I do not think they would. I do not mean to say that they would travel at only two periods of the year. All railway companies give them excursion trains throughout the whole season; but, as a rule, we find that the excursion trains towards the end of the season scarcely pay.

13,296. (*Mr. Glyn.*) As I understand you, you would limit the excursion trains very much more than they are at present limited?—In some cases. During the last year, when we looked into this matter pretty closely, we knocked off some of the excursion trains that we had run in the previous year. Some of the excursion trains during that year had not paid for the locomotive power.

13,297. Do you think, generally speaking, that excursion trains interfere with the regular receipts upon a railway?—I am perfectly certain that running excursion trains induces parties to travel by them who really otherwise would and could pay full fares.

13,298. You think that it is the best course to limit excursion trains very much to holiday excursions?—Yes, if it could be done. I remember the very last excursion train that we ran from the north to London for the Exhibition of 1862. By that train we brought up six county families with their servants; of course we cannot prevent them using these trains. I do not think it is desirable to do away with excursion trains, for when we get a good excursion train, it undoubtedly pays the company, because the number of through fares are large, and give a high amount of receipts per mile; but if those low fares were adopted generally, I am certain there would be a serious loss to the railway companies.

13,299. You think it would be more profitable to the railway companies if they limited the excursion trains to particular times of the year?—Yes, if they ran them occasionally throughout the year.

13,300. (*Earl of Belmore.*) With regard to the agricultural population, if the fares for third class passengers were very much reduced, do you think you

would not induce agricultural labourers to travel three or four miles backwards and forwards to their daily work?—No, not in agricultural districts.

13,301. (*Lord Stanley.*) I suppose it is so near a chance whether an agricultural labourer lives near to a station, and whether his work is near to another, that you could not reckon upon any large number?—No; and walking to a station and from a station must form a large portion of the journey by road.

13,302. (*Chairman.*) Do you carry working people from the suburbs four or five miles into a town to their daily work?—No; but this year we are applying for the same clause to be made applicable to a portion of the Great Western and also to the Hammersmith line (which we work), that is upon the Metropolitan, in which case we should carry workmen at a low fare.

13,303. (*Mr. Gower.*) How low a fare per mile?—It would scarcely come out to a mileage proportion, probably 3*d.* a day through the week from the city to Hammersmith and back, the distance being probably seven or eight miles. So far as the railway companies are concerned, if they could see that there would be a very large expansion of traffic by carrying at low fares, they would be happy to reduce, as they have already reduced many of the rates.

13,304. Would something in the nature of season tickets be issued?—They would be like weekly season tickets. We should allow a workman to take a ticket once a week and pay 1*s.* 6*d.* to travel by the workmen's trains morning and evening.

13,305. (*Chairman.*) Then in the "general observations" you state your views as to the publication of rates and fares?—"The publication of tolls under the "old canal Acts, and, as originally intended, in railway "Acts, cannot be compared with the state of circum- "stances actually existing on railways. The publi- "cation of the tolls was, in the case of canals and "roads, and was intended to be in the case of rail- "ways, a protection to the carrier, but it had not "that effect as respects the public who did not use "the canals. The charges of carriers were not con- "trolled by the publication of the tolls; on the "contrary, they charged whatever fares or rates they "could obtain, and the same rates were not charged "by them to all parties alike. In the case of railway "companies, as a rule, so far as witness knows, the "rates are charged uniformly to all alike, varied only "according to what, to the best of their judgment, "they consider the requirements of trade or their "own interest, render necessary, but without intend- "ing to give or having the effect of giving special "advantages to any parties. If the rates were made "uniform and therefore comparatively unchangeable, "there would be considerable expense, but no prac- "tical difficulty in publishing them; but if railway "companies are to be at liberty to fix the charges, "subject to the powers of their Act, it would become "almost an impossibility to publish them in the same "way as the canal and turnpike tolls were posted; "as, for instance, witness will produce a portion of "the rates arranged with neigbouring companies which "have taken nearly two years to complete. The num- "ber of rates and fares in force on the Great Western "Railway is probably about 3,000,000; and under the "arrangements now being made with other railway "companies for through booking, it is quite probable "that the rates and fares in the Great Western books "will amount to 5,000,000."

13,306. You say that you "will produce a portion of "the rates arranged with neighbouring companies "which have taken nearly two years to complete"?—Yes, but unfortunately I have not the books here at present; however, there are four books which show the through rates that we have made with one company alone, and they have been put in force; it has taken two years to make those alone, and although they are now printed, a large portion of them have been altered from various circumstances which required corrections and alterations to be made.

13,307. (*Capt. Galton.*) Although you cannot publish the rates, could you arrange to give access to them to anybody who chose to go and see them?—Of course we have books, which parties might go and look at, but we do practically give them all that they require now: we give them information when they desire it.

13,308. Do you give it to anybody who chooses to ask for it; suppose, for instance, a person who was not a trader on the line, but living in the district, wrote and said, What is your rate from so and so?—Then we give it at once. If any person asks for a rate we quote it; but if any person came and desired to know what our rates were in all parts of the country, and occupied the time of our clerks in that way, we certainly should not do it.

13,309. (*Chairman.*) You would only give him information as to the rates in which he was interested?—We do not know that persons are really interested, but if any one calls at the goods station at Paddington and asks the rate to any place they get it; or, if any person writes to the station, or to the goods manager asking for a rate, he will get an answer.

13,310. (*Mr. Glyn.*) Can they obtain the same information at other stations besides the Paddington station?—Yes, as to a particular station.

13,311. But not generally?—No. Every station has its own rate book; there is a book kept there. The general rate books are kept at Paddington.

13,312. (*Sir R. Hill.*) Should you give, in addition to the ordinary rates, any of the special rates charged to certain individuals?—Do you mean if they came and asked what So-and-so's rate was?

13,313. If a person wanted to know the rate from Paddington to any other place, should you give him, in addition to the ordinary charges, a statement of any lower charges that you might make under special arrangements?—Yes, we should tell him that we would make an arrangement with him under certain circumstances, giving a specified quantity.

13,314. You would say in effect that although you charged usually so-and-so, still, under special circumstances, you charged a lower rate amounting to so-and-so, and you would state the circumstances?—Yes; but I must explain this. We should not do so in all cases; not in every instance, because the number of special rates given are few in proportion to the whole number of rates in force, therefore we should not give that answer always.

13,315. (*Mr. Horsfall.*) Upon what principle do you give special rates?—Take, for instance, between London and Bristol; if one of the sugar refiners there undertakes to send 1,000 tons of sugar at a time, we would give him a lower rate than the ordinary rate upon sugar.

13,316. (*Lord Stanley.*) You reduce the rate upon wholesale transactions?—Yes, upon such a quantity as they would charter a vessel to take round by sea if we did not give them a reduced rate.

13,317. (*Sir R. Hill.*) Should you give the same information to any sugar refiner who applied to you?—Certainly. No favouritism is shown to any particular firm, the object being to get the traffic on to our line, and not caring which firm sends it.

13,318. You would say in effect the ordinary rate is so much per ton, but if you will send sugar in a larger quantity then the rate will be somewhat lower?—Yes. In a case where special rates are given it is a matter of negotiation; our agent in Bristol being in the town, as a matter of course has to see the parties frequently with the view of making these special arrangements, and therefore they are not like parties who are writing simply for a rate in the ordinary way, but they are doing business with us every day, and there is a perfect understanding as to what our arrangements are.

13,319. There is no concealment as to the special rates?—No.

13,320. (*Mr. Horsfall.*) Do you find that this gives any dissatisfaction to the small traders?—I cannot say that the small traders like a special rate being given for a large quantity being carried, they say frequently that if a special rate was not given they might be able to send a large quantity, but they cannot guarantee it. However, it is very seldom that we hear a complaint,

J. Grierson, Esq.

27 Feb. 1866.

although I think it is a very natural objection for the small traders to make.

13,321. I think Mr. Allport stated the other day that they had pursued that plan on the Midland railway at one time, particularly as to the brewers at Burton, but finding that it gave dissatisfaction to the small traders they have now adopted one uniform charge, whether they send a large or a small quantity ?—Yes; of course I am not so conversant with the arrangement as Mr. Allport is, but I know generally this, that they had a secret agreement with one of the brewers, and that the others were excluded from it, so that that case scarcely comes under the category that I have been referring to.

13,322. The principle is the same, is it not ?—No. In that case there was a secret agreement which nobody knew of, except the brewers and the railway company.

13,323. Mr. Allport stated that they now make the same charge to the large brewers as to the small ones ?—Yes, I believe so.

13,324. You do not act upon that principle ?—Yes, we do.

13,325. I thought you stated just now that you made special agreements with a party if he sent you a large quantity, and that he had to pay more if he sent a smaller quantity ?—There are such special arrangements made over every railway, and I have no doubt they are made on the Midland railway. In the case of the Burton trade there was a secret agreement, although they have now thrown the trade open to all the brewers, but that was not the same as the case I have been referring to of the carriage of sugar between London and Bristol. When a sugar merchant buys in London, when there is a supply here and it suits him to purchase, he says to us, If you will give us a reduced rate we will send it by railway, but if not, we will send it round by sea.

13,326. I think Mr. Allport stated that the Midland Company had repudiated the principle which you still retain, of giving a lower rate to a party who sends a larger quantity as a general rule ?—If they have done so I did not know it.

13,327. (*Mr. Dalglish.*) If you make a bargain with a sugar refiner one week for the carriage of 500 tons at a certain low rate, do you allow him to send 20 tons the next week at the same rate, or does he pay the usual rate for the 20 tons ?—Yes, he does.

13,328. He has no advantage unless he sends you a very large load for the train ?—Certainly not. He must send the quantity agreed upon under the stipulations, and then if he sends any lesser quantity at another time, he pays the ordinary rate.

13,329. (*Capt. Galton.*) You said that there was a secret agreement with one of the Burton brewers; what is to prevent a secret agreement being made with a particular trader ?—I do not see anything to prevent it if railway companies choose to do so; but, as a rule, it is never done.

13,330. Would not the publication of the rates prevent that ?—No, not if the companies desired to do it.

13,331. Would any legislative enactment prevent it ?—Of course; then it would be a breach of the law; but I do not think the companies would do it. They have the power to enter into these special agreements; but, as a rule, there are no secret agreements on railways, and the case to which I have referred was a well-known special exception.

13,332. (*Mr. Dalglish.*) Railway companies do not enter into these special agreements for the advantage of the trader, but, I presume, for their own advantage ?—No doubt both; and the probability is that this agreement was entered into in consideration of their sending all their traffic by that particular railway, and upon guaranteeing that there should not be less sent than a certain minimum per annum, the rates should be so much per ton per mile; in fact, I know that it was so.

13,333. (*Sir R. Hill.*) And you see nothing unfair in that arrangement, so long as it is made known to the public ?—Nothing unfair in a special case, when the quantities carried are large, and where there is competition by sea and other circumstances.

13,334. Provided it is known that any one sending an equally large quantity will have the same reduction ?—Yes; provided every one sending under the same circumstances gets the same rate.

13,335. (*Mr. Hamilton.*) In the case of the Burton agreement, other people under the same circumstances could not have got the same rate, could they ?—I am really not able to answer that question. I do not know what the minimum payment was per annum; it might have been so high that none of the small brewers could send so much.

13,336. (*Mr. Glyn.*) It was founded, I presume, on the quantity sent ?—I believe so; but certainly it gave that particular firm an advantage over all the others.

13,337. (*Mr. Hamilton.*) An advantage over other firms who were able, possibly, to send the same quantity ?—It might have been so.

13,338. (*Capt. Galton.*) You do consider that the public are entitled to know what rates are charged in some way or other ?—Certainly; for instance, parties trading from the same places; but I do not consider that we should be required to tell the people in London our rates in Liverpool or in South Wales.

13,339. (*Mr. Horsfall.*) Why not ?—Because we simply give them the rates from London and to London.

13,340. But why should you object to give them both ?—Because we say they are not interested in that question; we fix the rates within our Acts of Parliament.

13,341. Are they not interested in knowing whether you charge less to the London district than to the Liverpool district ?—We certainly do not consider that they are, and that I think is one objection to their having legislative power to come and overhaul our rates. There is no doubt that a large number of persons would consider that it was to their advantage to keep continually examining our books of rates, and raising questions against us. In my own experience I have found that traders and manufacturers, and very respectable people, are quite willing to come to London, and hang about the office for a whole day, and to come month after month, in the hope of getting a special rate, and indeed tiring us out. In fact, if they had the power to come and examine our books, we must, of course, pay some attention to them; and if they could come and bring all the arguments they could think of to bear upon us about this freight and that, and all the rates throughout the country, we could scarcely carry on our business.

13,342. (*Mr. Hamilton.*) Do you never produce your rate book to an inquirer ?—We never show them that.

13,343. (*Capt. Galton.*) Would there be any difficulty in having a set of books which should be accessible to the public ?—No, not any practical difficulty, but I think it would be very objectionable, and I certainly do not see what advantage there would be in it.

13,344. You do not think that the public are entitled to know what the rates are ?—No, not unless you say that the rates are to be uniform. If they are not to be uniform, I do not see upon what principle they can require to see the rates on other parts of the line than that in which they are interested.

13,345. The Act says that you are to carry at equal rates under similar circumstances, and are not the public entitled to see whether you are carrying at equal rates under similar circumstances ?—We do not consider that they are, supposing you mean this, that the Wolverhampton ironmasters are entitled to see what rates we carry at from Swansea to London; they have nothing to do with that; but I must tell you this, that in fixing their rates, the competition they have to meet with in other districts, and also the rates we charge on other parts of the line, are raised by them as a fair ground upon which the rates are to be charged, and we always take that into consideration; but we do not admit their right to have any voice as to the rates charged on other parts of our railway.

13,346. (*Mr. Dalglish.*) In fact, you say that upon one part of the railway where you have no competition

you have a right to charge your maximum rate, and upon another portion where there is great competition you have a right to reduce it to meet that competition ?—Yes, as the traffic will bear these rates.

13,347. (*Capt. Galton.*) You would have no objection to allowing the rates given for any particular district, say from South Staffordshire, to be accessible to the people in that county, and all the rates given in London to be accessible to the people in London ?—I do not go quite so far as to say that we should have no objection to that, but I say that we practically do so now.

13,348. (*Mr. Horsfall.*) You could have no objection to publishing the maximum rate as a protection to the public ?—No, because that is a rate per ton per mile that is to be seen in the Act of Parliament.

13,349. (*Capt. Galton.*) And it is published upon the toll board ?—No, that is only the tolls. There is quite a misunderstanding as to that. These toll boards are merely, as it were, a copy of the old turnpike boards and the old canal boards, but they are practically useless for that purpose, and there is no comparison between publishing all the rates and publishing all the tolls.

13,350. (*Earl of Belmore.*) What is the object of the toll boards ?—It is compulsory upon a company to put them up ; it is in the Act of Parliament.

13,351. Do they profess to show the maximum rates that the company may charge ?—No, only the tolls. It was, as I have said, intended to be a protection to the carriers, but as the railway companies are now carriers and are charging less rates than the carriers used to charge, they are now useless.

13,352. (*Capt. Galton.*) Do you see any objection to publishing the maximum rates authorized by Act of Parliament on your boards ?—None whatever ; it would be simply a copy of the toll board by altering the words "maximum rates" to "tolls," and altering the figures ; but I am certain that it would be of no practical value to the public.

13,353. It would be a protection to the passenger, would it not ?—On the Great Western line we published our own fares at every station until they became so enormous that we had to give it up.

13,354. (*Earl of Belmore.*) You publish the fares at the stations now, do you not ?—Yes ; some of the old fares are published to a small extent. On the Great Western line we book to every station on our line, which perhaps few other large railway companies do, and the fares alone are so numerous that we discontinued our former practice, except as to some of the old ones, which you have probably seen.

13,355. (*Lord Stanley.*) Your objection to a general publication of rates is, first, that it is unnecessary, and next, that the law does not require you to do it ?—Yes.

13,356. Would any inconvenience to the company or to any one else arise from it ?—No practical inconvenience except this, that the parties would pick out any rates that they thought would answer their purpose, and there is no doubt that they would give us great trouble in satisfying them in replying to questions. Persons desirous of obtaining a reduced rate are quite willing to spend a great deal of time to attain their object, and they will bring forward any argument, whatever it may be, to assist them, and if they could obtain access to our rate book there is no doubt they would say, as they will no doubt after seeing this printed evidence, and seeing what the fares are on some parts of the line, You are favouring a certain district, and therefore you ought to give me a reduced rate. That is a state of circumstances that must continue to exist unless you make the rates uniform, and I can see that if you do so "per mile," you will injure trade very much.

13,357. (*Sir R. Hill.*) There does not appear to be any necessary connexion between a publication of the rates and uniform rates. Do you not encounter the trouble you have spoken of very much now that there is a general suspicion, as we find, that certain traders are favoured, and the public is therefore anxious to know what your charges are under all circumstances ? Are you not now very much troubled with such applications ?—Not on the ground of suspicion. I must say that there is no general suspicion. I think you will find that only one or two of the witnesses have said that there was any ; and you will find that the secretary and members of one of the chambers of commerce say they have no suspicion.

13,358. (*Mr. Dalglish.*) Your general objection to publishing your rates is that you fancy they might furnish a ground for claiming similar rates ; that there being a low rate in one district, parties in another district might claim to have that low rate ?—That is one objection ; but the number of the rates is so great that we should say it would be almost impossible to do it.

13,359. (*Mr. Hamilton.*) I suppose the meaning you attach to the words "publishing the rates" is giving access to the public to your books, not publishing for sale ?—Yes ; and I say that it would be impracticable.

13,360. You mean giving access to the public ?—Yes ; I say that it is unnecessary.

13,361. (*Mr. Gower.*) When there is an application made for a special rate who decides upon it ?—If it is in the case of a small trade the goods manager has full power to do that ; and if it is in the case of a large staple trade, like the coal trade, the question would come before the Board specially, and then the goods manager in communication with the general manager would fix the special rate.

13,362. (*Mr. Hamilton.*) Is a revision of the rates a continual occurrence ?—It is a continual business.

13,363. I understood you to say that it had taken you two years to complete some rates with neighbouring companies. Are those subject to constant revision ?—I think I also said that we printed them, and that a large portion of them had required to be altered within the period I mentioned.

13,364. Is the revision of the rates a continual tax upon the services of the establishment ?—Yes ; we have had a staff of clerks doing nothing else, and they have been fixing those rates for the last two years ; and I am certain it will take another two years before we complete all our through booking.

13,365. (*Mr. Glyn.*) The general managers of all the railways meet once a quarter or oftener, and a great part of the time of the general managers is occupied in arranging the rates, is it not ?—Yes, after the goods managers have had their meetings, and for other business.

13,366. (*Mr. Hamilton.*) What are the principal grounds of the revision that takes place ?—They vary, from there having been so many small railways made ; but one of the grounds for revision now is that the larger railway companies are looking over all these rates as through booking as being carried out. There are also the continual requirements of trade as to special rates and from new lines being opened.

13,367. (*Mr. Glyn.*) And a variety of applications for reductions ?—There are continual applications for reductions of rates ; they are not daily, but hourly.

13,368. (*Chairman.*) Have you any acquaintance with the French system of railways ?—Very little.

13,369. You are not aware, perhaps, that all the fares and rates on the French railways are published every three months on all the lines ?—Yes, I am aware of that.

13,370. Why would there be greater difficulty in England than in France in publishing the rates ?—If you made the rates unalterable it would be merely the expense ; but there would be no practical difficulty in it.

13,371. Does not the fact of their being published every three months show that constant alterations do take place ?—I am told that they are not so numerous, and that the rates are unalterable, as a rule.

13,372. Then why should it be necessary to republish them every three months ?—I do not know.

13,373. (*Mr. Glyn.*) Is the same system of rebooking abroad pursued as in England ?—I should say nothing like to the same extent. I should imagine that the number of rates in force in England must be 50 times as many as those in force in France.

J. Grierson, Esq.

27 Feb. 1866.

13,374. Do you know whether they adopt the principle of an uniform mileage rate in France?—I believe they do, or nearly so.

13,375. You have said that when "the arrangements "now being made with other railway companies for "through booking are complete it is quite probable "that the rates and fares in the Great Western books "will amount to 5,000,000"?—Yes, I made the calculation myself, and I got the goods manager and the chief rate clerk to make one also. The figures that I put down were 3,000,000, but that is 750,000 below the calculation. They also said that the 5,000,000 were very considerably below what it would be.

13,376. Can you explain how it is that such a vast number of rates arise from each place to every other place, for instance, there is a rate for every class of goods, and all the passenger rates, will there be anything in addition to those?—We have 500 stations, and there will be five classes, there will be three rates for smalls, probably 14 rates on the average.

13,377. Applicable to every one of the 500 stations, and therefore from each station?—Yes, those would be the ordinary rates to begin with. There would be the passenger fares and the parcel rates, and then the through booking to other lines, and they would soon mount up.

13,378. (*Capt. Galton.*) Could you not exclude from the list all the maximum rates which have been established by Parliament?—We do not fix our rates as maximum rates. We fix a rate from London to Bristol, what we consider the traffic will just bear; if it is 40*s.*, we should not show that separately.

13,379. When the maximum rate was charged, you would not have to make a return of that?—On the higher classes of goods you do.

13,380. (*Mr. Glyn.*) You only put down the working rate?—No. I do not see what advantage it would be to show what the maximum rate was.

13,381. Would not that very much shorten the tables?—No. I think not. It is frequently only in the highest classes that the maximum rate is charged.

13,382. (*Mr. Hamilton.*) You say that a publication of the rates would occasion additional trouble to your staff from the inquiries that would be made?—Yes.

13,383. Putting that question of trouble aside, do you consider that it would be prejudicial in any other way?—No; I do not see that it would be prejudicial; so far as the railway companies are concerned they have nothing to hide, and they do not fear the fullest scrutiny into their rates, if you come to the question of right or wrong.

13,384. (*Sir R. Hill.*) If you charged a moderate fee for the inspection of your tables of rates, would not that keep away idle inquiries?—I do not put it in that way so much as in this, that persons in trade knowing that railway companies do give special rates under certain circumstances, would expend any amount of time and trouble to bring every argument they could think of to bear upon us, why they should have a special rate, and I may add that there are very few persons who have given evidence here, who have not from time to time themselves used every argument in their power to get a special rate for themselves. It is one of the greatest difficulties that railway officers have to deal with to resist the demands of the public for something for their own advantage.

13,385. You admit that under the present system you do not escape that trouble, and you are apprehensive that it would be increased by a publication of the rates?—Yes, if it was made a matter of right.

13,386. (*Chairman.*) You do not give return tickets, I believe, to last for more than one day to places beyond a certain distance?—We issue return tickets where the distance is beyond 50 miles to last two days.

13,387. Within 50 miles over what period of time does the ticket extend?—One day.

13,388. (*Lord Stanley.*) What is the object of the distinction?—It is this, a short-distance passenger can travel with a return ticket within 50 miles in one day, but to passengers having to travel from 50 to 100 miles we give the advantage on account of the longer distance. In the same way for 300 miles we give them four days.

13,389. (*Chairman.*) That is not the practice of all the railway companies, is it?—It is almost universally in practice now. In fact within the last few months a new scale has been issued which has been generally adopted by all the railway companies.

13,390. Will you be good enough to state your opinion as to the establishment of a "Court of Ap-"peal"?

"If it were possible, and it were decided that railways should charge an uniform rate, and uniform terminals, a Court of Appeal would be unnecessary, as the rates would be composed of such simple calculations that any person could make them, and such as, in any case of dispute or complaint, a county or other court could promptly deal with. If, however, as suggested in answer to question 10,151, a Court of Appeal should have power to compel companies to charge rates irrespective of the powers which have been given to them by Parliament, it would in fact be depriving them of the rights in consideration of which they obtained the powers to construct their railways, and for which they agreed to expend their capital, and as a Court of Appeal, such as appears to be desired by some of the witnesses, would, if it had the effect of meeting what they desire, take into account the interest of the public and the traders to a greater extent than that of the companies, their decisions might be most prejudicial to the railway companies' interests. There would be great difficulty in defining the duties of such a court, and the rules by which it should be guided; and what such a tribunal would have to contend with may be seen from the different views which the witnesses who recommend it have expressed as to the proper mode of fixing the rates, &c.

"For instance, the Wolverhampton Chamber of Commerce desire (10,797) that railway companies should not be allowed to charge less than a certain minimum as well as not above a maximum to be fixed.

"Mr. W. Matthews desires (in answers to questions 10,248, 10,265, 10,361) that the rates should be uniform per mile, while Mr. W. Williams proposes that there should be special rates for large lots, and the manufacturers, who roll the iron in South Staffordshire desire low rates to introduce pig iron from other districts to mix and compete with the pig iron locally manufactured, while the mine owners who smelt iron complain of such pig iron being brought as an unfair competition with them.

"One witness (10,461), of great ability and experience in railway matters, even suggests that railway companies might, under certain circumstances, be required to carry at a loss; while another witness from the same district is willing that competing lines should charge higher gross rates where their route was the longest, which would, in fact, do away with competition.

"The case referred to by Mr. Corbett, of the Oxford and Worcester Company (11,069/5) taking up his siding, is a most isolated one, and the fact stated by him of the railway company putting it down again upon his applying to the Court, shows that there is no difficulty, in the present state of the law, of compelling a company to conform to it; and in the case alluded to, if the company were entirely in the wrong in taking up the siding, Mr. Corbett could have obtained damages if he had gone on with his action.

"In the case referred to by Mr. Lees (9,289), the inconvenience to the traffic of the line was removed much more rapidly by the action of a friendly company acquainted with the facts of the case, and with the working arrangements generally, than could possibly have been the case had it been referred to the arbitration of a public Court of Appeal.

"The interests of the public are now protected by—

"1. The railway companies Acts of Parliament:

"2. The desire on the part of the railway companies to meet the requirements of trade, which is shown by the reduction of rates voluntarily made:

"3. The influence of the traders themselves, who can

and do bring any subject of complaint before the directors of the companies, individually and collectively.

"4. The influence of the Chambers of Commerce, such as those which have been represented before the Royal Commission:

"5. The Courts of Law:

"6. The almost annual examination which takes place before the Committees of both Houses of Parliament when the companies are applying for additional powers or opposing other bills; when the traders are always willingly heard by the committees on any complaint which they have to make.

"In the case of the Great Western Company scarcely a session passes without the mode in which their business is conducted, the rates they charge, and the arrangements on the line being referred to in the evidence of traders before Committees, who take an equitable and business, and not a legal, view of the complaints made."

13,391. (*Capt. Galton.*) Have traders always a *locus standi* when Acts of Parliament are obtained?—I believe they have always.

13,392. In cases of amalgamation?—I should not like to answer that question off-hand, but my own impression is that they are always heard before Committees.

13,393. I suppose only in cases where the part of the line affected by the Act of Parliament is in their immediate neighbourhood?—Yes, or in any cases where the tolls or rates are proposed to be altered. Even although the traders do not appear by their own counsel, they are always brought forward by one side or the other.

13,394. In the case of the amalgamation Act obtained by the Great Western Company a few years ago were all the traders who chose to appear heard?—Yes, they were. The only opponents were traders, and they were heard by their own counsel. As a rule, I believe that no railway bill ever passes without the traders appearing as witnesses.

13,395. (*Mr. Glyn.*) Do you find that the county courts are now more resorted to in small actions against railway companies, than they were sometime ago?—I cannot say that our experience is that they are more made use of, because from the first we have had actions continually brought against the Great Western Company in the county court, and even in the superior courts.

13,396. A great number of actions at the same time?—A very large number; that is, upon our own whole railway system the number of actions has been very great.

13,397. (*Mr. Horsfall.*) What have those actions had reference to generally?—Almost everything. The slightest delay, the slightest alleged overcharge, and the claims are very numerous; generally, of course, the object is either to make us pay something or to get back something.

13,398. (*Mr. Glyn.*) Do the Great Western Company make any difficulty as to having these cases heard in the county court, or do they endeavour to move them into the superior courts for decision?—They have never done so, except in one or two instances in which they had them removed to a superior court, because we said it was necessary to have an interpretation of the Act, and the case ought to be decided there.

13,399. (*Sir R. Hill.*) Do you allow packed parcels to be carried on your line?—We cannot help it; it is, unfortunately, the law.

13,400. Do you not sometimes dispute it?—We never dispute the right to carry packed parcels, but what we do is this, we claim to have a right to charge for packed parcels a certain rate per ton, and that has been disputed.

13,401. Have you not claimed a right to charge for packed parcels as though they were separate parcels?—Many years ago, that was before the law was settled, we did that in common with other railway companies.

13,402. (*Mr. Glyn.*) You did it at the time when the law had not so decided it?—Yes, but we do this now; we claim to charge packed parcels at the highest rate, and I say that it is a very great hardship on railway companies that parties are allowed to carry packed parcels at the rates they do. I have sent six half chests of tea and six small bags of rice through a carrier between London and Bristol, and I have had them watched to see when they came to the Paddington station; they were all tied together, and they paid us 3*s.* for the conveyance of them to Bristol, and then they charged separately for them in Bristol. I had arranged with the parties who should receive them, and found from 10*d.* to 2*s.* 6*d.* was paid for those parcels, that is, when they found that a person was in trade, they would charge 10*d.*, and when they thought that other parties could pay, they charged 2*s.* 6*d.*, and they made 300 per cent. out of that. We were compelled to carry them at a rate per ton. I have seen the way bills of a carrier in one case where they got 18*s.* 4*d.* out of the public, and we got 3*s.* 10*d.* In any revision of the railway charges, the enormous profit which those packed parcels people make ought to be taken into consideration in fixing the rates that the company shall be entitled to charge.

13,403. (*Sir R. Hill.*) Is not the delivery of those parcels a very expensive business?—Yes, it is.

13,404. The company is saved that expense?—Certainly; and I should be prepared to make full allowance for that.

13,405. It is thrown upon the carriers?—Certainly.

13,406. Can you give any idea of what portion of the total charge in the conveyance of a parcel is represented by the cost of delivery?—No; but you may take it, I think, at from 1*d.* to 3*d.*, that is for the collection or the delivery, but that is the very highest charge.

13,407. It is double that for both collection and delivery?—It is never 6*d.*, if you take it from 1½*d.* to 2*d.* for either collection or delivery, that is about it.

13,408. Say 4*d.* for each parcel?—Yes.

13,409. Within what distance of a station in a country district, for instance, would you deliver, or have you any absolute rule?—No; but probably a mile and a half.

13,410. Would you deliver a parcel at a distance of a mile and a half for 2*d.* or 3*d.*?—Yes, in a town; but we do not charge that separately, it is included in the delivery.

13,411. (*Capt. Galton.*) Do you allow packed parcels on your line?—They are packed, and we carry them largely on our line.

13,412. I thought it had been much objected to?—Yes; we strongly object to them, but we cannot prevent it; we carry large quantities of packed parcels every day, and I think we have good grounds to complain of it. Persons in London establish an office, and they collect small parcels and bring them to a place close to the Paddington station; they put them into crates, hampers, and bags, and give them to us, and we charge them per ton.

13,413. If you organized a thorough system of parcels delivery, could you not successfully compete with that traffic?—Of course, and we do compete. There is no doubt that we carry the largest number of the parcels; but still, because of the convenience of sending them by the railways, it has induced the public to give a large proportion to them, but these parties to whom I have alluded do get a share.

13,414. (*Mr. Glyn.*) You gave, as an instance, an experiment that you made at Bristol with one of those parties who packed in this way; were the charges for which they delivered the goods, although they appeared high, compared with what they paid to you, lower than your own charges in the town?—The lowest charge was 4*d.* less. Ours would have been 1*s.* 2*d.* to every person. They charged to certain persons 4*d.* less, and to other persons 1*s.* 4*d.* more.

13,415. That was the only gain which the public had when you were deprived of a very large source of receipt?—Yes. Three or four of the principal wholesale grocers in Bristol were the parties who got the lower rate, and some of the private individuals had to pay the higher rate.

J. Grierson, Esq.
27 Feb. 1866.

13,416. (*Mr. Hamilton.*) Then, on the average, there was a loss to the public?—Certainly.

13,417. Because the greatest excess was 1*s.* 4*d.*, and the greatest reduction was 4*d.*?—Yes, and in many cases the public paid more than they would have paid to us, but we suffered.

13,418. (*Sir R. Hill.*) If the public lose by the arrangement, how can you account for the system being encouraged by the public?—Take, for example, the wholesale warehousemen in London, they will take care that they do not lose, because they will make a bargain that their parcels are to be carried cheaper. It is the persons who are not in the habit of sending regularly who would have to pay.

13,419. Is there anything to prevent those persons who do not send regularly employing the railway company?—None whatever; and notwithstanding all that these packed parcels pay, the public, having greater confidence in railway companies, give them the bulk of their business.

13,420. Do you charge less?—Not less as a rule.

13,421. Is it less in any particular instance?—Yes, we charge less in the gross.

13,422. If the public knew that, would they not bring all such parcels to you?—I think they would, if they knew it.

13,423. Would not that be one advantage that would result from publishing your rates of charge?—We do publish parcels' rates occasionally, but we cannot do it continuously.

13,424. (*Capt. Galton.*) If you had chosen to do so, could you not have successfully competed with the Post Office in the carriage of parcels to any of the towns to which you run?—We might compete, but we should injure our ordinary parcel traffic. We have the Post Office collecting and delivering parcels by their present staff, and they get them conveyed by the railway without any extra charge, and all the surplus is gain to them. If we charged as low as the Post Office, we should lose upon our present traffic.

13,425. (*Sir R. Hill.*) You say that the Post Office get these parcels carried without any extra charge?—I say that they get them carried without any extra charge by the railway company.

13,426. The Post Office pays you, does it not, for the whole duty you perform?—They pay for the train.

13,427. They pay you for the whole duty performed by the train in the carriage of parcels; if you conceive that you have a claim for greater payment, is there anything to prevent your making that claim?—No, but what I meant to say was this, that the Post Office started by getting a train service for letters.

13,428. When was that the case?—I am speaking from the very first.

13,429. Are you not entitled once in every three years to open the arbitration?—Yes.

13,430. Why do you not avail yourselves of that privilege?—We have never thought of doing it.

13,431. You seem to neglect your own interest; is that out of kindness to the Post Office?—Certainly not. I am afraid I must have made myself misunderstood. I was not making any complaint against the Post Office, but what I said was this, that the Post Office getting a train run for the letter service tacked upon that the small parcel service, and any surplus that is left over and above the expense of collection and delivery is a profit to them. If the railway companies reduced all their small parcel rates to the same sum it would be a serious loss to them.

13,432. Do you mean to say that in the payments made by the Post Office to the railway companies nothing is paid for the parcels which are sent by the Post Office?—No doubt the service is paid for in the rate per train mile.

13,433. Are you prepared to say that the Post Office does not pay double and treble the amount paid by any ordinary traders for the conveyance of parcels?—I should imagine that they do not pay a tithe of it.

13,434. What kind of parcels are they which the Post Office conveys?—Small parcels.

13,435. What are they otherwise?—I do not know.

13,436. Do you know what the rates they charge are?—Yes, I have a list of them.

13,437. Are they book parcels that you complain of?—I was not complaining at all.

13,438. You have said that the Post Office sends certain parcels by the railway companies for which they make no payment; are they book parcels?—That is one class of parcels.

13,439. Some years ago there was great complaint made on the part of the railway companies that the Post Office carried parcels with very miscellaneous contents; is that the kind of parcel you spoke of?—I spoke of large parcels, not being letters.

13,440. If a parcel, whatever its contents may be, pays the same rate as a letter, then is it not to all intents and purposes a letter?—I am not objecting to its being called a letter for that purpose; all I mean to say is this, that the Post Office have a service which they must have for the conveyance of letters, and then they attach to that also the conveyance of parcels, and they can carry cheaper than the railway companies can.

13,441. Was not that originally a part of the arrangement, that everything carried at letter rates by the Post Office should be carried by the railway companies; was it not part of the bargain that was made?—I speak under correction, but I certainly have always understood that the conveyance of parcels was not part of the Post Office business before there were railways.

13,442. Do you mean to say that there ever was a day when a person might not send through the Post Office anything he chose, if it was not calculated to injure the letters, paying the full letter rate for such conveyance?—Yes, I suppose there was; but what I mean is this, that persons would have had to pay such a high price by weight that they did not send them to the extent that they do now.

13,443. When was it that the Post Office began to carry the parcels of which you speak?—During recent years.

13,444. Do you mean when the penny postage plan was first adopted?—No, more recently.

13,445. Has it ever been the case since the penny postage was introduced that a person could not send a parcel upon paying the full letter rate for it?—No, but the rates have been reduced in recent years.

13,446. Since the adoption of the penny postage?—I think so.

13,447. Is your statement to be understood as applying to the book post?—Yes, it must be so.

13,448. Have you not entered into a contract with the Post Office to carry their mails, which mails are known well to consist in part of books and pamphlets, at a certain fixed sum?—Yes.

13,449. Is it not open to you at any time, if you choose to say that in consideration of your carrying books, or of the mails having increased in weight, you claim a larger amount of remuneration?—I have no doubt it is, but I must again say that I am afraid I must have been misunderstood. I answered a question that was put to me by Captain Galton, and I did not intend to make any complaint as to the payment made, or as to the Post Office carrying parcels. What I intended to say was, that if we were to compete with the Post Office we should lose very largely on the present parcel traffic that we carry.

13,450. If it was not to compete with the Post Office, have you any system by which you could convey parcels at an even rate from any part of the kingdom to another?—No, we (Great Western) could not, without working in connexion with other companies, we could only carry over a portion of the country.

13,451. Are you aware that the railway companies employ the Post Office to convey their book packages even to large towns, which are in immediate connexion with railways?—Yes, they do, no doubt.

13,452. Does not that show it is a very great convenience to the public that there should be such an arrangement?—I do not deny the convenience at all.

13,453. (*Mr. Hamilton.*) I understood your meaning to be, not that the railway company lost by its contract

with the Post Office, but that, owing to the Post Office having undertaken certain duties which it did not originally perform, they had deprived you of a certain amount of traffic which was formerly a source of profit to the railway company?—That is so, although I did not originate the idea.

13,454. (*Sir R. Hill.*) Do you affirm as a fact that the Post Office has withdrawn from your company a profitable business by the establishment of the book post?—I have no doubt that if the Post Office did not convey them at the price they now do, we should carry a large proportion as parcels.

13,455. Do you mean as single parcels or as publishers' parcels?—No doubt a good many of them would be carried as publishers' parcels, and some as single parcels.

13,456. Do not you charge the Post Office very much more than the publishers for the necessary weight of the book parcels?—Yes, per ton per mile, no doubt we do, but they have a special service. We run the Post Office special service at a very much lower rate per train mile than we run a train for the public when they require a special train.

13,457. Because you run several trains regularly every day for the Post Office?—Yes; between certain places we run a train up and down.

13,458. Would you not be happy to enter into an agreement with any private individual to give him the same number of trains at the same speed, and for the same payment?—Yes, no doubt; so long as we got a profit we should run any number of special trains; but we are charging the Post Office certainly one-half the price that we now charge a private person when he asks us to run a special train.

13,459. The Post Office does not ask for a special train, but for five or six trains regularly every day; do you call them special trains?—There are two descriptions of service. The one is a special train devoted to the Post Office alone; therefore I call that a special train. The other is the use of all our regular trains, and of course I do not call that a special service.

13,460. That which you call a special train, because it is devoted to the Post Office alone, is a train running every day in both directions, is it not?—Yes; probably the correct term would be a special service.

13,461. (*Chairman.*) Do you carry passengers by it?—No, not by the Post Office mail.

13,462. (*Sir R. Hill.*) Do you recollect who raised an objection to carrying passengers, the Post Office or the railway company?—That I cannot answer.

13,463. (*Mr. Gower.*) Although you object to a Court of Appeal for fixing rates or for establishing uniform rates, do you see any objection to giving the Board of Trade the power of deciding cases of complaints as to passenger trains not meeting at junctions?—I certainly would very strongly object to that, unless there were some definitions as to what the powers and duties of the Board of Trade were to be. I know of nothing so difficult as making trains join at junctions. On the Great Western line we might take, as an illustration, a train running from South Wales, North Wales, and the Weymouth district to London, and this train to meet trains from 35 branches of our own. We find it the greatest difficulty that we have to contend with to make the trains meet at those junctions, even upon our own line. But then, in addition to that, we have to meet the trains from 14 branches upon lines working very closely in connexion with us; that is quite irrespective of the junctions with other lines, which are either competing with us or are altogether independent, so that it would be an exceedingly difficult thing to make the trains to meet at the junctions.

13,464. Could you not rely upon a Court of Appeal making due allowances for those difficulties?—I have not the slightest doubt that they would make allowance for them, because they are so obvious that they could not but do so; but certainly it would be very desirable to lay down some rules by which any such court shall be guided.

13,465. (*Capt. Galton.*) Would it be possible to lay down any such rules?—I am afraid I cannot say I think so. The most difficult thing that we have to contend with is endeavouring to fix our trains to meet at the junctions.

13,466. (*Mr. Gower.*) Would not it have this result, that it would satisfy the public that the matter was very much more difficult than they imagine at present?—I think it would do that; but as between three neighbouring companies we have a clause in the agreement with them that we are to make the trains meet at convenient times at the junctions, and therefore it is actually compulsory upon us and upon them; and yet we find it impossible actually to do so.

13,467. (*Capt. Galton.*) You cannot do it with your own trains?—No, we find it impossible; and if you take the map of any one railway company, for instance, that of the Great Western, you see the trains are travelling east, west, north, and south; in fact, in every direction you will find trains travelling over that system, and to make them join at all their own junctions is impracticable; but when you take into consideration that other companies have the same difficulties to contend with on their systems, and that they have to try to meet all the trains at all their various junctions, the thing becomes impracticable except in this case: if you were to run fewer trains, and to take more time, or if you were to run a very great many more trains over certain portions of the line, then no doubt you could get better communication at the junctions. In the case of taking more time and running fewer trains, of course the public would suffer; and in the case of running more trains, of course the company would have to go to much more cost.

13,468. You do not think that any advantage would accrue to the public from there being a power of arbitration lodged somewhere in respect of those trains?—I do not think there would. I think that the interests of the companies themselves now, and the very much better feeling which exists between railway companies than existed some years ago, will correct that evil as far as it is possible. Every one knows that within a very few years railway companies were so opposed one to another in every respect that they threw every difficulty in the way of any communication at junctions; but now that the smaller lines have become absorbed into the larger systems the companies have been very much more anxious to interchange traffic at junctions; and I believe myself that that will be the best security that the public can get at present.

13,469. (*Mr. Gower.*) Would not such a Court of Appeal have been useful in former times, when this disinclination to interchange traffic existed?—They have Parliament, you know, which is a Court of Appeal which we always like to be very careful in preparing for.

13,470. (*Capt. Galton.*) The evil, you think, has corrected itself before this time?—No, I do not by any means say that. What I mean is, that it is correcting itself, I believe (speaking of the part of the country that I am acquainted with), as rapidly as can be done.

13,471. (*Mr. Glyn.*) As regards the principal lines, the principle of the interchange of traffic one with another is one which they always adopt, do they not, for their own sakes?—We adopt it for all non-competitive traffic; that is to say, where the public desire it, they get through-booking between any two stations from or to our line, but we certainly do not adopt it to enable another company to compete with us. Some of the witnesses who have been examined, I see, desire a universal interchange of traffic, which I think would be very unfair towards existing companies, except on fair terms, and to a great extent useless as regards the public. Take the case of a new railway springing up, we will say, from Hampton, which is a few miles out of Birmingham, upon the London and North-western railway, running through an agricultural district, avoiding all large towns, and joining the Great Western railway at Southall. Such a company as that of course may say, We want mutual facilities; we will interchange with you if you will interchange with us. Of course we

J. Grierson, Esq.

27 Feb. 1866.

have incurred all the expense of a station in London, getting out of London, and have the expensive service there. Then at the other end the London and North-western Company have incurred a large expense in Birmingham. Independent of that, the London and North-western Company have made stations at Rugby, and we are at Leamington, and the London and North-western are at Coventry. This new line would cross those lines, and the new company would be delighted to interchange traffic at the junctions for those towns; but neither the Great Western nor the London and North-western Company would get anything in return, because this new company would have made their railway through a cheap district, and one not producing a large or new amount of traffic.

13,472. (*Mr. Hamilton.*) Do not you see that that is merely a question of terms; what you object to in your statement now is the inequality of interchange?—Yes.

13,473. But it does not follow, does it, that it should be unequal; why cannot it be arranged upon fair terms?—We have no objection to the public getting such through booking and facilities as the interests of the public require, but for the interests of the companies we desire that it should be on fair terms.

13,474. (*Mr. Glyn.*) Is not the principle upon which the division of traffic, when it goes into a joint purse, is very often made, this, that an allowance out of the general receipts is made to the company which has incurred the largest cost in stations, and so forth?—No doubt, and to the one that has got the best line.

13,475. Might not that principle, if adopted generally, obviate very much the difficulty which you have stated?—Yes; but that question of a joint purse is one which the public object to almost more than anything else, because they always say that it is doing away with competition. Whether it is so or not, they very strongly object to it, because on the one hand they desire to have competition between the railway companies, (indeed some of them will even desire to have a competition of fares and rates, which I say is an impossibility for any length of time,) and on the other hand, they desire to have all the conveniences of companies working together in friendly relations, whereas the two things are quite inconsistent. I should like to read the preamble of an agreement which I referred to, and which bears upon the point which has been mentioned. It is this, "Whereas it would be to the advantage of "the companies themselves and also to the public that "the lines of the companies should be more fully used "for the accommodation of the traffic of each other by "mutual facilities, through booking, the efficient working of trains at convenient times, and, as far as "practicable, in due connexion, so as to satisfy the "reasonable requirements of the public, and develop "the traffic to be interchanged, and that such arrangements should be made at junctions, stations, and in "transit as shall carry out the above objects." From this it will be seen that it is an object with some railway companies to endeavour to meet this question as far as they can. That clause applies, I may say, as far as the Great Western Company is concerned, to all the large companies that we meet, and in two cases is compulsory upon us by law. I may also say that it is for our own interest, for railway companies find the difficulty in arranging the trains to be a most serious one. We have found it almost impracticable as yet to lay down anything like a perfect service of trains which will effect the object. It will be years before it can be brought to anything like, I will not say perfection, for that is impossible, but to be worked satisfactorily. I should wish, while we are upon this subject of the interchange of traffic, to refer to another point which is very much complained of, and that is the irregularity of the trains. The irregularity of the trains depends not only upon the trains meeting at the junctions, which, as I have before said, is a very great difficulty, but it also depends upon the irregular amount of traffic. Some days we have a train comparatively without any luggage, and at other times with tons of luggage; so that it is impossible, without keeping a very large staff indeed at the stations, to get the trains off to time, or to get the luggage or the passengers in and out of the stations within the usual time fixed. If you will allow me, I have here a diagram of the traffic upon the Great Western railway, showing the gross receipts for each year, each division being for a week, which I will show you. (*The witness produced a diagram, and after explaining the same to the Commission handed it in.* See Appendix CD.) The irregularity of the receipts which you observe represented upon the diagram will to some extent show the difficulty that a company have to deal with in having to provide for the maximum amount of traffic, and yet to give a train service which will be satisfactory to the public; because if we were to take the maximum amount of time, taking all the year round, we should have continual complaints. I may say that diagram refers to the Great Western Company only. It will be seen that the irregularity of goods and in the transit of private waggons is affected in like manner. Sometimes at a junction we have three or four special trains of coals sent in without a moment's notice, and the next day probably nothing like the quantity.

13,476. (*Earl of Belmore.*) Do you generally run your goods trains at fixed hours, or do you have many special trains?—We run as many as we can at fixed hours, but we have a large number of special trains, out of the mineral districts especially. The only way to get over the irregularity of the trains would be to take the maximum amount of time with every train, and that I am certain the public would not stand.

13,477. (*Chairman.*) Do you ever give a longer time for your trains in the summer months, when there is a great deal more passenger traffic than in the winter?—No, on the contrary; the public wish to travel quicker in the summer than in the winter.

13,478. (*Mr. Hamilton.*) Have you been able to trace any amount of irregularity to the want of vigour on the part of your officers at the different stations?—There is no doubt that occasionally a want of smartness sometimes does exist.

13,479. But that is continually under consideration, is it not?—It is a fortnightly subject of consideration. On the Great Western railway we have a special committee which sits once a month, and the superintendents are required to report that they have travelled with any train that is irregular; that is, they are required to say that they have travelled on such and such days with that train, and to say what the causes of the irregularity were.

13,480. As a general rule do you find it attributable to an extra quantity of luggage, or some great increase in the traffic, or does it arise from some want of vigour or smartness on the part of the officers?—Of course, sometimes there is a lax station-master or a lax guard, which does cause loss of time in a train throughout the line; that does occur occasionally, no doubt, but the great difficulty is the irregularity of the traffic, slippery rails, &c. To illustrate that, I may say that we have a small branch railway which goes to Wells, and we have a train running to Wells from the junction on the arrival of the 9.15 express from Paddington, that train has just time to get up to Wells, turn the engine, and get back to bring passengers for the up express train due in London at 6.10. If the 9.15 train is a heavy train, which in the summer it probably is one day in the week, so heavy as to cause an irregularity, the train does not get to the junction in time; say it is 10 minutes late, therefore the branch train does not start punctually and it does not get back until 10 minutes behind time, and then the up express is kept 10 minutes, and we cannot get over that in any way whatever, except by putting on another engine to run on a line which does not pay now.

13,481. Then it is just a question of cost?—Yes, it is just a question of cost, and it cannot be done in this case without heavy loss.

13,482. Do you find the unpunctuality greater at periods of the year where there is a great deal of excursion traffic?—We do, but it does not arise entirely from

the excursion traffic, but because the trains then are on the whole heavier; often the traffic varies very much on different days in the week.

13,483. (*Earl of Belmore.*) Upon what principle do you charge express fares by some trains and not by others which stop at the same stations and miss the same stations. Take, for instance, the 2.10 train from Paddington to Bath, and the 4.50 train from Paddington to Bath, they stop at the same stations between London and Bath, and the one is an express fare and the other is an ordinary fare?—The 2 o'clock train stops at more stations than the 4.50 train.

13,484. Not between Paddington and Bath, does it; it stops at Reading, and Didcot, and Chippenham, and the 4.50 train does the same?—The 2 o'clock train, which your Lordship speaks of, stops at Wootton Bassett.

13,485. Not always, does it?—It is so in the time table. The best answer I can give to that is this, that the 2 o'clock train was a train which stopped at a great many more stations than it does now. That is gradually becoming a heavier train, and with the view of making it keep time, stop after stop has been taken out. To show that this irregularity in the amount of traffic does not apply to the Great Western railway only, I have taken the traffic receipts of last year of all the railways in England, and had a diagram made of them, and the Commissioners will see that it is the same with regard to them. (*The witness produced another diagram, and after explaining the same to the Commission, handed it in.* See Appendix CE.)

Bearing upon the subject of the punctuality in the running of trains, which is admitted to be one of general importance as well as a question of convenience to the public, I have prepared two diagrams showing the number of passengers and the weight of excess luggage booked from Paddington each day in the year 1865. (See Appendices CF. and CG.)

It is not possible to make anything like a correct estimate of the ordinary luggage allowed to and carried by passengers, but the quantity is fully as irregular as that of the "excess" luggage.

It is evident that the number of passengers getting into and out of, and the loading and discharge of the luggage at stations, has a direct bearing upon the times trains are necessarily detained, as well as the weight of the trains has in running.

13,486. (*Chairman.*) Have you anything further to add with regard to that point before we go into the terminal charges?—Nothing further, I think.

13,487. Will you now proceed to state to the Commission your views with regard to terminal charges?—"Terminal charges are made to cover the interest on the cost of the construction and the maintenance of stations, sidings, sheds, cranes, turntables, and machinery, the interest on the cost of land, expenses of porterage, shunting, clerkage, stores, and other charges incidental to the receiving and forwarding of goods and mineral traffic by railway. In the case of canal companies who were toll-takers only, the carriers made the charges for the wharfage, cranage, shed, and other accommodation, when not provided by the canal company, and the canal companies made a charge for such of them as they provided. If the railway companies had remained toll-takers only the carriers would have had to construct their own stations, and would, of course, have been at liberty to make whatever charge they thought proper or could obtain, being under no such Parliamentary restrictions as railway companies. If terminal charges were abolished, and, as suggested by one witness at question 11,297, the mileage rate included not only the conveyance, but the station accommodation and services, the maximum rate per mile would have to be made very high, as, for instance, say for 12 miles."

	s.	d.
The present maximum rate for sugar, for 12 miles is, say 2*d.* per mile - -	2	0
Cost of terminals at both ends, say - -	4	0
Total - -	6	0

"Or equal to 6*d.* per ton per mile, station to station. The same witness advocates a uniform mileage rate, so that, taking a case where sugar would have to be conveyed for 100 miles, the rate would be 50*s.* per ton, station to station, which would be such an excessive rate that the traffic would not bear it, showing that a uniform rate per mile, to include terminals, is impracticable."

13,488. (*Lord Stanley.*) I suppose you put it in this way, that if the terminal charges were included in the mileage rate it would give a very unfair advantage to those who send goods only for a short distance, because they involve the same amount of trouble at the terminus?—Precisely so.

13,489. And they would not pay to the same extent by travelling over the line?—No; of course the terminal expense for traffic passing 10 miles between two stations is the same as it would be if it travelled 100 miles.

13,490. (*Mr. Horsfall.*) You do not object to a maximum terminal being fixed, provided that maximum is a fair one?—I have no objection whatever to it, taking into consideration the cost which the companies have incurred in constructing the stations. At present the clause which governs the charge is that it shall be a "reasonable charge." Speaking for the Great Western Company, I do not think they would have any objection to the maximum being fixed, of course, fair consideration being given to their very large amount of expenditure.

13,491. (*Mr. Glyn.*) Would you determine the terminal charge upon a calculation of the average of the whole outlay on all the stations?—I do not know any other mode than that or the present in which it could be done, although personally I have always opposed it even when it was under consideration before, because there are many stations upon the line where our expenses are very high. Bristol, for instance, is a most expensive station, having a lift, and Paddington is an expensive station; Birmingham is an expensive station; and therefore unless the average was made pretty high we should lose upon those and other similar stations.

13,492. London is always an exception, and there is a special terminal rate made for London, is there not?—Yes, and if it were done so no doubt it would be an advantage to us.

13,493. (*Capt. Galton.*) Do you charge a higher rate at Bristol, where you have all those extra expenses, than you do at other stations, Birmingham for instance?—No, I cannot say that we do, and I will tell you why. It is because so long as we keep down our maximum charge under the Act of Parliament we have only to consider what the traffic will bear.

13,494. But your terminal is not limited by the Act of Parliament?—No.

13,495. It is an addition to your toll?—Yes; still, although we might have the power to charge a higher sum at Bristol, yet, if the traffic will not bear it, it is no use our putting it on. I asked our engineer to try and make a calculation of what the cost of the stations and sidings upon the Great Western railway was, and they tell me that about six millions and a half of money has been expended. We have, I think they say, about 357 miles of sidings.

13,496. What has been your total expenditure on the Great Western railway?—Including branch lines it is something like 45,000,000*l.*

13,497. (*Mr. Glyn.*) In making up your terminal charge, what would you include in it as the proper heads of calculation?—The cost of the land, the cost of the sidings and sheds, buildings, cranes, turntables, and all the outlay necessary for loading and unloading the goods, and for marshalling the trucks, and then the porterage, the clerkage, watchmen and people connected with the station; the working charge of the station, the shunting, both engine and horse shunting; in fact everything that would have been done by the carriers, and which would have to be done by the carriers to-day if the railway companies were to cease to carry. Supposing we were to cease to carry between any two points upon our line, carriers would imme-

J. Grierson, Esq.

7 Feb 1866.

diately spring up, and they would simply pay us the toll under the Act of Parliament, and they would perform all the same services and find all the accommodation; and they would of course take care to be covered by the charge made to the public, and they would be in this position, that they would not be limited by the word reasonable, but only by what the public chose to pay them.

13,498. (*Chairman.*) You would not allow them to use your sidings and station accommodation without payment?—Certainly not. It would be utterly impossible for a railway company to go and expend, as we have done, millions of money for siding accommodation, without getting any return whatever.

13,499. (*Mr. Horsfall.*) You stated that you include the cost of the land in your terminals; you mean the interest on the cost, do you not?—Yes; it would include interest upon buildings and sidings, and so on.

13,500. (*Chairman.*) Will you proceed with your statement with regard to private waggons?—"The Great Western Railway Company provide waggons for traders when called upon, but the traders necessarily send their traffic very irregularly, depending, as it does, upon the requirements of trade, so that sometimes they demand a very large, and at other times a comparatively small, number of waggons, the consequence of which is that during some periods of the year large numbers of the company's waggons are standing idle, while the traders continue, to a great extent, to keep only such a number of waggons as they can employ with comparative regularity all the year round. In the case of private waggons, the Great Western Railway Company work them in every respect as quickly as they do their own. No preference whatever is shown in their transit, except that cattle and perishable goods take the precedence of all other goods traffic, and general goods of minerals; and every facility is offered to the traders to trace their waggons through the company's books; or, in case of alleged continued or special irregularities, an inspector is put on by the company to trace the working, and every means is adopted to facilitate the transit of private waggons, the same as if they belonged to the company. In some respects the finding by the railway company of all waggons required for the traffic would be of advantage, inasmuch as it would, in many cases, save the cost of the unnecessary shunting which arises in separating the various private trucks; and the waggons could frequently be loaded back, instead of being sent home empty; but there would be a great difficulty, unless a very large surplus stock were kept, in satisfying the traders when traffic was generally brisk. In the northern division of the Great Western railway, the company, at one time, found all, or nearly all, the trucks employed for the conveyance of coal from the North Wales district, not only locally, but also to Saltney and Birkenhead for shipment, and the company were quite willing to have increased the stock as might be required, but when trade was very good the colliery proprietors always loudly complained if they did not immediately obtain all the trucks they required on demanding them, and at the same time they detained them sometimes even for weeks at the port, either from a desire to have coal ready to load any vessel that might offer, or from causes which they could not entirely control, such as waiting for vessels out of graving dock; but this was done to an extent they never would have allowed if the waggons had been their own, while at the same time they refused to pay demurrage, on the ground that the detentions were unavoidable considering the circumstances under which their trade had to be conducted. In the case of a railway company finding trucks, they do so at any time, as far as they can, at the request of the trader; and when a trader finds his own waggons, a sufficient allowance is always made to cover the mileage wear and tear, and ordinary detentions, so that railway companies could not be required to become liable for demurrage on trucks delayed by irregularities in the amount of traffic, the sending of too large a quantity to one station at a time, or the other numerous causes of detention over which the company have no control. With respect to the suggestion that private waggons should be dealt with under the clearing house regulations, railway companies charge and pay demurrage as between themselves, on waggons detained beyond the stipulated period; but in that case they interchange stock with each other, and have the power to load them back on their return journeys, but even railway companies do not allow each other either mileage or demurrage on waggons loaded with minerals under the clearing house regulations. In fact, so far as the mineral proprietors are concerned, and some of them have suggested to the Commission that they ought to be paid demurrage upon their waggons, they are in precisely the same position as the railway companies put each other in with the same description of traffic."

13,501. (*Earl of Belmore.*) A witness the other day suggested that the waggons of private owners, whether they were many or few, ought to be admitted to the clearing house system; what is your opinion upon that point?—That is what I have already referred to. The object of course of getting them put into the clearing house would be that we should be compelled to pay demurrage. If a waggon was delivered at one junction, say on Monday morning, and it did not according to the clearing house regulations get back again by Thursday morning, then they would wish that we should pay demurrage. What I say with regard to that is this, that where the traffic is given to us irregularly by the traders themselves, (and they cannot always avoid it,) it would be a very great hardship to impose upon the railway company the payment of demurrage when the railway company were not the cause of the delay. I took out the traffic day by day of two of the persons who have given evidence before the Commission, and I find that on some days they sent us 120 tons of traffic, and on other days not a truck. And to some extent in the same way with Mr. Corbett, who complained about his salt waggons, I find his traffic irregular, also, although not so irregular as what I have just mentioned. When such a state of things applies over a whole system of railway, it must be manifest that it is very difficult indeed to provide a stock of engines, and to perform the service without some delay being incurred. And further, I say, that in fixing the rates for the conveyance of traffic in owners' waggons, we take into consideration that they must be allowed a sum which will enable them to find the waggon. And if they can get, say, about 15*l.* a year out of the waggon they ought to be perfectly satisfied, because we never would allow them to make, say, 20*l.* or 30*l.* a waggon. We then would raise the rate, because they could afford to pay it. And so railway companies between themselves have found the same difficulty, and I might almost say the impossibility, of becoming responsible to each other when they send waggons with minerals off their own railways on to other railways. And I do not think that the trader ought to ask to be put in a better position.

13,502. (*Capt. Galton.*) Your argument is that in the rate which you fix for conveying goods in traders' own waggons you take into consideration the fact that those waggons can only work to a very limited extent, and run a limited number of miles in the year?—Sometimes we do; but traders' waggons as a rule (of course I speak only as far as I know upon our own railway) work exceedingly well. We have parties who rent our waggons from us, and pay us for some of our broad gauge waggons 20*l.* a year, and in order to do that they must get three trips a fortnight between South Wales and Basingstoke, and they do make three trips a fortnight.

13,503. They look after the waggons much more carefully when they provide them themselves than when you provide them?—Yes. Of course in the transit it does not depend upon them, but at the terminal stations it depends upon their customers, and that is where a difficulty lies. The customers make it as a rule a matter of convenience to themselves to unload the waggons, the waggons not being their own, and the sender of the traffic of course would like to make the company responsible,

because he thinks that we then could come upon the consignees. We find it almost impossible at the present time to collect our own demurrage, and we certainly would not like to be made agents to collect the demurrage of other parties.

13,504. In fact the parties who receive the goods very often make use of the waggons as warehouses?—Yes, sometimes.

13,505. (*Mr. Glyn.*) In fact the real difficulty arises from the irregularities of the deliveries at the termini, does it not?—The irregularity of the quantity of the delivery to the customers. All through the winter you may take it that from November to March the traffic is very irregular, the colliery proprietors and other persons who own their own waggons will take care to supply their best customers first. And they supply the others afterwards, and then probably they send much more than they are able to unload and to deliver within a reasonable time.

13,506. (*Mr. Hamilton.*) Is there no report sent to them, in cases of detention, as to what the causes are?—No, not with regard to detentions at the terminal stations; but with regard to anything like the breakdown of a waggon which has been referred to by one of the witnesses, we always send the owner a formal notice stating that the waggon has broken down and the causes of it. We certainly do not keep any account of the detention of waggons by the consignees.

13,507. (*Chairman.*) You think that that is the business of the parties themselves to look after?—Yes, as between buyer and seller, in fact.

13,508. (*Earl of Belmore.*) I gather from your answer that you think that in some cases it would be found that the colliery owner himself is to blame for the detention of his waggon by sending to certain customers a greater number than they can unload in a given time, is that so?—That is so. I cannot give the Commission a better instance than one I have just thought of. The London and North-western Railway Company obtains a large quantity of coal for locomotive purposes from one of our colliery branches in North Wales. Their engineer complained, some time ago, to Mr. Cawkwell, their manager, that their waggons were very much detained. I put on an inspector to look after them for a short time, and I found this,—that the colliery proprietors, whenever they had a vessel at Birkenhead waiting for coal put the London and North-western Company's waggons into a siding and let them lie there until they had sent off their own coal in their own waggons, and that then they loaded the London and North-western Company's waggons. If those waggons had been for a coal merchant it is quite probable, in fact I have no doubt it is certain, that as soon as they had loaded the vessel they would have sent so many waggons to the merchant that he could not have unloaded them probably within three or four days.

13,509. (*Chairman.*) When you made the discovery of this state of things were you able to apply any remedy?—No further remedy than to tell the London and North-western Company that they must look after it themselves. Of course we put the London and North-western Company in the same position as any other traders.

13,510. (*Capt. Galton.*) One of Mr. Corbett's complaints, I think, was that he forwarded salt to Bristol in narrow-gauge waggons belonging to the Midland Company and that then it was detained there for want of broad-gauge trucks, and that he was called upon to pay demurrage to the Midland Company whilst it was so detained?—I observe that he did make that complaint.

13,511. Was that salt waiting for the waggons of the Great Western Company?—Not at Bristol, but at Gloucester. There is no doubt that that is the case sometimes.

13,512. That would be a hardship upon him, would it not?—No doubt it is a hardship. I do not say that it is not. At the same time I must explain that we find waggons for salt upon the broad gauge system, which no other company does. There is no doubt that it is inconvenient, and that to some extent arises from the irregular amount of traffic which we have received. During the summer we have, I might almost say, thousands of waggons, certainly a very large number of waggons standing idle, and then in the winter we have not enough.

13,513. In the cases of traffic such as salt, which is irregular, and coal which is irregular, do the persons who are sending the traffic give you notice so many times beforehand that they are going to send traffic?—Not an hour's notice. Traffic is given to us out of the various branches without any notice whatever. But we keep persons running up and down amongst the collieries and large works in order to keep ourselves advised as much as possible, but it is impossible to do so perfectly.

13,514. It would not be unreasonable if they should be required to give you notice, would it?—Except that I do not think it would be practicable. It is one of those things that we must put up with as well as we can. They do not do it on purpose; it is the nature of their business.

13,515. I presume their orders come in and they are obliged to comply with them as they can?—Yes. Take for instance a colliery, once a fortnight the men will be off for a couple of days in the week doing nothing, and on the next day they will have a large quantity of traffic. Then probably they may be slack for a week, and then vessels may come into dock and trade may be very brisk. I do not think that any regulation would ever overcome that.

13,516. (*Chairman.*) Do you consider the inconvenience arising from the break of gauge to be very great?—In some parts, no doubt, it is objectionable.

13,517. Do many delays arise from that source?—Not to a very large amount.

13,518. (*Earl of Belmore.*) Do you find that much damage to the goods arises from the necessity of loading and unloading them, where a break of gauge occurs?—I do not think that the amount of damage done to goods is considerable.

13,519. (*Capt. Galton.*) Of course the cost of loading and unloading is considerable?—It is probably about from 8*d.* to 1*s.* per ton.

13,520. (*Earl of Belmore.*) Does that apply to coal traffic?—No; upon coal traffic it would probably not be more than about 4*d.* to 6*d.*, taking in all the expenses, excepting, of course, the damage to the coal.

13,521. How would you provide for that; would you do it by an addition to the terminal charge?—We do not perform that service ourselves; we allow the public to do it. At Salisbury, for instance, where we have a pretty considerable coal trade passing from the south-western district on to the South-western line, the parties do the transfer themselves.

13,522. Are the colliery owners obliged to have agents there to see to that?—They have, generally, an agent for the sale of their coal, and, therefore, the same agent sees to the transfer of the coal.

13,523. (*Capt. Galton.*) When you bring up coal from Staffordshire do you bring it up by narrow gauge to London?—We bring it both by broad and narrow gauge. We bring from the broad gauge branches *viâ* Gloucester, and we bring the narrow gauge traffic through Hereford.

13,524. (*Chairman.*) You mentioned some time ago 15*l.* per waggon as the amount that a private owner ought to get for each waggon annually; is that the gross amount out of which they have to keep the waggon in repair?—Yes.

13,525. A narrow gauge waggon costs somewhere about 100*l.*, does it not?—They can get the very best narrow gauge waggons now, probably from 75*l.* to 80*l.* each.

13,526. How many tons would such a waggon carry?—Eight tons. You would get them with wheels not of the best quality, for perhaps about 65*l.* to 70*l.* each.

13,527. (*Mr. Hamilton.*) Do you consider that the

J. Grierson, Esq.

27 Feb. 1866.

traffic on the double gauge is increasing or diminishing?—So far as the Great Western railway is concerned it is somewhat diminished by our amalgamation with the West Midland railway, because that gave two routes for the traffic to London. Before the amalgamation we had the only communication with the broad gauge branches in South Wales, and it was very loudly complained of; but by the amalgamation with the West Midland railway we make not only a part of the South Wales portion of our line, but also our line from Oxford to London useful for both gauges.

13,528. (*Mr. Glyn.*) Have you found the admixture of the two gauges inconvenient?—We found having one gauge only a very great inconvenience at the time.

13,529. (*Capt. Galton.*) What would be the cost of altering the broad gauge to the narrow gauge on the Great Western system?—That I cannot answer offhand, but the cost of the simple alteration would be only a comparatively small element in the question. The value of the stock, which of course is very large, would have to be taken into account.

13,530. (*Mr. Hamilton.*) Do you know what the present broad-gauge rolling stock of the Great Western railway has cost?—Probably two millions; the Great Western broad-gauge stock alone.

13,531. Does that include locomotives and carriages?—Yes; speaking roughly, I think it is about that, but probably, if you take the whole broad gauge on our lines and on the lines in connexion with them it would be about four millions.

13,532. (*Chairman.*) Is the dead weight in a passenger train more upon the broad gauge than upon the narrow gauge?—I should say no to that, because we do not run such long trains upon the broad gauge as we do on the narrow gauge.

13,533. Do you think it would be practicable to reduce the dead weight in passenger trains and to give sufficient accommodation to the public by running a smaller number of carriages than you do run at present?—Yes, it would be quite possible; but I am bound to say that the public are very much averse to it; they desire to have a through carriage by every junction, and the consequence is that the trains now are becoming very long, and that is one of the causes of irregularity in the time.

13,534. (*Mr. Glyn.*) That is quite unavoidable, is it not?—It is unavoidable if you give the convenience in accommodation. Most railways, I think, try periodically to reduce their trains, and for a short time they cut down the number of carriages in a train; but it is very soon found that the complaints are so great that they have to be put on again.

13,535. (*Sir R. Hill.*) So long as that is the practice, is not it quite impossible to hope to fill an ordinary train with passengers?—You cannot fill it, as a rule.

13,536. So that all calculations of possible reductions founded upon the hypothesis that a train will be full of passengers are fallacious, are they not?—Yes, quite so.

13,537. (*Mr. Glyn.*) In fact you must always provide for the possible maximum loading?—Yes.

13,538. (*Mr. Hamilton.*) There is no doubt that the public in the long run pay for the additional convenience which they get?—No doubt they must, that is if you take it that the railway company must live, and some of us scarcely do that.

13,539. (*Sir R. Hill.*) Do you give the same convenience to second-class passengers as to first-class passengers, of passing them in the same carriages from the branch to the main line and *vice versâ*?—I think I may say yes to that, although probably not to the same extent, but in recent years all railway companies have been making what has been called composite stock, which does give the same amount of accommodation to the second class as to the first class.

13,540. (*Chairman.*) Those carriages are considerably used on branch lines, are they not?—They are very considerably used on all railways now. It is a class of stock which, in consequence of the great interchange of traffic, is being built very largely by all companies. We are building them very largely at the present moment.

13,541. Do you ever take third-class passengers on to branch lines in the same carriages?—Yes, where they are long lines, but not where they are small branch lines.

13,542. The third-class passengers have to change carriages much more frequently than the first and second classes?—Yes, they have.

13,543. (*Mr. Hamilton.*) You gave an answer just now with regard to the cost of altering the rolling stock. Can you give the Commission any information as to the cost of relaying the line, making it from broad gauge into narrow gauge?—Probably about 500*l.* to 750*l.* per mile; but I should not like to commit myself to that.

13,544. (*Chairman.*) Would the whole of the rolling stock of the broad gauge system become useless if the broad gauge line were converted into a narrow gauge line, or could any of the stock be converted?—A certain portion of the materials no doubt could be made available for the construction of other stock.

13,545. (*Mr. Hamilton.*) The wheels and axles might be used, for instance, might they not?—The axles, I believe, might be used, but I should not like to speak positively as to the wheels, because they are larger than those on the narrow gauge; but there is no doubt that many portions would come in, for instance, the springs and many other portions.

13,546. (*Earl of Belmore.*) On the northern part of your line, on which you have both gauges, do you think, on the whole, your tendency is to run narrow-gauge trains or broad-gauge trains?—More to run narrow at present, because we have such a large addition to our narrow-gauge lines north of Oxford and Birmingham.

13,547. In case of your having to increase the quantity of your stock you would rather increase your narrow-gauge stock, and utilize your existing broad-gauge stock on the southern portion of your lines?—Yes, we are doing that. We are increasing our narrow gauge much more rapidly than we are the broad. The great increase of traffic has been more in connexion with the narrow-gauge lines, and lines with which we have amalgamated recently, than on the broad gauge, although that has largely increased also.

13,548. (*Capt. Galton.*) Do you consider that any additional safety could be afforded to the travelling public by conferring further powers on the Board of Trade?—No; I do not. I think that if the Board of Trade now, with their present powers, could show the railway companies any reasonable method by which they could increase the safety of the public, the railway companies would be only too glad to adopt it. Our only difficulty is to know what to do. I do not think that there is any subject upon which railway companies are more anxious than to find some means of satisfying the public that their safety is provided for to the very utmost. We have had meeting after meeting, in fact, there is a standing committee of railway managers meeting occasionally now; but we have been quite at a loss what means to devise.

13,549. In fact, you consider that the best means for securing the safety of the public is to leave the full responsibility upon the managers of the company?—I believe that. At the same time I, for one, have always said that we should be exceedingly glad to see the Board of Trade make some suggestion as to what we should do.

13,550. In fact, the Board of Trade learns more from the railway companies than the railway companies do from the Board of Trade?—I would not say that. It learns no doubt from the railway first, but we find that the Board of Trade inspectors know a great deal. But they themselves, of course, like the railway managers, see the difficulties of the case; and I think I may say they decline to lay down any rule as to what the railway companies should do.

13,551. (*Mr. Gower.*) You do not think that the pointsmen are overworked?—I do not believe that as a rule they are. I do not know what it may be upon all railways, but certainly upon our own line, and on the lines in connexion with us, it is a subject which we have frequently had under consideration, and in fact, have regularly inquired into, and I believe that the pointsmen are not overworked.

13,552. (*Mr. Hamilton.*) Is it not the fact that accidents have generally occurred not at the points of the greatest traffic?—Yes, not from the pointsmen generally, and not always at the points of the greatest traffic. The pointsmen, as a rule, have 11 hours by day, and 13 hours by night, when their duties are light; when their duties are heavy, then they have eight hours. Take any important junction where a man has to attend continuously to the signals and to the points, there we give him only eight hours.

13,553. Is there not any reduction in the number of hours employed, in consequence of the inquiry that has been made upon the subject?—We have made no alteration, and recently the men have been agitating for more wages, but no alteration has taken place as far as we are concerned, either as to wages or hours. Our pointsmen get, I think, from 21*s.* to 23*s.* per week, and they get two suits of clothes a year, and 5*l.* bonus if there is no complaint against them.

13,554. (*Capt. Galton.*) That is a very good rate of wages, is it not?—Yes; they are a very important class of men. I do not say that it is by any means too much, but it is a good rate of wages for working men of their class. As to improving the class of men, and putting a higher class of men to those duties, I say that that would be quite a mistake; in fact, as I once said to a Government Inspector, if you put a high class of men at the points, I should almost decline to travel in the train. The company want a pointsman who will think of his duty and almost nothing else. If you get men of a superior class, for instance of the class of clerks, you would get them reading, and you would be certain to have an accident. Some of the very best men for that duty are men who can scarcely more than read and write, and who think of nothing else but their work, although as a rule no railway companies employ men who cannot read and write.

I understood that it would be desirable to lay before the Commission the rates that have been charged by canal between London and Birmingham, London and Manchester, Birmingham and Manchester, and South Staffordshire and Liverpool, prior to the opening of the railways, and I have had tables prepared to show that.

The witness handed in the following tables:

RATES, LONDON and BIRMINGHAM, by Canal in 1836; by Railways and Canal in 1842; and by Railways in 1866.

* Grain rate includes collection in Liverpool.

13,555. (*Chairman.*) Were they generally higher or lower than the rates at present?—In no case are the present rates anything like so high.

13,556. (*Mr. Hamilton.*) What is your object in putting in those tables?—I did not intend to put them in, but from a remark which was made the last time I was examined, that it would be desirable to have that information.

13,557. It is a well known fact that the public pay less now for their traffic than they did before the institution of railways?—Yes, we know that very well.

J. Grierson, Esq.

27 Feb. 1866.

and I think the public know it also. Take, for instance, from London to Birmingham, the rates for iron before were 25*s.*, they are now 15*s.*; for damageable iron they were 27*s.* 6*d.*, they are now 17*s.* 6*d.* I will just draw attention only to one column, which shows the rates that were charged by the carriers over the railways before the railway companies were carriers. You will see that on the railway between London and Manchester the carriers, who were not controlled by Act of Parliament, charged 61*s.* 8*d.* for a certain class of goods, whereas now the charge is 28*s.* 4*d.* when the railway companies carry, and all the other rates are in proportion.

13,558. (*Chairman.*) Are there any additions which you would wish to make to your evidence on any other point?—No, I think not.

The witness withdrew.

Capt. H. W. Gordon, C.B.

Captain H. W. Gordon, C.B., examined.

13,559. (*Chairman.*) You are superintendent of Her Majesty's stores at Woolwich?—Yes, principal superintendent.

13,560. Is it a matter of great importance that you should have the means at all times of promptly forwarding all descriptions of warlike stores direct from the Royal Arsenal to all out stations, more particularly to the naval outposts, such as Portsmouth, Devonport, and Chatham?—It is.

13,561. Is it the fact that, although you are now in actual communication with Portsmouth and with Devonport, the South-eastern railway will not undertake delivery or prompt action beyond the limits of their own line?—It is.

13,562. And, therefore, in practice you do not forward your stores by the South-eastern railway?—We do not.

13,563. Is there any Act of Parliament by which you can compel a railway company to use all reasonable diligence in forwarding your stores?—I am not aware, but I believe that they are compelled to do so as far as their own line is concerned, but they do not exercise any control over other lines with which they may be in connexion.

13,564. Have you had any communications with the other railway companies over whose lines stores would have to be forwarded?—None whatever, excepting with the South-eastern railway.

13,565. (*Capt. Galton.*) Do you make arrangements with the company or with the carriers?—Solely with the carriers.

13,566. And you leave the carriers to make their arrangements with the different companies?—Certainly.

13,567. (*Chairman.*) Do you know whether Messrs. Pickford and Company have attempted to make any arrangements between the South-eastern and other railway companies, in order that the stores might be carried without loss of time over the different lines?—I do not.

13,568. Do they always, in practice, carry the goods to London?—Always; I may say they invariably do so, in preference to using the line of railway with which we are connected.

13,569. (*Mr. Glyn.*) Did you never apply to the South-eastern Company to give you a through rate to Devonport?—The South-eastern Company are in connexion with the South-western, but they will not undertake anything further than the limits of their own line.

13,570. Did you ever apply to them to make a through rate?—I applied to the traffic manager, Mr. Eborall, and he answered me to the effect that they could not be responsible beyond the limits of their own line, and could not undertake to deliver beyond its limits within a reasonable time (*copy of letter annexed*).

South-eastern Railway, London Bridge Station,
11th December 1865.

Sir,

Referring to your communication of the 14th September, I beg leave to acquaint you that inasmuch as this Company are not the proprietors of the railway throughout, from Woolwich to Portsmouth, I find there will be some difficulty in giving the guarantee for the delivery of the stores sent one day from Woolwich, on the following day at Portsmouth, and I could not recommend the directors under the circumstances to enter into such an arrangement.

I am, &c.
(Signed) C. W. Eborall,
General Manager.

Captain Gordon,
Military Store Office,
Woolwich, S.E.

13,571. (*Capt. Galton.*) It is not so much the question of charge that you complain of, as the delay which takes place in the delivery?—It is the delay. If, for instance, I wanted to send a gun to Portsmouth to-morrow, the South-eastern Company would not undertake to deliver it the next day at Portsmouth, they would only undertake to carry it as far as their own line went.

13,572. How long would they take to deliver a gun at Portsmouth?—If we sent it by Messrs. Pickford to Nine Elms, it would only take 12 or 14 hours.

13,573. And if you put it on a South-eastern truck, which truck goes into the arsenal, it would take longer than that, would it?—We have no security when it will be delivered.

13,574. (*Mr. Gower.*) Have you not the same power against the South-western Company that you have against the South-eastern?—We have no power against either.

13,575. (*Capt. Galton.*) They are bound, are they not, to convey military stores at a certain charge per ton per mile?—They are; but our agents, Messrs. Pickford and Company, make their own arrangements with the companies.

13,576. (*Earl of Belmore.*) Do they make a special arrangement every time?—No; we have a regular contract with them, running throughout the year, to convey goods whatever they may be.

13,577. You have a contract with Messrs. Pickford, and Messrs. Pickford have to make their arrangements with the companies when they find it necessary to do so?—Yes, quite so.

13,578. (*Chairman.*) Are there no special provisions in any Act of Parliament which allow the arsenal authorities to call upon railway companies to forward stores to any part of the country without delay?—None that I am aware of.

13,579. Do you think that any alteration of the law is desirable in that respect?—The Government should be treated the same as any private party, except in the conveyance of gunpowder and combustibles, and with regard to those articles, I think it is most essential that railway companies should be compelled to convey them whenever they were called upon to do so by Government officers, more especially in time of war or emergency.

13,580. (*Mr. Glyn.*) Do you remember some years ago a Commission being appointed, composed of certain authorities at the Horse Guards and some of the managers of the leading railways, to go into the question of the conveyance of troops and military stores upon the railways?—I have heard of it.

13,581. In consequence of the report of that Commission, was not an Act of Parliament brought in for the regulation of the traffic of soldiers and military stores upon railways?—I do not think so.

13,582. Was there not a certain understanding arrived at between the principal railway companies and the Horse Guards upon that point?—I believe that there was an understanding as to the conveyance of troops and stores accompanying them; but nothing

with regard to munitions of war which would be sent for reserve, or would be sent independently of troops.

13,583. In consequence of the report of that Commission, did not some companies, certainly the London and North-western, provide what was necessary for the conveyance of gunpowder upon the line?—They provided trucks, and most lines have gunpowder trucks; but some companies will only convey it once or twice a week. No companies will undertake to deliver it, except upon certain days which they have laid down themselves, and in case of emergency this is most inconvenient.

13,584. (*Earl of Belmore.*) As a general rule, do they send trucks containing munitions of war by special trains, or do they attach them to their ordinary goods trains?—They would be attached to their ordinary goods trains, except under certain circumstances when expedition might be required.

13,585. (*Mr. Hamilton.*) You say that in cases of emergency it might be inconvenient to have gunpowder only delivered upon certain days; has that inconvenience ever arisen?—Certainly, inconvenience has arisen. I have been obliged to send powder through London when I consider it ought to have gone direct by railway to Portsmouth or Southampton from the arsenal without going into the metropolis at all. But in the case that I mention now, namely, sending stores to Southampton for shipment, we have to send them to the Nine Elms station by vans, passing through London, instead of being put in a special truck inside the arsenal and taken the whole way without going through London at all.

13,586. Did you in that case apply to the railway company to give you a special day?—No; I allude to this transaction in connexion with the South-eastern railway not guaranteeing delivery the next day at the station to which the stores are consigned.

13,587. (*Chairman.*) Is it a matter of frequent occurrence that you have to send stores to Portsmouth or Devonport?—Very frequently, especially at this time when most important experiments are being carried on on board the "Minotaur" with guns, which affects our manufacturing arrangements and expenditure of money, as I cannot send a gun to Portsmouth in consequence of the South-eastern and South-western companies having no trucks capable of conveying it; they cannot take anything above eight tons, whereas this gun weighs 12 tons, and therefore it has to be sent by water, which causes very great delay.

13,588. It would be hardly reasonable, would it, to expect railway companies to provide those trucks unless they were paid something extra for the use of them?—The Great Northern and the London and North-western companies have trucks capable of conveying 30 tons.

13,589. Do they use them in their regular traffic?—Yes, in their regular traffic.

13,590. Do you know for what description of goods?—For boilers and engines; and the heavy guns from Elswick all come by railway to King's Cross, and then they come by water to the arsenal.

13,591. (*Mr. Hamilton.*) But those two railways are connected with manufacturing districts, and they are likely to have a demand for powerful trucks of that description, whereas in the case of the South-eastern Company they would have no such demand?—No; but in this case I think we should have a truck ourselves.

13,592. (*Chairman.*) Would a railway company object to your providing trucks of that sort for yourselves and keeping them in the sidings?—I do not imagine that they would object, as they would be kept in the arsenal.

13,593. (*Mr. Glyn.*) Have you made any application to the South-eastern Company since they have made a communication with the South-western in London?—Yes; quite recently I made this application, in consequence of what occurred when Her Majesty embarked at Woolwich. I saw a director there, and he wished me to do it. I wrote, and they sent me an answer that they could not guarantee prompt delivery.

13,594. (*Chairman.*) Have they refused to make any communications with the railways over which it would be necessary for the stores to pass?—They decline to guarantee delivery within a reasonable time.

13,595. Do you know whether any communications have passed between the different railway companies on the subject?—I am not aware.

13,596. (*Mr. Gower.*) Has the South-western Company refused to guarantee the direct transit of the stores?—No; but then we convey the goods to their line, and they go direct to the place where they have to go to, and do not leave the line at all; we take them to London, and they convey them on.

13,597. (*Chairman.*) There are two objections, are there not, to the present mode of conveyance, the first is, that you have to bring the powder and stores through London, and, next, that there is a considerable delay, and that the goods are not delivered as quickly as they might be if they were conveyed at once from Woolwich?—No, that is obviated, as our agents take them to the station in London.

13,598. Is that as rapid a mode of conveyance as it would be if they were taken by rail the whole distance?—I think it is quite as rapid, but it is more inconvenient.

13,599. (*Mr. Hamilton.*) What remedy would you propose for this inconvenience which you experience at Woolwich?—That the South-eastern Railway Company should guarantee, as far as is in its power, to deliver any stores within a reasonable time at the place to which they were intended to go.

13,600. You delivering them to the railway?—Quite so.

13,601. As I understand, you deliver them to one railway company, and wish another railway company to guarantee that they shall be delivered at a particular time?—I wish goods to be sent the same way as I should expect to travel myself, that is to say, if I take a ticket at a station connected with two or three lines of railway, for the place that I am going to, I should expect to be conveyed by the different trains taking me on.

13,602. But you cannot take a ticket from the station at Woolwich now, and book yourself to Portsmouth?—No, I cannot; but there are many places where I could under similar circumstances; it is not exactly the inconvenience I complain of, but that the railway company refuse to guarantee to deliver stores within a reasonable time.

13,603. And the reason is, that the railway connected with Portsmouth, and which runs into Portsmouth, is not the railway to which you deliver the goods?—Quite so.

13,604. What is the remedy for that?—I do not know what the remedy would be, except by mutual arrangement between the lines.

13,605. (*Mr. Gower.*) Does the South-western Company refuse to carry your goods?—No, not at all.

13,606. You cannot expect the South-eastern Company to guarantee delivery beyond its own line, can you?—I think if I send a parcel to the South-eastern Railway Company, as any private person might do, and they take it, they do guarantee its delivery at the place where it is directed to.

13,607. Although it is beyond their own line?—Yes, I think so. I think they would be responsible if they took it.

13,608. (*Earl of Belmore.*) Is it your complaint that those two railway companies will not make a through rate?—No; but that they will not guarantee reasonable expedition.

13,609. But one depends upon the other, and if they make a through rate they would be responsible for quick delivery, would they not?—I suppose they would.

13,610. (*Chairman.*) Do you know whether they book through any other description of goods for private traders from the neighbourhood of Woolwich for Portsmouth and its neighbourhood?—They will take a parcel and deliver it. I conclude if they take a parcel and book it, they are responsible for delivering it.

13,611. (*Mr. Hamilton.*) What I understand you

Capt. H. W. Gordon, C.B.

27 Feb. 1866.

to mean is, hat they should guarantee expeditious delivery?—Quite so.

13,612. That would imply that the South-eastern should have some power over the traffic of the South-western railway?—That there should be some mutual arrangement.

13,613. (*Mr. Glyn.*) I do not understand you to say that you require more expedition than would be given to any particular quantity of goods, but all that you require is that if you consign goods to them at Woolwich you shall have them down at Portsmouth according to the regular custom of trade?—Quite so.

13,614. (*Capt. Galton.*) How do you send goods to Sheerness, for instance?—Generally by barge.

13,615. (*Mr. Glyn.*) I suppose you would say that Government stores ought in fact to have the preference in conveyance on the part of railway companies rather than otherwise?—I certainly think so.

13,616. (*Capt. Galton.*) Do you provide special powder vans?—No, the companies provide special powder vans; at least most lines do, but some, I believe, have none at all.

13,617. Where there are not special powder vans do they refuse to carry powder, or do they carry it in ordinary goods vans?—There are no specific arrangements; some lines will take it twice, and others will only take it once a week.

13,618. (*Chairman.*) What would be the route that stores would take from Woolwich to Portsmouth; would they go to London if they went by rail that way?—No, they would take a circuitous route, they would go to Guildford on the South-western line, or else they would they would go by the London, Brighton, and South Coast line.

13,619. (*Mr. Hamilton.*) Why should they do that, considering that they have now actual railway communication between London Bridge and Waterloo Bridge?—There is no goods traffic communication between London Bridge and Waterloo Bridge.

13,620. (*Chairman.*) Are you of opinion that all railway companies should, on receiving 24 hours' notice, be prepared and compelled to convey powder or ammunition to any place that they may be required to convey them?—I am; and in case of war or tumult they should be compelled to convey them whenever required at any time by competent authority.

13,621. (*Capt. Galton.*) You have great difficulty, have you not, in sending stores which are required for the life-boats now?—Yes, very great difficulty, as well as in sending any combustible stores. I do not mean difficulty, but expense.

13,622. When they convey stores for the life-boats only, do they charge a very high price for them?—They do. For instance, for the carriage of 10 rockets for life-saving apparatus to Aberdeen, the Board of Trade was charged somewhere about 20*l.*

13,623. Could not you send them by steamboats?—The supply of life-saving apparatus is very pressing. A demand for rockets is often received requiring them to be sent off at once; we have not the means of sending them expeditiously by water, and we are obliged to send them by rail.

13,624. (*Mr. Hamilton.*) What would be the weight of those rockets?—They weigh 12 lbs. a-piece—120 lbs.

13,625. Was that the whole weight of the package that you sent to Aberdeen?—It was; the Board of Trade had to pay the same as for two tons of gunpowder at 8*d.* a mile, on account of there being no classification of combustibles in the same way as there is for other railway traffic; although those rockets would not be nearly so dangerous to convey as oil or turpentine, or such like inflammable articles, or at least hardly more so; they would require a light to be applied to them to ignite them.

13,626. (*Capt. Galton.*) In the event of a collision might there not be an uncomfortable accident with the rockets in the luggage van?—No, it would require fire to ignite them.

13,627. Would not a blow do it?—No, they are not self-igniting.

13,628. (*Chairman.*) Do the railway companies convey gunpowder at 4*d.* per ton per mile?—Yes, but not less than two tons to be sent at a time. Therefore if we were to send 1 lb. of powder, it would be charged as two tons. (*See conditions of contracts annexed.*)

TERMS and CONDITIONS of a CONTRACT for the CONVEYANCE of AMMUNITION made between Her Majesty's Principal Secretary of State for War and the Railway Company.

To Her Majesty's Principal Secretary of State for War.

SIR,

I HEREBY engage on behalf of the railway company to perform such services as are enumerated hereunder at the price named, and I do hereby agree to abide by and fulfil all the terms and conditions herein named.

1. The articles comprised under the head ammunition are such as tubes, fuzes, signal rockets, port fires, quick-match, blue, percussion, and long lights, powder, rockets, filled shells, gun and small-arm cartridges, with percussion caps.

2. Combustible stores to be carried by the railway company only in metallic cylinders, or in gunpowder vans.

3. The charges to be station to station, as follows:—

1. When in metallic cylinders:—One ton and upwards 6*d.* per ton per mile, below one ton ½*d.* per cwt. per mile; but the charge for a quantity below one ton not to exceed the charge for one ton.
   The minimum weight to be three cwt., and the minimum charge 5*s.*
2. When carried in gunpowder vans:—4*d.* per ton per mile; minimum weight, two tons; minimum charge, 20*s.*

4. Returned empties to be charged for according to the ordinary scale in operation for the return of empty packages.

5. The ammunition to be conveyed at the risk of Government.

6. The ammunition to be conveyed to the premises of the railway companies by the war department or the troops, as the case may be, but (except in London, where companies having termini in London will make their own charge) the railway companies will effect the delivery at the rate of 2*s.* 6*d.* per ton, with a minimum charge of 1*s.*, within the usual limits, and the ordinary additional rate for extra distances; the servants of the company to assist in loading the ammunition.

7. If the collection of the ammunition at the barracks or military station be required, the expense of such collection shall form an extra charge according to the distance.

8. The metallic cylinders used for packing the ammunition shall be legibly painted or marked "powder magazine."

9. This contract to continue in force from the date of acceptance, until terminated by three months previous notice being given by either party.

Dated this day of 186 .

Witness Signature
Address Address

Acceptance.

I hereby, on behalf of Her Majesty's Principal Secretary of State for War, accept the above tender, and agree to pay the sums to grow due thereon, according to the terms of contract.

Dated this day of 1865.

Director of Contracts.

13,629. Do you think that there should be a new classification of combustible stores?—I do. In the same manner, as all railway companies have various scales of prices for the conveyance of stores, charging more for oils and other inflammable materials, so should the same rule obtain with combustibles, which may be divided into two distinct classes, viz., those that carry ignition in themselves, and those that require the application of fire to ignite them, and these classes may be again divided into others. The first into two, namely, explosive and non-explosive; and the second into three, namely, explosive, incendiary, and non-explosive. The explosive of the first class would be represented by shells filled with powder and with percussion fuzes in the fuze holes, or by small arm ammunition of a self igniting character. The non-explosive, on the other hand, would be confined to friction tubes and percussion fuzes. The explosive

of the second class would be comprised in gunpowder, filled shells without fuzes, and small arm ammunition made up without caps. The incendiary, of rockets of all kinds, whether signal, life saving, or war, as well as of fireworks generally, that is to say, that after they were lit they would fly about and set other articles on fire, although they would not explode. The non-explosive would be represented by common fuzes, quick match, port-fires, long and signal lights, light balls, carcasses, and tubes requiring fire to ignite them.

13,630. (*Capt. Galton.*) But railway companies object to such a classification, do they not?—I do not think so. I believe that our agents, Messrs. Pickford, send combustible stores and the companies do not object. I believe gunmakers send their ammunition by railway just the same as other packages without ever declaring it at all.

Capt. H. W. Gordon, C.B.

27 Feb. 1866.

13,631. Have you ever sent a gun by railway?—Yes.

13,632. How long does it take?—It takes a long time, on some occasions.

13,633. For instance, three or four days, perhaps?—It would take three or four days sometimes, and this is very inconvenient, especially when experiments are going on at Portsmouth, and when it is most important that it should be delivered with the utmost expedition.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Thursday, 1st March 1866.

PRESENT:

The Right Hon. The Earl of Belmore.	Geo. Carr Glyn, Esq., M.P.
The Right Hon. Lord Stanley, M.P., F.R.S.	Capt. Douglas Galton, R.E., C.B., F.R.S.
The Hon. E. F. Leveson Gower, M.P.	E. T. Hamilton, Esq., M.P.
Sir Rowland Hill, K.C.B., F.R.S.	
T. B. Horsfall, Esq. M.P.	William Pole, F.R.S., *Secretary.*

His Grace THE DUKE OF DEVONSHIRE, K.G., F.R.S., in the Chair.

James Allport, Esq., further examined.

J. Allport, Esq

1 Mar. 1866.

13,634. (*Chairman.*) You wish to make some additions to the evidence you gave on the last occasion?—Yes; since I was here some additional evidence has been given as to the coal traffic of the Midland Railway. I have received a memorial that was sent from the Wingerworth colliery proprietors. Unfortunately I have not had much time, as I only received it this morning from Derby, to go into all the particulars. They state, "The railway companies (almost all of "them, and particularly the Midland, and London and "North-western), require the coal merchants or coal "masters to provide waggons for the traffic." That is perfectly true. When the coal trade was first established on railways, the coal owners preferred finding their own trucks, and that has continued; so far from being compelled to do so, it was only yesterday morning that I was talking to one of the largest coal merchants in the kingdom, and suggested to him the propriety of the railway companies buying the trucks; I know that several of them positively refused, and if they bought them it would be but partially done, for many of the coal owners would still prefer to find their own, and it would scarcely do to have a double system. My view decidedly is in favour of the companies finding the trucks, the work would be done at much less cost, and much fewer trucks would be required for the purpose.

13,635. (*Capt. Galton.*) Why do you think that they prefer finding them for themselves?—Because they have them so entirely under their own control; they think they get more work out of them, but I think the opinion is not shared universally by them. To take the Clay Cross Company, and two or three other companies, the Staveley Company, who are large coal owners on the Midland line, they would prefer the railway company finding the trucks, but unless it were done generally, I do not think it would work well. The Commission, however, I think will see that it would simplify the work; we get a train of 50 empty coal trucks consisting of the trucks of 25 or 30 owners, and these are mixed together, having been picked up at various stations; they are in great confusion, but they must stop somewhere upon the line to be shunted. You cannot leave one man's truck at another man's colliery, but if all the trucks belonged to the railway company, then we should merely leave a certain number, according to the requirements of that colliery, and I think it would be better for the trade generally.

13,636. You think you would use a much smaller number of trucks altogether?—Yes. It often happens that one or two collieries are very busy, and they cannot find a sufficient number of trucks, while other collieries may have but little to do, and if the railway company owned all of them, that state of things would be remedied.

13,637. There would be a sort of average number required?—Yes. At the present time I believe we have 20,000 or 22,000 trucks belonging to private owners on the Midland Railway

13,638. What diminution in the number of trucks employed, do you think, could be made if the whole of them were owned by the railway company?—Fewer certainly, perhaps one-fourth less, and that would be a great assistance to the companies; it would also save a great expenditure in sidings and for shunting. At two or three places on the Midland line we have laid down a system of sorting sidings. We have one set on the Erewash Valley line, and I suppose at that place we have 15 or 16 miles of sidings. At a place called Chaddesden, a mile and a half out of Derby, we have 14 or 15 miles of sidings, and a considerable part of those would be saved if the trucks belonged to the railway company instead of to the various private owners.

13,639. (*Mr. Glyn.*) Have you calculated how many trucks you would require for the whole of the traffic?—I cannot speak positively about it, but I think where we have from 20,000 to 22,000 on the Midland Railway, we could do with certainly one-fourth less, if not more. I have been long of opinion that it ought to be done.

13,640. (*Mr. Horsfall.*) I think you have stated that the trucks carried six tons each?—The older ones were made to carry about five tons, but they have gradually increased in size, and they now carry five, six, and eight tons, and even up to ten tons.

13,641. (*Chairman.*) Ten-ton waggons, I believe, are by no means uncommon now?—No. I do not think it is the best form of waggon, because I think it is too great a weight upon two axles; they are not so convenient to work as six or eight ton waggons.

13,642. (*Mr. Horsfall.*) Originally, I believe, you only allowed waggons to carry four tons?—The ordinary goods waggons were limited to four tons, and if it was so originally with coal waggons it must have been many years ago.

13,643. When you subsequently allowed them to carry more tons per waggon, did you require the axles to be altered?—We never had any restrictions of that kind. We allowed the coal owners to put trucks upon the line to any extent they pleased, not exceeding seven tons. I am not positive about that, but of course a

J. Allport, Esq.
1 Mar 1866.

seven-ton waggon would require a stronger axle than a four-ton waggon. I have no recollection of any alteration being made in the waggons carrying four tons.

13,644. A complaint has been made to me that originally you would only allow four-ton waggons, and that you subsequently required the Wingerworth Company to alter their axles, while at the same time you allowed the Staveley Company to run with their old waggons?—I entirely deny that it is so; such a thing has not occurred since my connexion with the Midland Company, or since 1852.

13,645. Are you satisfied that it is not the fact?—I am quite certain of it. Whatever regulation might be in force would be applied to the whole of the collieries alike both before and since my connexion with the Midland Company.

13,646. How long are you in taking coals from Clay Cross to Derby?—I think about an hour and a half.

13,647. I have a statement before me in which it is said from Clay Cross that the length of time required for delivery in Derby varies from two to six days?—It is quite impossible.

13,648. In December?—I think it is a pity that the Wingerworth people did not send this to me, to enable me to test it, for I unhesitatingly say that this is not a true statement. It would be impossible for the Midland Company to carry on their traffic if there was any foundation for such a statement. We have now from 130,000 to 140,000 tons a week, and without the greatest system of regularity and care we should get into confusion. This I can assure the Commission, that no complaint of this kind has ever reached me from the Wingerworth Company, and I was very much astonished to receive a copy of the memorial through the secretary this morning, but I should be very glad to test this identical paper which I have had handed to me.

13,649. I think it is very desirable, because the gentleman who forwarded it to me I know to be a person of great accuracy in his statements?—I will look into it, and this brings me to a point that I was going to allude to in this evidence, and also in the Nottingham evidence. The railway company has no control over these coal waggons, and the consignment of the coal traffic is altogether different from the goods traffic. The goods traffic we load and unload, and we dispatch the waggons at our own time; we receive them at our stations by our own servants, and we handle the goods entirely, and as long as they are upon our premises. But with the coal traffic it is not so; the waggons are loaded by the coal owners and brought to us at a siding; they are consigned to their own people and we know nothing of them, and all we do is to carry the trucks from Clay Cross to Derby or any other station. They are then put into sidings, and there is no doubt that the consignees are very frequently detaining these trucks, and that is one of the great sources of inconvenience to us, so much so that we have been obliged to charge siding rent, if they have been kept beyond a certain time, and we have done so to prevent the stations being entirely blocked up. But to say that trucks would be two days or five days going from Clay Cross to Derby, a distance of 20 miles, is simply an absurdity.

13,650. (*Mr. Glyn.*) They use your sidings as depôts?—Yes; and we have really no control over the trucks until they come upon our line, nor from the time that they are put into the sidings at their destination.

13,651. (*Capt. Galton.*) Referring to the waggons again, if it would save a third of the number of waggons you use upon the line, and also a very large amount of the working expenses in conveying the trains and in sidings, is it not worth your while to offer terms to the colliery owners which would induce them to give up their waggons into your hands?—It has grown into such a large question now that it is a very difficult thing to deal with the waggons upon the Midland Railway, and would probably involve an expenditure of a million sterling.

13,652. For the purpose of purchasing those private waggons?—Yes; in round numbers, if there are 20,000 waggons probably worth 50*l.* apiece, that would be exactly a million, so that it has really become a most serious question to deal with.

13,653. If you could use that number of waggons to carry a third more trade than you now carry, or half as much again as you now carry, would it not be worth your while to offer favourable terms to them to give up their waggons?—We allow the colliery owners now a certain sum per ton for finding the waggons, about 9*d.* per ton, and that is a very liberal allowance; it is very likely that we might be able to make an alteration, but I do not think it would amount to any per-centage per ton. The quantity now carried is so large, upwards of six millions of tons, that the saving would be such as to be a very small per-centage per ton.

13,654. If two waggons did the work of three there would be a great saving?—Yes.

13,655. How many tons does a waggon carry in a year?—I cannot tell how many tons the coal waggons carry; our goods waggons will carry, I suppose, from about 400 tons a year to 500 tons.

13,656. That is getting more work out of them than most railway companies do?—I think we do. I have had to compare notes with several large railway companies, and I have found our waggons earn more money per annum than on most of the other railways. I may state that in the numerous collieries on the Midland Railway, amounting I suppose now to 200, I do not think that the coal owners would make, except the Wingerworth Company, such a charge as that against the Midland Railway Company, but on the contrary. During the late autumn, when there is always a great press of business, our trade has been stopped at various junctions by other companies, and in no single instance have we ever delayed a train or waggon of coal that I know of during the entire autumn or winter up to this day.

13,657. (*Mr. Horsfall.*) You may not be aware of the fact, but if you will observe in that statement the number of the waggons is given, and the date when the delay took place, and you will have ample opportunity of testing it?—Yes, I shall be able to trace every waggon, and I shall be happy to do so, and furnish the Commissioners with the result.

13,658. I think you stated that no complaint had been made to you as to these delays?—Yes.

13,659. If you will look at this letter of your own (*handing the same to the witness*), you will see that complaints have been made?—This is dated September 29th 1864, and I should remark upon this that at this time, and for a considerable period of time in 1865, as no doubt the Commissioners must be aware, there was a strike in Staffordshire among all the colliers, so that the entire of Staffordshire was out of work. This threw such an immense amount of work upon the Midland Railway Company, and upon the collieries in Derbyshire and Nottinghamshire, that the receipts from the coal traffic alone for many months averaged between 3,000*l.* and 4,000*l.* sterling more than in the corresponding period in previous years, and that will show the enormous amount of work that was thrown upon us, and we had the greatest difficulty in getting this coal carried away into Staffordshire; we do not go into Staffordshire ourselves, and I can quite understand that in October 1864, and in January 1865, this might have occurred, if this applies to that date.

13,660. It applies to last December?—It does not say the year.

13,661. I think the inference is that it is so?—I question it very much; the last letter is January 21st, 1865. I observe in one of my letters I say, "I have had an "inquiry made into the subject of your note of the "26th ult., and find that the accident in question was "caused by the defective condition of the draw bar of "one of your waggons, which I learn had just been "welded."

13,662. I do not produce this to show that your justification is not a good one, but because you said you had had no complaint?—I thought you said December; my mind was running upon December 1865, and this is December 1864, more than 12 months ago,

if this refers to that period, I at once withdraw what I have stated, but if it refers to December 1865 I do not think there is any truth in it. I am very glad I have seen the dates.

13,663. (*Chairman.*) You think it is very probable that the waggons of the coal owners are detained a considerable time in the sidings?—Yes, they are, very much indeed.

13,664. But that is owing to circumstances over which you have no control?—Yes; the memorial goes on to state that "the railway companies sometimes "delay them five or six weeks;" that delay is caused as I state, and we are constantly pressing upon them to empty the waggons; they are not delayed by the company. Then they say, "and at other times smash them up "in shunting, and refuse to pay compensation, alleging "the damage to be caused by wear and tear." Our system is this, if a waggon fails from being made of defective material, or from ordinary wear and tear, and is damaged, we send it back to the colliery naturally to repair it, but if it is damaged from any fault of the company we invariably repair it and send it home. If a waggon is a Clay Cross waggon, and breaks down and damages, from defective material, half a dozen waggons belonging to the Staveley Company, we should repair the Staveley Company's waggons and return them without any charge, but we should not repair the Clay Cross waggons having caused the accident. If we damage any waggons by our servants we invariably repair them, and we pay large sums every year for the repair of these waggons; in a great measure it is caused in this way, one colliery owner's waggon is damaged by another colliery owner's waggon failing.

13,665. (*Capt. Galton.*) You call upon the coal owner whose waggon fails to repay you?—Never.

13,666. (*Earl of Belmore.*) When a private owner puts a new waggon on to the line, do you have any inspection made of it to see that it is not defective?—We do; we do not say that it shall be made of any particular dimensions or material, but we examine it to see that it is a safe waggon and fit to run; we do not put any restriction upon the construction of a waggon.

13,667. But you do put a restriction upon the number of tons it has to carry?—Not up to 10 tons.

13,668. (*Chairman.*) Have you many disputes with the colliery owners about the breaking down of waggons?—We have had one or two with the Wingerworth Company; we have had many disputes with that company as to their waggons, and we have had probably more than with any 20 collieries put together on the Midland Railway, and it arises partly from the weak construction of their waggons. Unfortunately there is a heavy incline, a self-acting one, over which the waggons have to be worked. We frequently have the chains and couplings break, and the waggons run adrift and they are very much broken, but at other times a sudden snatch will break the rope on the incline, and when the rope breaks or anything occurs to the machinery we invariably repair the waggons, but we do not do so when they fail from defects in the waggons themselves.

13,669. (*Mr. Glyn.*) Is that their own incline?—No; it belongs to the company.

13,670. (*Mr. Horsfall.*) You say that the Wingerworth waggons are more weakly constructed than the waggons of any other company?—No; I did not say that, but owing to this incline, I said that we had had more complaints from them than from any other.

13,671. I have a letter here of yours, dated 14th November 1865, in which you say, after alluding to the damage, "However, as the work is not now so "heavy, and I find we shall be able to clear your "present traffic by running down four waggons each "journey, arrangements have been made for this to be "done;" evidently showing that the complaints have been made so recently as November last?—That is damage to the waggons in consequence of a press of business, and at their own request we ran, I think, five waggons instead of four for the sake of getting through the business. My letter alludes to reducing the number, the press of business being over. I said that we should reduce the number of the waggons; and that was entirely to avoid breakage.

13,672. It appears to have reference to the damage. Then the intermediate portion of the letter appears to have reference to another complaint, because you go on again to refer to the damage?—It all refers to the damage. I say, "I have had inquiry made "into the subject of your note of the 26th ult., and "find that the accident in question was caused by "the defective condition of the draw-bar;" this is exactly what I stated, "There does not appear to be "any ground for the supposition that the breaks were "applied too suddenly; nor do I think that under ordi-"nary circumstances, there is any danger in running "five loaded waggons down the incline at a time. "However, as the work is not now so heavy, and I "find we shall be able to clear your present traffic by "running down four waggons each journey, arrange-"ments have been made for this to be done. With "regard to the damage the waggons sustained in conse-"quence of the accident, I must at once decline to "admit any liability on the part of the Company in "respect to them, as I do not consider our people at all "to blame in the matter." It all refers to what I have stated, the draw bar causing the waggon to give way.

13,673. (*Chairman.*) I suppose you are the sole judges of the cause to which any damage is attributable?—If there is any dispute we always invite them to meet one of our inspectors on the ground, and if they agree as to the cause of the accident, and say that it is the fault of the Company, we pay for the damage without a moment's hesitation.

13,674. Is it the fact that the Midland Company charge 5*s.* 4*d.* per ton from Clay Cross to Grantham, when they charge only 4*s.* 4*d.* by the South Yorkshire to collieries coming on to their line at Swinton, which is 20 miles farther off than Clay Cross?—I have not our rates with me.* Coals coming on to the Midland at Swinton, come from collieries on the South Yorkshire Railway, and a through rate is the charge made, and that should be taken into account in the Midland proportion. I am not prepared to say that that is the Midland proportion of the through rate; but this I will say, that there is no charge made for coals north of Clay Cross, where the Wingerworth coals come on at a less gross sum than the Clay Cross Company is charged; not a single instance. The South Yorkshire Company require a considerable toll; that is added to the through rate, and the total charge is made up; the object being to put all the coal owners in a position to compete with each other. If we were not to do that the more distant collieries in Yorkshire or Derbyshire could not compete at all; take, for instance, the London market. The entire coal trade of London by railway would be confined to a few collieries—the nearest; whereas by graduating our scale, and still keeping a higher gross charge for the longer distance, we enable nearly all the collieries, from one end of our line to the other, to come to the London market, and every other market. That is the system we have adopted, and I believe it is a sound commercial principle that would influence any tradesman in any branch of business.

13,675. There is also a complaint against your company for having refused to carry coals to Birmingham and Nottingham, unless it were confined to merchants of their own choosing?—I desire to go into that a little further, and I have got some papers connected with that matter since I was here last, but for the present if you please I will go to the memorial. The next paragraph states that, "Lower rates are given "to large collieries for gas coals and on quantities "which smaller collieries cannot raise; this is mani-"festly unjust to small colliery owners." With regard to gas coal we make a reduction, and it must be a very small colliery indeed that cannot comply with our

* The following note was subsequently added by the witness:—Swinton is a common point to both the Great Northern and Midland; and as the Great Northern route to Grantham is shorter than the Midland, our rates are necessarily governed by those of the Great Northern.

J. Allport, Esq.
1 Mar. 1866.

requirements. I hold in my hand a circular which has been in existance for years, which I will read, "On "fly leaf hereof I hand you the rates that will be "charged, and the drawbacks that will be allowed "upon coal in owners' waggons from your collieries "for gas coal contracts of not less than 500 tons per "annum, or for not less than the whole annual con- "sumption of coal, where less than 500 tons is con- "sumed." Suppose a gas work can only consume 300 or 400 tons, then a drawback is given; but it is on gas coals, and it must be an exceedingly small colliery that could not raise 500 tons of coal per annum, or 5,000 tons, so that that complaint falls to the ground. Then we say, "When drawbacks are claimed certifi- "cates will be required signed by the manager or "secretary of the gas company, to the effect that the "coal has been used for gas purposes, showing date, "weight, and waggon number." That is the circular that the Wingerworth Company had, the same as any colliery upon the Midland Railway.

13,676. (*Sir R. Hill.*) Do all the collieries sending 500 tons per annum pay at the same rate?—They have the same drawback. We allow so much per ton drawback upon the total consumption of the gas works.

13,677. The first gross charge being a uniform one? —Yes. The certificate of the gas manager or secretary is required, and then we allow them a drawback of so much per ton.

13,678. The result of their sending so many as 500 tons per annum is, that they pay a net sum at the same rate per ton?—Yes; and in fact the circular does not limit it to 500 tons, for it turns out that in small villages they are now putting up gas works, and they do not perhaps use 500 tons, and we added to the clause to meet those cases.

13,679. Your expenses, I presume, are less in proportion to the quantity, that is, if you deal with a large quantity, and if you deal with a small quantity?—Yes. Gas coal generally goes in train loads, and they get it at a certain time of the year. The memorial states, "Lower "rates are given to large collieries for gas coals, and on "quantities which smaller collieries cannot raise; this is "manifestly unjust to small colliery owners." I presume there are two questions there, the large quantities of gas coals; but as I stated before, we have no separate charge for large or small quantities on the Midland Railway. The Clay Cross Company is the largest colliery probably on that railway, and the Wingerworth is a small one, but coming on at the same spot, the charges are precisely the same, except that in the case of the Wingerworth, it comes two miles further down this incline, for which they pay an extra mileage, but nothing for the extra expense of the incline. In saying that there was no differential charge made, I may observe that some few years ago an application was made to us to reduce our charge or give a rebate upon quantities going into the Eastern Counties district, and it was stated to us that if we would do that the trade would be very largely increased. We consented to give that rebate, provided a certain quantity was sent, but we said we will not give this rebate to the coal owners as it will have the effect of throwing the entire trade into the hands of certain large collieries. We prefer to give it to the coal merchant in the Eastern Counties district, and have a certificate from the manager of the Great Eastern Railway that those coals have been sent; and the result is that the gentleman whom I spoke to yesterday gets coals from many collieries on the Midland line, and if he gets 50 tons from Wingerworth, and 50,000 tons from Clay Cross, he would get a drawback on both alike; consequently the Wingerworth Company would be placed in the same position as the Clay Cross Company; but if we gave a rebate to the coal owners, the Clay Cross Company would get the rebate, and the Wingerworth Company would not. There is not the slightest foundation for the charges in the paragraph that I have read. Then it says, "An arbitrary charge is made "for siding accommodation and signalmen's wages at "some colliery junctions, while other collieries are not "required to pay any expenses of this kind." That is true to this extent; where we have sidings at a station, and where the ordinary staff at a station can work those sidings, we do not charge the coal owners, but we take the expense entirely upon ourselves. But where a siding is brought upon the main line between stations, and we are obliged to put up separate signals, and employ a man, we do charge; and that is uniform throughout the entire system. We endeavour to relieve the coal owners as much as we can from these charges, and latterly, in order to relieve them still further we have made an arrangement by which the Company take upon themselves half the expense of the signalman's wages in all cases; but it would manifestly be unfair to ask the Company to put in a siding, and put up expensive signals which certainly do not cost less than from 100*l.* to 130*l.* a year, including wages, and other expenses.

13,680. (*Chairman.*) Are there many instances besides the Wingerworth colliery where special signalmen are necessary?—I am not in a position to say that the Wingerworth Company do pay anything. I think that the Wingerworth Company pay nothing.*

13,681. (*Capt. Galton.*) I suppose there is a certain amount of traffic which would induce you to put in sidings and signals without charging anything?—No, we do not do that. That would be construed into a favour given to one colliery over another. A man would say, I do as much as I can, and it is not fair to charge me for signals when you do not charge another party. When the signals are at a station we do not charge, but when they are away from the stations we do. Knowing as I do well the Wingerworth incline, I am strongly of opinion that the Wingerworth Company pay nothing for signals at Clay Cross; but I will look into it.

13,682. (*Mr. Horsfall.*) Perhaps you will at the same time have the complaint as to delays tested, and inform the Commission of the result?—Yes. That, I think, exhausts the Wingerworth complaints, except Birmingham and Nottingham, and that will take me back to the Nottingham case. I have made it my business to inquire about the extra charge for coals which is stated to have been made in consequence of the change that we made about the middle of last year. I have three letters from coal owners, and I have five letters from coal merchants. I will read the coal owners' letters. The owners of the Hucknall Torkard Colliery say, "We have to acknowledge receipt of "letter from Mr. Tatlow of February 26th, addressed "to writer, respecting arrangements for coal traffic at "Midland Wharf, in Nottingham. With respect to "the statement that the restrictions on the number of "coal merchants there 'has caused a rise to be made "'in the price of coal sent from the collieries over the "'Midland line to Nottingham,' so far as we are con- "cerned, this and the empty waggons returned would "probably have led us either to refrain from sending "coal to Nottingham, or to have raised the price, so "as to have covered the loss of waggon hire, &c. We "think it is evident that what facilitates the trans- "mission of the traffic of coal must in itself be "admitted to be advantageous to the consumer, and "we are not aware of the existence of any cause in "the place to which we have been referring that is at "all likely to neutralize the benefit derived from a "restriction of the number of the coal merchants." I have another from Nottingham. "In reply to your "inquiry in reference to the sale of coal being "restricted to nine merchants at Nottingham station "having had the effect of advancing the price of the "coal at the collieries, we beg to say that no alteration "has been made in the price of our coal for that "market for more than 12 months, and, as far as we "are aware, the present system works satisfactorily." This is another: "In reply, we beg to say that the "changes made in June last has not had the effect

* The witness afterwards added the following note:—No signalling charges are made in respect of the Wingerworth Colliery at Clay Cross; but that company do pay such charges for their Avenue Colliery situate between Clay Cross and Chesterfield, and rendering extra signals necessary.

" of advancing the price of coals at the pits, as no " general advance has been made for more than 12 " months past. We consider the restrictions were " necessitated by the circumstances. The traffic now " works better in consequence of the limitation of the " number of traders." I had a similar circular addressed to the coal merchants, and five out of nine have sent replies ; the others have not. "In reply to " your inquiry, we beg to state that we have not made " any advance on the price of our coals since Septem- " ber 1864. There has been an exceptional case or " two, in which one or two of the collieries have " advanced us, but we have not charged it to our " customers." This is another : "In answer to your " inquiry, I beg to inform you that the price for coal " at Nottingham is the same now that it has been for " a period of more than 12 months past." Another writes : "This is to certify that I have not advanced " the price of any of my coal since October 1864, " although two of the collieries advanced the price " to me."

13,683. (*Capt. Galton.*) When was this system commenced ?—About the middle of last year. This is another : "In answer to your inquiry, the price of coals " is the same as it was 12 months ago." This is another : "In reply to your question, I have to state " that (with two exceptions) there has been no altera- " tion in our prices of coal since October 1864. The " two exceptions in question are the Bennerley coals, " the colliery having advanced them 6*d.* per ton, and the " Grassmoor coals, which the Grassmoor Company have " reduced 3*d.* per ton ; our prices have simply been " altered for those two coals only in the same ratio." Referring again to the Wingerworth Company, I have a return before me showing the quantity of coals sent from the various collieries into Nottingham, and the parties are named. I find that there were 67 coal merchants in a place like Nottingham, and of course it is idle to suppose that the traffic could be conducted with anything like satisfaction either to the company, the coal owners, the coal merchants, or the public ; but this return is for the month of December 1864, and during the entire of that month, it appears that the Wingerworth Company sent four waggons to Notting- ham out of a total number of 1,571.

13,684. (*Mr. Horsfall.*) Do you know what is the total getting of the Wingerworth Company during a week ?—I should think, perhaps, 2,000 or 3,000 tons weekly ; it may be 5,000, but I really cannot say. I have also had taken out a return for three months before the alteration took place, and since the altera- tion, and for the same three months at Nottingham I find that in November, December, and January in 1864, 1865, and 1866, the quantity has increased from 21,657 tons in three months, when we were in a state of confusion, to 24,579 tons since the alteration was made, so that the traffic has increased very considerably at Nottingham, and I have not had a single complaint from any of the public, nor from any of the large coal dealers. I find that a great number of the small dealers in three months only received a single waggon, or they were running from one to 10, or 14, or 15. There was a man of the name of Brentnell who com- plained very much ; he said that his trade had been stopped. Out of 24,079 tons he had only in three months about 150 tons, and whereas nine traders had 3,543 trucks during that time Mr. Brentnell had only 25 trucks. It was also stated by Mr. Brentnell that Mr. Revill was stopped in consequence of not conforming to the regulations and not paying our demurrage. I hold in my hand an agreement that was signed by Mr. Revill, and this is signed by all parties using the coal wharves. " In consideration of the Midland Railway Company " affording me siding accommodation at their coal " wharf at Nottingham, for the receiving and unload- " ing the coal which may be conveyed by them, and " consigned to me at such wharf, I hereby promise " and engage with and to the said company, that I " will cause all waggons whatsoever, containing coals " consigned to me, to be unloaded within two clear " days after their being placed upon the said wharf ; " or that in case of neglect I will pay to the " Midland Railway Company, on demand, for the " occupation of the siding, and for the trouble and " inconvenience which may be thereby occasioned, " the sum of 1*s.* for every day or part of a day that " each waggon shall remain unloaded after the expira- " tion of the said period of two clear days." We allotted to this man sufficient room for seven waggons, and I find by the return that he frequently had 15, 20, and even 25 waggons with no place to put them in, and he then refused to pay the time rate, and we did issue the circular stated. The circular was issued on the 7th November, in consequence of his refusing to comply with the agreement he had signed ; he then intimated his intention to comply with it, and on the 15th November, eight days after, the restriction was with- drawn, so that he had very little to complain of.

13,685. What company is Mr. Brentnell connected with ?—He does not represent any company, he was one of those small coal merchants.

13,686. (*Mr. Hamilton.*) You stated in answer to Captain Galton, that if the railway company provided all the waggons it would require an expenditure of something not far short of a million ?—Yes.

13,687. You estimated the number of waggons at 20,000 ?—Yes ; or from that to 22,000.

13,688. Do you estimate the cost of a waggon at 50*l.*?—Yes ; originally they cost more than 50*l.* I may have been a little over the mark in saying a mil- lion, because many of them would be probably cheaper, and we should buy them as low perhaps as 25*l.* or 30*l.*, in consequence of their age, but a new coal waggon now will cost about 80*l.*

13,689. (*Lord Stanley.*) To carry what load ?—It makes very little difference whether it is six tons or eight tons ; we have just contracted for 1,000 mineral waggons, very similar in construction to the coal waggons, and I think the price is 84*l.* per wagon.

13,690. (*Mr. Hamilton.*) If the stock was new, your estimate was within the mark rather than over it ?—Very much within it.

13,691. (*Chairman.*) Do you think that if the coal waggons all belonged to the company there would be much difficulty in satisfying the trade that they were fairly dealt with ?—I think not ; I should mention that many years ago, when I had the management of the York, Newcastle, and Berwick Railway, we adopted that plan and bought the coal owners' waggons ; it worked very satisfactorily, and it has continued to this day. On the North-eastern Railway they do find all the waggons, and on the Great Northern the company find the greater part of the waggons. I think probably they have complained occasionally of the trade perhaps outgrow- ing the supply of waggons ; I think that is very likely.

13,692. (*Mr. Glyn.*) I suppose the circumstance of a railway company owning the waggons would very likely tend to prevent the waggons being defective ?—Yes ; no doubt they would be a better class of waggons.

13,693. (*Sir R. Hill.*) How many waggons does your company own ?—We have none, except for our own purposes.

13,694. All your customers supply their own waggons ?—Yes.

13,695. Do any of the goods waggons belong to in- dependent parties ?—I think not.

13,696. This arrangement is peculiar to the coal waggons ?—To what we term the mineral traffic, it is for coals, and iron ore, and limestone, and that descrip- tion of traffic, that the owners find the waggons.

13,697. (*Mr. Glyn.*) In fact the mineral traffic is conducted on entirely different principles from the goods traffic ?—Yes, entirely. We do not know whether the coals are required or not, they are brought to us, and we carry them to their destination ; a piece of paper is handed to us to this effect, " Receive so many wag- " gons of coal for so and so, Birmingham or Notting- " ham," and we take them there ; we do not know whether they are required. It is a constant occurrence that when the coals reach their destination we find that the person has already his siding or his wharf tolerably

J. Allport, Esq.

1 Mar. 1866.

full, and he cannot receive them, then we put them into sidings to wait until he can receive them.

13,698. Unless you entered into some different system for delivering the coals, would it be possible to make any arrangement to allow them to carry on the traffic regularly ?—Not unless we took it into our own hands.

13,699. Have you contemplated also delivery at the station at which they arrive ?—No ; but I should adopt different regulations if the coal waggons belonged to the company. I should then more rigidly enforce the emptying of the waggons within two days, or not exceeding that. It is very obvious that the Derbyshire coal is not like the north country coal, where you can open a door at the bottom, and the coal all falls out into the cells. The other coal has to be lifted out of the waggons and stacked on the ground. If a coal merchant can sell his coal direct from the truck, and they can come to the station for a ton of coals, he goes to the truck while it is on their own siding, and the result is that he saves labour on that coal. It is a great temptation to a merchant to delay the trucks from that cause, and that is what we have to contend with. If the trucks belonged to the railway company I should certainly enforce the regulation that the trucks should be emptied within two days after they were placed on the sidings.

13,700. You would do that, I suppose, by imposing a heavy fine ?—We should charge them a rent of 1*s.* a day per truck.

13,701. (*Sir R. Hill.*) Do you charge that as the rent now if the trucks remain unemptied an unreasonable time ?—We have such a regulation in force, and when we get such a man to deal with as Mr. Revill, who really set us at defiance, and blocked up our sidings, then we enforce it, not for the sake of revenue, but in order to get rid of the traffic, and to work it satisfactorily.

13,702. (*Mr. Glyn.*) You do it for the purpose of maintaining the regulations ?—Yes.

13,703. (*Mr. Hamilton.*) Would not the saving of plant ultimately be for the benefit of the public ?—No doubt of it.

13,704. That, I think, was the drift of the questions put to you by Captain Galton, that by becoming proprietors of the waggons you would be enabled to save plant, and the public would in the end be really the gainers ?—Probably it would not lead to any perceptible reduction in the price, because the coal owner must charge for the use of the waggons ; he may charge a little more, because every coal owner must now have his own separate establishment, or pay for the repair of his stock, but if the company had them they would be repaired at the central establishment of the company, and they would no doubt be repaired at a cheaper cost at one establishment than at 20, 30, 40, or 50 spread over the country, and to that extent there would be a saving ; we charge so much less, the average is about 9*d.* per ton per trip for the carriage of coal less than other companies charge who find waggons ; we should have to make a charge of that kind if we found the waggons.

13,705. (*Mr. Hamilton.*) From which party would the objection proceed to such a change, the railway company or those who own the waggons ?—I think some railway companies are not prepared for it. My own directors do not by any means all agree with me in the desirability of purchasing these waggons ; I know that other companies entirely differ from me in opinion, that the railway companies should purchase the waggons, and I do not think that the question is ripe for dealing with just now.

13,706. I suppose it comes to this, that the saving would be too small to compensate for the increased responsibility connected with such a regulation ?—It would be more in time and convenience, perhaps, than in money. Certainly there would be a considerable saving of time in getting the waggons cleared out, and getting them away, and in the convenience of not having so large a number filling up the sidings.

13,707. (*Sir R. Hill.*) If I understand you, there would be a saving of about 7,000 waggons ?—I may have said that rather hastily.

13,708. At all events several thousands ?—Yes, no doubt of it ; out of 22,000 waggons we might save a fourth or a third.

13,709. There would be a saving of 5,000 or 6,000 waggons, and a further saving of the standing room for so many waggons ?—Yes.

13,710. Would not those two savings amount to a sum which might be advantageously divided between the company, the coal merchants, and the coal owners ?—It might come to that, but I do not think when you come to take a large quantity, five, or six, or seven millions of tons, it is very appreciable.

13,711. (*Mr. Hamilton.*) Is it not one of your principal duties, as manager of the goods traffic on the line, to take care that there is the greatest amount of work got out of every waggon ?—Yes.

13,712. Is not that one of the secrets of success ?—Yes, and we flatter ourselves on the Midland line that we do get, not only out of the coal waggons, but out of our goods waggons, more than upon many railways in the kingdom. We have a large staff of inspectors, whose duty is chiefly confined to looking after these trucks, and to see that they are not delayed.

13,713. To see that there are no idle waggons ?—Yes.—It is not our interest to have the Wingerworth or any other coal owner's waggons standing idle, we would much rather see them moving.

13,714. Has it ever happened that by changing an inspector and getting a more efficient officer at particular points you have got a greater amount of work out of your waggons ?—I think not. We hope that our servants are looked after pretty well.

13,715. Still one great object of management is to keep the waggons always at work ?—Yes. I have observed that one witness suggests that all the waggon stock should be one common stock.

13,716. (*Chairman.*) Of all the railway companies ?—Yes. Mr. Brown gave that evidence, but I can conceive no system that would lead to greater confusion than that, or greater delays and inconveniences. There are certain districts where the traffic is very large, and the companies would take good care to keep all the waggons they possibly could in their own hands, to the exclusion of other districts. It is a subject that has been mooted as to having a universal waggon stock over and over again, and I have been on certainly four or five committees for the purpose of considering the best system for interchange, and usefully employing the return empty waggons, and the result of our meetings and consideration is embodied in the railway clearing-house regulations. We do, as far as possible, allow return empty waggons to be loaded. Take for instance, on the London and North-western, a waggon is loaded to Derby, if we have a load to send back on to the London and North-western, we are allowed an extra day to keep that waggon, to load it back on to the parent line. All that has been done to the fullest extent that it can go, but a universal stock would, in my opinion, be a universal confusion.

13,717. (*Sir R. Hill.*) Does any considerable proportion of the rolling stock belong to the rolling stock companies or the waggon companies ?—Yes, but they hire them to the various coal owners. They are not worked in common. A coal owner will hire a certain number of waggons for 12 months, and for that time they are to all intents and purposes the coal owners' waggons.

13,718. Is the company remunerated by a mileage charge ?—No, I think they charge so much per annum for the waggons, a charge varying from 9*l.* to 11*l.* and 12*l.* per annum, according to the size and value of the waggon.

13,719. Without regard to the distance run by those waggons ?—Quite so.

13,720. Are locomotive engines supplied in a similar manner ?—I think not.

13,721. Or ordinary passenger carriages ?—I am not aware of any instance of the kind ; it merely applies to coal waggons. It is, perhaps, to relieve the coal owner of a certain amount of expenditure of capital.

13,722. (*Chairman.*) Do you think that improvements have taken place latterly in getting work out of waggons as compared with 10 years ago?—Yes, they get a great deal more.

13,723. Is that owing to the clearing-house regulations that experience has suggested?—No, I think it is owing to the system of being worked better, the waggons being looked after better than they were. No doubt one cause is the large increase of the traffic of the country, and that has necessitated a better system of working, and better looking after.

I observe that Mr. Brown, of Staffordshire, Cannock Chase, complains of a want of through rates with the Midland. I do not know why he complains. It is true that up to a certain period no through rates were established between those collieries of which Mr. Brown is manager and the Midland, but I think it was owing to some agreement that they had with the London and North-western, by which the coals were carried at a very low rate to Birmingham, which agreement has not expired, but certainly the two local rates combined to all stations upon our Midland Railway south of Birmingham, Moseley, King's Norton, Redditch, and so on, as far as Cheltenham, Stonehouse, and even to Bristol, have not prevented the coals being sent to those places. I mean that two local rates added together still left them much lower in point of charge than the charge to collieries on our own line. Through rates were not kept back to discourage the Cannock Chase coal and encourage coal from our own line, but through rates are now arranged with the North-western Company. Then, in answer to a question put by one of the members of the Commission, Mr. Brown stated that he had no through rates to the north-east. If Mr. Brown had applied for them he would have had them, but how coals can be sent from Cannock Chase through Derby and through the Derby coal field to the north-east I cannot conceive, unless the companies carried them entirely free: even then, I suppose the price is so much higher in Staffordshire than in Derbyshire that he could not compete with the coal owners.

I have put down the various points that my attention was called to before with regard to "terminal charges," "uniform rates," "through booking," and "a uniform classification and publication of the rates."

13,724. (*Chairman.*) What is your first heading?—"Terminal charges." Many of the witnesses, I observe, desire that railway companies should be prohibited from making any terminal charge, and in answer to that I have had a statement made out to show the importance of the question. I find that on the Midland Railway, as near as we can get it out, from the early history of the line, no separate accounts were kept of the expenditure upon the main line, and the expenditure upon the stations; but as near as we can get it out, out of a total capital of 20,900,000*l.*, we have spent upon stations nearly four millions and a quarter alone. I have separated, as well as I possibly can, the amount due to passenger stations, and the amount due to goods stations and sidings, and I find, putting five per cent. upon the cost of the latter, and adding to it the cost for the repairs of the stations and the daily expenses of the goods department alone, that during the year ending December last, the expenses upon the Midland railway for the goods traffic alone were 344,000*l.* The whole of that expenditure involves the question of terminals.

13,725. That sum must be paid out of the terminal charges?—Quite so. I mention those figures to show the injustice that would be committed upon railway companies if they were prohibited from making a charge for terminal expenses.

13,726. (*Sir R. Hill.*) Have you ascertained what is the aggregate amount of your terminal expenses; and can you say whether that amount is repaid in terminal charges?—If it is divided it is a very difficult thing; we do not make a separate charge for terminals. The way in which the rates are made up is to make a total gross charge, including the tolls, the terminal charges, and in case of cartage, the collection and delivery. In many cases it will be found that we carry goods at very low rates, below what, in my judgment, we ought to charge even for terminals, without anything for the use of the line, upon many of our goods which are of great weight. Our traffic is heavy, such as pig iron, and heavy raw material. Now, according to the clearing-house classification, a terminal of 9*d.* per ton is allowed upon certain traffic, and 1*s.* 6*d.* upon other kinds, and these allowances are exclusive of cartage; and if you divide the 344,000*l.* upon the total weight of the goods, it will amount certainly to from 2*s.* 3*d.* to 2*s.* 6*d.* a ton at each end of the line, the mere expenses alone, including London. At London we have not had the same experience as other companies; we are only now developing the London goods business; but in London alone, before we have completed our goods station arrangements, I have no doubt we should have spent at least half a million on the goods alone.

13,727. (*Mr. Hamilton.*) You would expect, of course, to get a return upon that capital by means of the terminal charges?—Quite so. I think it is but fair that we should get a profit; and not only have the working expenses returned, but a profit returned upon them. I do not think that the railway companies hitherto have paid such large dividends as to justify no profit being allowed upon the terminal duties they perform.

13,728. (*Capt. Galton.*) Assuming that you are entitled to make some terminal charge, do you see any objection to having a maximum terminal charge fixed?—I do not see any objection to it, if it was fairly adjusted; on the contrary I think it would tend to settle the matter, and to avoid a great many complaints. These gentlemen who come here complaining of these terminal charges are probably quite unconscious of the enormous sums of money that have been spent by railway companies; in our own case it amounts to nearly one-fifth—just about that—of the entire capital.

13,729. I suppose your case is similar to the rest of the railways in the country?—Yes; very similar.

13,730. You have not probably expended much more upon stations than other companies have in proportion to the wants of your line?—No.

13,731. (*Lord Stanley.*) Do you include in the estimate you have just now given the cost of your new approaches into London, which are not yet completed?—No, I purposely kept out London; I took our capital at the end of 1864, when we had only spent not quite 21,000,000*l.*, but we have now spent some 24,000,000*l.* or 25,000,000*l.*

13,732. (*Sir R. Hill.*) I think you said that your expenditure amounted to about 2*s.* 3*d.* per ton, at each end of the line?—It would amount to that; I have not gone into the calculation, it is a very difficult one; but as near as I can estimate it, it would be about that.

13,733. That would be 4*s.* 6*d.* upon every ton of goods conveyed?—I have taken the ordinary goods traffic, bales and cases and boxes and so on; there is no company in the kingdom, at the larger stations, that can do it for anything like 2*s.* 3*d.* a ton.

13,734. The terminal expenses incurred by the company must be to a very great extent irrespective of the distance the goods are carried?—Yes.

13,735. If you take your gross charges for various distances and deduct 4*s.* 6*d.* from the gross in each case, would you not arrive at a conclusion which would show that the mileage rate is pretty much the same, whether for a short or a long distance?—No, as I stated just now, I believe that in many cases if a fair terminal charge was deducted, it would be found that we carry goods for nothing over the railway.

13,736. That is, where the distance is short?—Yes.

13,737. Have you ever examined the gross charges with a view to determine what is properly the mileage rate after deducting the heavy terminal charges?—We never attempt to fix our rates on the principle of a mileage; they are fixed upon the principle of a gross charge, and the rates vary according to circumstances. As I have explained, upon some parts of our line we may be charging a halfpenny per ton per mile, upon

J. Allport, Esq.
1 Mar. 1866.

other parts three farthings per mile, and upon others a penny for the same traffic.

13,738. I understand that by taking the gross charges as they are, and deducting from those gross charges 4*s.* 6*d.* to compensate you for terminal expenses, a certain amount for rates would remain ?—Yes.

13,739. And those rates may be considered as payment for working expenses ?—Yes.

13,740. Would not that result in this, that the mileage rates would be pretty nearly the same for a long distance as for a short distance ?—Certainly not.

13,741. Would they be higher for a long distance ?—In some cases higher, and in some cases very much lower.

13,742. Then they have not regard to distance ?—No ; one of the witnesses from Derby came and complained of the larger charge from Derby to certain places, Mr. Wheeldon, the corn merchant ; I have been at the trouble of getting out some of his charges that he has called upon us to put in operation. I find that we are carrying his malt a distance of 211 miles for 16*s.* 4*d.* and 218 miles for 16*s.* 8*d.*, those are very low charges, and I think it would have been but fair to have given a few of those instances in which we have endeavoured to bring him into competition with maltsters 200 miles away from his place of trade, when complaining of our charges to other districts. If uniform rates were adopted, such a trade as this would be entirely abolished.

13,743. Can you give me some of the gross charges for short distances to compare with these ?—There are loads of them in the evidence. Mr. Wheeldon complains of the charge of 15*s.* 2*d.* per ton from Liverpool to Derby.

13,744. What is the distance ?—92 miles, which is also brought as a charge against the Midland Company. It is not the Midland railway at all, but still it will illustrate the principle. There is a charge of 15*s.* 2*d.* for 92 miles, which is not an excessive charge, then there is a charge of 15*s.* 8*d.* for 204 miles. If Mr. Wheeldon's principle was carried out, no doubt he would prefer seeing 92 miles reduced to those mileage rates, but the companies would naturally and necessarily, if they paid any dividend at all, keeping within their parliamentary tolls, charge higher rates, and then the longer description of traffic would be ruined.

13,745. The company prefers a longer distance with a small mileage rate to a shorter distance with a higher mileage rate, because the transaction is in some respects a wholesale one ?—That is not the principle that is acted upon. A person will come and say, there is a traffic I can do in a certain part of the country if you will give me a rate to enable me to do it ; and as long as it leaves a profit we give him the rate, and that is the principle which I believe guides every manager in the kingdom. The question of mileage never enters into the calculation.

13,746. According to my calculation, after deducting 4*s.* 6*d.* for terminal charges, when you carry goods a distance of 218 miles you get 12*s.* 4*d.*, and when you carry them a distance of 92 miles you get 10*s.* 6*d.* Which of those transactions do you consider the most profitable ?—The 10*s.* 6*d.* one, most undoubtedly.

13,747. (*Mr. Hamilton.*) It is very easy to understand that a trader is interested in getting a very low rate quoted to enable him to compete at different places ?—That is so.

13,748. But is it also to the interest of the railway company to give him excessively low rates ?—As I have before said, so long as there is a profit upon the transaction, I think it is to the interest of the railway company, certainly it has been an immense benefit to the public to have such such an enormous development of trade throughout the country. The unfairness of the great bulk of this evidence is, that they are perfectly satisfied with the low rates for long distances where they have been enabled by the railway companies to get a traffic which they never had before ; and then they complain because for short distances they are not charged lower rates. Certainly an uniform rate would destroy the trade ; take for example the iron trade of South Wales or of Cleveland. The Cleveland district, as every one knows, has been enormously developed in the last 15 years. I remember when I lived in the north that it was a barren waste, and there was not a work of any description there, but now I believe there are upwards of 100 furnaces there, and it is by means of very low rates that the Cleveland iron has been brought as far as Staffordshire ; large quantities are now brought to the Staffordshire iron masters, and if it was not for that low rate, Staffordshire, as an iron district, would be almost ruined. They have exhausted pretty nearly their own ironstone, but the rolling mills, the works, and the population are all on the spot, and by getting iron from distant markets they are enabled to keep their trade together, and a profitable trade too. But if we were compelled to charge the same rate per mile for short distances, say from the Clay Cross iron works, or the Wolverhampton iron works, to Derby, the same as we charge from Cleveland to Staffordshire, it would result in this,—that we should say we will not have the Cleveland trade, we cannot afford to carry it ; we should not pay our expenses if we charged to all the same mileage rate. Take the iron ore trade, there are enormous quantities now being sent from Northampton to Wales, and also very large quantities brought up from North Lancashire and Cumberland, the hematite, to Staffordshire, which is carried at very low rates. If we were compelled to charge from Northamptonshire to Derbyshire the same mileage rate as from the Northampton quarries to Wales, or from Cumberland to Staffordshire, it would result in Wales and Cumberland being abandoned.

13,749. What we want to know is, if the profit when you carry at low rates is very small, what special interest the railway company has in wishing to retain the power of making such a difference in them ?—I apprehend that if a railway company or any man in business can make 5 per cent. profit, he will transact business for the sake of that 5 per cent., but if he could get 10 per cent. he would be too glad to get it, and if he could get 40 per cent., he would be still better pleased ; that is what influences all railway companies.

13,750. I understand you to say that if the rate was an universal one, the railway company would be very much damaged ?—Quite so.

13,751. Then if that is the case, what special interest has a railway company in possessing the privilege of being able to charge these differential rates ?—Simply because it all tends to make up the total dividend that we have to pay to our shareholders. The aggregate expenses of the railway amount in round numbers to 50 per cent. Upon some traffic it is 60 per cent. ; upon some it is 90 per cent., and upon some it is 30 per cent. ; but it all tends to make up the gross sum at the end of each year which is divisible among the proprietors. If we can get 10 per cent. on one kind of traffic, 20 per cent. on another kind of traffic, and 30 per cent. on a third kind of traffic, all three together are perfectly legitimate, and I think the railway manager would be justified in refusing to take a lower rate of profit if he could get the higher.

13,752. Do you think it is for the benefit of the public that railway companies should have the power of charging differential rates ?—I do.

13,753. And an abatement of that power would be injurious not only to trade but to the railway companies themselves ?—Yes.

13,754. (*Sir R. Hill.*) Your statement appears to show that you charge high rates for short distances ; is that because you charge low rates for long distances ?—Of course that is one way of putting it. We charge moderate rates for short distances, and very low rates for long distances, to enable the trader to transact his business.

13,755. (*Chairman.*) Are you of opinion that a great reduction of traffic would take place if you were compelled to make uniform charges all over your line ?—I believe it would be the most fatal thing to the commerce of this country that could ever occur. I observe that from the last published returns of the Board of Trade,

the value of the exports last year amounted to 164,000,000*l.*, whereas 17 or 18 years ago they only amounted to 50,000,000*l.* That enormous increase, in my judgment, is due to the development of trade by means of railways. It has been a great public benefit to the country, and so long as it realizes any profit at all, they should be allowed to charge anything within their parliamentary tolls.

13,756. Do you consider that in any instance you carry traffic which is actually unremunerative?—I do not know of an instance of that.

13,757. Are you ever obliged to refuse traffic which is offered to you?—We do frequently refuse traffic. As bearing upon the question of the uniformity of rates, I would take as an instance the coal trade. Out of 6,000,000 of tons carried by the Midland railway there would be about 1,500,000 going to London. We carry that at a very low rate, not exceeding three-eighths of a penny per ton per mile; but if all our coal traffic is to be carried at three-eighths of a penny per ton per mile, I am quite sure there would be no dividend for the Midland shareholders from that traffic.

13,758. (*Sir R. Hill.*) Would that be the case if it were all carried at the mean of the two rates?—If you advanced the London rates that would shut up the inland coal traffic. It is a balance now between the sea and the railways. A very slight advance, certainly anything like what is indicated by the question, which would be probably from 2*s.* to 3*s.* per ton more, would drive out the inland coals, and would practically shut up the railway coal trade altogether.

13,759. And cause London to be supplied from remote collieries by sea?—Yes.

13,760. Might not London obtain its coal from nearer collieries at a lower rate than it now does?—No, I think not. The nearest collieries supplying the London market are on the Midland railway. The Staffordshire coalfield is a little nearer, but the quality of the coal is not suitable for the London market, and I know there is no colliery in England which can supply coals to London by railway better than our Midland collieries.

13,761. (*Chairman.*) Will you state your opinion upon the subject of through booking?—The companies have, as far as is reasonable and practicable, adopted through booking both in the case of passengers and goods. It would be impossible to make it universal without such an amount of labour and difficulty that no check could possibly be had. Take the case of passengers: there are probably upon the 13,000 or 14,000 miles of railway in England not less than 3,000 or 3,500 stations. Each station must have at least seven descriptions of tickets. If you multiply 3,000 even by seven there are 21,000, and then if you multiply that again from station to station it would become such an unwieldy thing that no system of accounts or book-keeping could possibly check it. And all for what? I believe it is universal throughout the whole of the railway system, that wherever we find there is a passenger traffic sufficient to justify through booking we immediately put it into operation, but on our own system, as I have already explained, we do not book through from every station to every station. We are obliged to make breaks. Take Birmingham, for instance; we book from small stations north of Birmingham to Birmingham for small stations south of Birmingham, but from large stations, such as Sheffield, Nottingham, or Derby to small stations south of Birmingham, we do book through, but from small stations we do not.

13,762. (*Mr. Horsfall.*) But from every station, however small, you book through to London?—I think we do with very few exceptions; I am not aware that there is any exception on the Midland Railway.

13,763. (*Mr. Glyn.*) You book through to every large place?—Yes; for instance, take a place like Chesterfield, I think we book through from Chesterfield to almost every large town in the kingdom.

13,764. (*Chairman.*) Have you through-booking arrangements with the south-western parts of England?—We have only adopted them very recently. We could not adopt them before in consequence of the break through London, and even now very few people avail themselves of it. People who come to London prefer remaining in London a night or a day or two.

13,765. You book through to a certain extent with Ireland, do you not?—We do. We book from London and all our large stations to Belfast, and one or two other stations in Ireland. As regards goods, we have a more general and perfect system of through booking than is the case with passengers, because it is a difficult thing to re-invoice goods at junctions, and therefore, as far as we possibly can, we have through rates. It is the same with coals.

13,766. What happens when goods are sent to a station off your own line to which you have not made through rates; how are goods forwarded when they get to the end of your line?—I will assume a case. If we were to send a waggon of goods from a small station to go on to the North-western we should invoice it to Rugby, and there the invoice is handed over to the North-western for them to take the particulars and re-invoice it, charging what we term a "paid on," that is, the amount paid to the Midland Company. Then they of course add to that their local charge, and the total charge is paid by the consignee, and the consignee only knows of one transaction. The object of booking through is perhaps more for the purpose of saving delay than any thing else. A passenger can very easily get out of a train, re-book, and go on by a succeeding train, but you cannot do that with goods. Generally speaking, there is a delay of at least 24 hours where goods are re-invoiced at junctions.

13,767. (*Mr. Glyn.*) In that case how would the liability with the next company be dealt with?—The liability to the public would be with the first company, whoever undertook to carry the goods would have to sustain the liability over the whole distance.

13,768. In point of fact the liability would attach to the company first dealing with the goods?—Yes.

13,769. (*Sir R. Hill.*) When a passenger books through to some very distant town, the rate per mile that he pays is less than if he paid his fares to the different places in succession, is it not?—Yes, that is so. Take, for instance, from London to Edinburgh, or London to Aberdeen; if a passenger were to book from London to York, and re-book from York to Newcastle, and from Newcastle to Edinburgh, he would pay more money than by booking through.

13,770. Then the average fare which he pays when he travels the whole distance is less than the ordinary fares?—In no case does it amount to more than the local fares, and in the great majority of cases the through fare consists of the local fares added together; but in the instances I have given from London to Edinburgh, and from London to Aberdeen, there are no doubt very powerful steamers plying between those places, and the fares of those steamers are very low, and the consequence is the companies are obliged to charge lower fares than they otherwise would.

13,771. Can you say whether the railway companies in the returns they make to the Board of Trade of their average fares take these low through fares into account?—Yes, I think we do; but that is more a question for the accountant to answer than for me. I believe we do. I can ascertain that and I will add it to my evidence.*

13,772. (*Mr. Hamilton.*) Is it the fact that on the main lines on which through booking takes place the through fare is the sum total of the local fares?—I should say in 19 cases out of 20 that it is.

13,773. (*Earl of Belmore.*) That is not the case in through booking from London to Ireland?—No, there is a very great difference there. There are a few exceptional cases, of which from London to Ireland is one, and from London to Scotland another.

* The following was afterwards added by the witness:—The average fares are calculated as follows: The total is obtained by adding together the ordinary fares charged for the single journey from either terminus of the line to every station on the line, including branches, and that is divided by the total obtained by adding together the distance in miles of such terminus from each station.

13,774. I do not mean places on the coast of Ireland, but in the interior?—At the request of the Irish companies, most of the companies in England have reduced their fares in order to encourage passenger traffic to Ireland. Some years ago we adopted a low scale of passenger fares from almost all the large towns in England to Dublin, Belfast, and other large towns in Ireland, but that is quite an exceptional case.

13,775. (*Mr. Hamilton.*) Take the case from London to Derby; would the through rate to Derby be made up of the local fares?—That is a local fare.

13,776. You mean that it is all on one line?—Yes; if the passenger had to book from London to Bedford, from Bedford to Leicester, and from Leicester to Derby, the three fares together would come to within a penny or so of the through fare.

13,777. Then you do not give the public more than a small advantage in through booking?—We give the public a considerable advantage in the rates we charge. For instance, by our Act of Parliament we can charge 3*d.* per mile for first-class passengers. With the exception of one portion of our line, our highest charge is 2*d.* per mile. We have abolished express fares for a long time. We have gradually been reducing our fares to that standard, 2*d.*, 1½*d.*, and 1*d.*, and we have abolished what is termed third class. On most lines there are first, second, third, and Government or parliamentary fares, 2*d.*, 1½*d.*, 1¼*d.*, and 1*d.* We have abolished the third class altogether on the Midland. We have taken first one district and then another to reduce the fares to, and now I believe there is but one part of the entire Midland system where the high fares prevail, and those will be reduced on the 1st of May.

13,778. (*Capt. Galton.*) What system is that on?—The Bristol and Birmingham. Last year we reduced the whole of the fares on the southern portion of our line as between Nottingham, Derby, Leicester, and London, and on the face of the account it will be about 26,000*l.* a year. Consequently it would have been too serious a loss to have done it on the whole system at one time.

13,779. (*Chairman.*) Do you expect that it will be ultimately be for the benefit of your company?—I believe it will; already the loss is *nil.*

13,780. Should you be disposed to recommend carrying that experiment any further?—We have carried it very much further on certain portions of our line. Where there is a large population, such as the manufacturing districts, I think low fares will pay better than high ones. For instance, between Nottingham and Derby we have a very large traffic, and between Sheffield and Rotherham, and Leeds and Bradford, and many other places on the Midland Railway we do not charge half our parliamentary scale, but I do not think it would increase travelling to any very great extent if we reduced the fares. Generally, particularly in agricultural districts, or where there is very little travelling, people do not travel unless they have either business or pleasure.

13,781. (*Earl of Belmore.*) It would not answer to reduce the fares all over the system of railways uniformly, without any consideration as to whether part of the district traversed was agricultural and part manufacturing, or whether it was wholly manufacturing or wholly agricultural?—Certainly not. The companies generally have exercised their discretion as to reducing the fares in certain parts. They have done so where it has been proved to them to be for the public benefit, and of course also where they expect an increased traffic to a very large extent.

13,782. (*Sir R. Hill.*) In the cases you have named of charging very low fares between neighbouring towns, do you not reverse the principle which you described a short time ago, of charging a low rate of mileage for long distances, and a high rate of mileage for short distances?—Passengers load and unload themselves.

13,783. But you do reverse the principle?—No doubt we do.

13,784. Although passengers load and unload themselves, must not the terminal expenses be increased in respect of passengers?—Not in the terminals I have given; I have confined my remarks to goods terminals alone. I have not added the cost of the passenger stations or the cost of working the passenger stations. The figures I have given apply exclusively to goods.

13,785. But with the view of ascertaining the fairness of passenger charges, must we not consider that certain terminal expenses are incurred as respects passengers?—Certainly.

13,786. Booking expenses, and so forth?—Yes.

13,787. If, therefore, you were to deduct the terminal expenses in respect of passengers from the total fares of the passengers, the mileage rate for these short distances would be something very small indeed?—The terminals on passengers must be exceedingly small. Indeed, I have no doubt that has influenced companies in the earlier history of railways not to charge terminals on passengers. It was never contemplated in the original acts of Parliament that railway companies should find these large stations without charge; they were merely to provide the railways, and other people were to provide the stations. It is owing to the very small charge which would be necessary to cover the expenses that that has never been done.

13,788. Are you aware that there is upon the Brighton line an instance where they issue a ticket for one penny by parliamentary trains?—Yes, I dare say there is. I have no doubt that we have places upon the Midland line where we charge a penny.

13,789. One would think that the whole of the penny would be absorbed in terminal expenses?—Not when you come to spread it over a large number of passengers, amounting as they do to millions. It is a small per-centage, and the expenses for passenger stations are very much smaller than they are for goods.

13,790. (*Mr. Gower.*) Is the increase in your traffic consequent on the reduction you have made in the fares owing in your opinion to traffic diverted from other lines or traffic newly created?—I think it is traffic newly created. Take again the Midland coal field; 25 years ago there was scarcely a colliery upon the entire line between Derby and Leeds. Now it is one series of colliery works from one end to the other. I hold a return in my hand showing the increase of mineral traffic upon the Midland Railway. From 1850 to 1865 we have increased our mileage from 506 miles to 748 miles. We have increased the tons of goods from 1,198,000 to 3,874,000; we have increased the tons of minerals from 1,280,000 to 5,294,000; and our total weight of goods and minerals from 2,479,000 to 9,169,000 tons. I believe that is entirely due to increased facilities, and not to having taken traffic from other railways. It is probable, and no doubt is the fact, that the railways have taken a great deal of traffic from the canals, but all the canals in our part of the country could not accommodate anything like the traffic I have stated from these tables. It is a pure development of the resources of the district.

13,791. (*Mr. Glyn.*) Is the same increase going on over the whole country, to your knowledge?—I believe over the entire country; certainly it is the case on all the larger railways. The North-western, the Lancashire and Yorkshire, the Great Northern, the North-eastern, the North Staffordshire, and the Great Western, in my opinion, all show a corresponding increase.

13,792. Has agricultural traffic increased in a larger ratio now from what it was before railways were introduced?—No, there seems to be almost a stagnation in the agricultural parts of the country. Some portions of our line pass through agricultural districts which are remarkable for their small development of traffic. We have tried everything, including low rates and extra facilities, but there is only a certain amount of produce to come out of the country, and whether it is carried at moderate rates or no rates at all we cannot get more. And it is the same with passenger traffic. The agricultural people are essentially a non-travelling people.

13,793. (*Lord Stanley.*) You get all the traffic that is to be got at the present rates?—Yes. I do not know that there is any instance where high rates have

prevented agricultural produce from coming out of any district.

13,794. (*Sir R. Hill.*) Taking railways as a whole, the rate of increase in goods and mineral traffic far exceeds the rate of increase in passenger traffic, does it not?—It does.

13,795. Can you state what is the comparative rate of increase?—I should state with regard to passengers, that although the mileage has increased from 506 miles to 748 miles, and the traffic in goods and minerals has increased so largely, that the total receipts from passengers have only increased from 607,000*l.* to 902,000*l.*, or about 49 per cent., against nearly 300 per cent. in minerals, and nearly 200 per cent. in goods.

13,796. Does that pretty accurately represent the increase all over the kingdom?—It does.

13,797. (*Chairman.*) Would the mineral traffic be as largely increased upon lines generally as upon your line?—Not unless there is a coal field. Our great object has been to send our coals the longest possible distances that we can. Gentlemen travelling in the south of England may see Midland coal waggons as far as Brighton, Southampton, Dorchester, and the extreme south-east of England. Our object has been to get our coal into every possible market that we can, and we invariably take a mileage rate with the companies who are willing to join us in these low rates.

13,798. (*Mr. Hamilton.*) As a rule, do you carry manure and other things which are necessary to carry on agriculture with, at a very low rate?—Yes, we do.

13,799. You feel that they have a claim upon you?—I do not know that it is from any feeling of sympathy for the agriculturalists, but it is purely a question of business. Can we get anything out of it? We know that manure can only travel a certain distance; it cannot go many miles, and we charge low rates to enable the farmers to get it. I am afraid I must say that it is not the result of any particular love for the farmers, or for any particular district, that we do it.

13,800. You simply feel that if you do not charge a low rate you would get nothing at all?—Quite so.

13,801. There is no favour?—No; at any rate I would say no partiality.

13,802. (*Sir R. Hill.*) Do you charge as low for manure as for minerals?—I have not our rates with me, but I should think we charge lower for manure than we do for minerals. We do not take manure for anything like the same distance that we take minerals. We should not take manure, for instance, from London into Derbyshire, so that I can hardly draw a comparison. Manure will go, say 50 miles; if you had a manure rate for 50 miles and a coal rate for 50 miles we should charge more for coals.

13,803. (*Mr. Gower.*) With regard to the interchange of traffic, I understood you to state that you invariably fixed the time of the departure of your trains solely with reference to the public convenience, and without reference to the interests of your own company?—Of course the departure of our trains is fixed with a double reference to the interests of the company and the interests of the public. The honourable member seemed to suppose that our trains were fixed with the view of preventing passengers taking certain lines, and what I stated was that that was never done.

13,804. I will call your attention to a case which I am familiar with from living in the neighbourhood, and that is the difficulty of getting from Grantham to Lincoln, have you ever considered that?—That is not on the Midland Railway.

13,805. But the Midland Railway goes from Newark to Lincoln?—It does; but from Grantham to Lincoln is on the Great Northern.

13,806. I am referring to the very inconvenient hours at which the different trains leave Newark to go to Lincoln?—That is a very good illustration of what I remarked. Our trains to Lincoln are timed with reference to the arrival at Derby from various quarters. Having reference to forward trains from Lincoln to Hull and Grimsby, they must run at a certain time. The Great Northern trains are fixed with reference to their own main line. There are very few people from the Great Northern line going forward on the Midland. If we attempted to arrange our trains, which we should be very willing to do if we could, because it is clearly our interest to take all the passengers from Newark to Lincoln which the Great Northern could bring us, we should do so, but we cannot, unless we put on such an additional number of trains that it would never pay.

13,807. What would be the inconvenience of delaying the departure of your train half an hour from Newark to Lincoln, as compared with the advantages which the public would derive from such a change?—Picture to yourself a train stopping at a small place like Newark, with perhaps from 100 to 150 passengers, and delayed there half an hour, waiting for one or two passengers coming from the Great Northern to Newark. I should be very sorry to be at that station amongst those passengers.

13,808. Would not the result of a delay of half-an-hour be, that the whole traffic from London to Lincoln would go by the Great Northern instead of the Midland?—The direct route from London to Lincoln is by the Great Northern. You would not come to Grantham from London to Lincoln, but by way of the loop line. From Peterborough the line is as direct as it can be. No passenger would come from Newark to go to Lincoln.

13,809. All passengers travelling from London to Lincoln go by the Midland, and not by the Great Northern, do they not?—I should say it is exactly the reverse. I do not suppose we get 10 passengers a week from London to Lincoln.

13,810. Do not all passengers coming from London by the Great Northern have to remain two hours at Newark in order to get on to Lincoln?—That is not the route to Lincoln. They do not come to Newark at all. The route from London to Lincoln is by way of Peterborough. The line is as direct as it can be from London to Lincoln.

13,811. (*Chairman.*) What is your next head?—The uniform classification of goods. No doubt the classification under our Acts of Parliament of all the companies differ very materially from the clearing-house classification. It has been suggested that that classification should be uniform. To a certain extent that might be adopted. But, again, you must allow companies a certain amount of discretion, because what is a very large source of traffic in one district is a very small one in another district. I cannot adduce a better illustration of that than the article of raw silk. It would be manifestly very unfair to put raw silk generally in the third class, or even manufactured silk, because it is a very expensive article, and to the greater part of the kingdom it goes in small quantities; for instance, to the manufacturing district of Nottingham, Macclesfield, and Coventry. The same remark would apply to pig iron, and iron generally, and a variety of other things. To show that uniformity has been attained to a great extent this classification prevails, with the exceptions I have pointed out, throughout the kingdom.

13,812. The general rule is uniformity of classification among all companies, with particular exceptions?—Yes, it is.

13,813. Have you any observations to offer upon the question of the publication of rates?—It has been insisted upon by several parties that the rates should be published, but that would be an utter impossibility. Whenever there is any alteration of a rate the trade is invariably informed of it, but at our large stations the rates amount to many thousands, and they necessarily vary from time to time as the trade requires alterations, and a correct list to-day would be a very incorrect list next week. Therefore a compulsory publication of rates would lead to great delay in getting any alteration of rates at times when the public would require it. For instance, it frequently happens that people come to us and say, there is a large contract, such as a contract for rails, or any other material, there are 5,000 or 10,000 tons of rails, and if we reduced our rate it is very likely

Allport, Esq.
Mar. 1866.

we should get it, but by the time the rate is published the contract would be let and the traffic lost.

13,814. (*Capt. Galton.*) Do you see any objection to companies keeping a rate book in some place accessible to the public, so that they might be enabled to see what the rates are between two places?—I am not aware that anybody has ever been refused. We furnish stations with a list of rates, and certainly I never have given instructions not to let the public know them. I believe our rates are as well known to the public as to ourselves.

13,815. (*Lord Stanley.*) Still that is more a matter of favour to the public than of right?—I do not think there would be the slightest objection to all the world knowing what our rates are; it is merely the convenience of the thing.

13,816. Is it a fact that the rates of one week are altered in the following week?—Frequently; I suppose there is not a day passes in which rates are not altered throughout the kingdom.

13,817. Not raised?—I dare say they are raised frequently, but they are very much more frequently lowered than raised.

13,818. (*Mr Glyn.*) What previous notice do you give?—Generally a month. We never advance or lower our rates, except at the first of the month, unless it is to meet the special cases of contracts which I have indicated, which must be done on the spur of the moment; but otherwise they are always altered on the first of the month.

13,819. (*Mr Horsfall.*) Consequently any change of rates could only take place once a month?—We alter the rates so as to come into operation on the first of the month; but there are many special cases, such as I have indicated, constantly arising of their being altered from day to day.

13,820. On those days it is not necessary to give a month's notice?—No, we do not in that case give a month's notice.

13,821. (*Chairman.*) Are you acquainted with the system adopted on foreign railways?—I know the system to a certain extent.

13,822. Are you aware with regard to this point that all the rates and charges in France are published every three months?—I am aware of that.

13,823. Can you explain why, if it has been found practically advantageous in France, the contrary should be the case in England?—This I know, that the practice in France has tended most materially to interfere with the development of the trade between the two countries. We are now booking through to many places on the continent; but we have the greatest possible difficulty in getting through rates with them. We frequently find that goods take a very circuitous and indirect route; but the French railways in consequence of that law cannot reduce their rates, and we have had great difficulty in getting through arrangements with foreign railways entirely owing to that system.

13,824. Is the system of uniform charges very much more adopted in France than in England?—I cannot answer that question.

13,825. (*Mr. Hamilton.*) You say that the difficulties of through booking have been very much increased through the system of the publication of uniform rates which prevails in France; what is the reason of that?—There are steamers running between Hull and Grimsby to Havre, and the rates by that route per mile are perhaps the same as by way of Boulogne or Calais; but in consequence of that law prevailing in France, the Direct Northern of France Railway Company cannot alter their rates to meet the competition by way of Havre, and we consequently cannot make those satisfactory through arrangements to Paris with the trade at Leeds or Bradford that we otherwise could do. We should prefer sending goods by the direct route, but the railway companies say they cannot alter their rates. To that extent it interferes very materially with the through booking arrangements which the English companies wish to make with the foreign.

13,826. (*Chairman.*) If you are bound to publish the rates you cannot make any reduction so as to obtain specific traffic?—That is so.

13,827. (*Mr. Hamilton.*) No doubt it prevents a competing route, and prevents your forming arrangements for through traffic at such rates as will enable you to compete with other routes; but still you can form arrangements for through traffic at certain rates?—A manufacturer at Leeds, perhaps, cannot sell his goods in France unless he can get them carried at a certain rate. We are as anxious to get them into the French market as we are into our English markets if we can carry his goods at a low rate with profit; but in numberless cases a trade has been abandoned because we cannot make these through arrangements.

13,828. Do you mean to say that your inability to depart from this uniform scale stops a particular trade?—Yes, it does.

13,829. I understood you to say that it prevented your making through booking arrangements?—By stopping the trade. Of course at a high rate we can make through arrangements.

13,830. It does not, then, prevent your having the power of making through booking arrangements?—No; but it is of no use our making through booking arrangements at a high rate.

13,831. (*Capt. Galton.*) Does not the law allow them to carry at a lower rate than the published rates?—I think not.

13,832. (*Mr. Horsfall.*) How often do they renew the publication of their rates?—I am not sufficiently acquainted with that to be enabled to answer the question. I believe it is every three months.

13,833. (*Sir R. Hill.*) There is no necessary connexion between uniformity of rates and non-publication of rates?—No, there is no connexion necessarily.

13,834. (*Chairman.*) Are there any other points on which you wish to offer any information?—I wish to refer to one portion of Mr. Galt's evidence. At question 7382 he is asked, "What remarks have you to "make in regard to the coal traffic"? to which he replies, "Coal can be conveyed from the northern "counties up to London at the rate of from 1*s.* 6*d.* to "2*s.* 6*d.* per ton." I do not know how Mr. Galt gets his figures, but it is utterly impossible that coal can be carried at such a rate. Then he goes on, "The "charge here in London is exceedingly high, about "28*s.* or 30*s.* per ton being the ordinary price, at this "time of year, for the best coal, whilst the cost at the "pit's mouth, in South Yorkshire, is not more than "6*s.* per ton, so that in fact it can be brought up to "London for about 9*s.* per ton, and pay a good profit "for carriage to the companies. It would be exceedingly desirable that the cost should be reduced "in London to the public at large, and especially to "the poor, who suffer great privations during the "winter, owing to its extreme dearness,"—leading the Commission there to infer that the difference between 7*s.* or 8*s.* at the pit's mouth, and 28*s.* or 30*s.* in London, is the railway charge. It is clear Mr. Galt can know nothing at all about the coal traffic, because taking the great bulk of railway coal which is brought to London, I should think it certainly would not average more than 5*s.* 6*d.* per ton.

13,835. Including terminals?—Including terminals. Our rate from Clay Cross, which is about the centre of the district, is 6*s.* 4*d.* per ton, which includes the 1*s.* 1*d.* city dues, which taken off reduces it to 5*s.* 5*d.* per ton. From nearer collieries the charge is still less. The charge from York to London is about 8*s.* per ton. I know it is brought from the collieries to York at three-eighths of a penny per ton per mile, which would be about 1*s.* 6*d.* or 1*s.* 8*d.* per ton; so that taking the extreme north of England, for instance, Durham, which I contend cannot send coals to any large extent by railway, the charge is very much below what Mr. Galt would imply here. After many years' experience, we find that the average cost per train mile is 2*s.* 4*d.*; that is without the waggons. Of course the waggons have to be charged for by the coal owners.

13,836. (*Capt. Galton.*) 2*s.* 4*d.* there and back?—No; 2*s.* 4*d.* per train mile, for the mere run of the engine.

13,837. (*Sir R. Hill.*) You are speaking of coal trains?—Yes.

13,838. (*Capt. Galton.*) 2*s.* 4*d.* per train mile is for what the company themselves supply for making up the train?—Yes, that is the mere cost; and it is double that because nearly the whole of the coal waggons come back empty. If you double that it makes nearly 5*s.* per train mile as the absolute cost; that is without reckoning the interest upon the engine.

13,839. That is merely reckoning the bare cost of the engine, men's wages, the coke, and the repairs of the engine?—Yes, that is the mere bare cost; but how it can be brought up to the price named by Mr. Galt I cannot conceive. We find it to be very bare indeed at three-eighths of a penny per ton per mile. It does leave a profit certainly, but it is the lowest profit we have upon any traffic we have upon the Midland Railway. I do not think it is possible, with our present appliances, that coal can be brought to London cheaper than it is at the present time, and leave any profit to the Company.

13,840. (*Capt. Galton.*) You could not bring it in larger trains than you now do?—If you increase the size of the trains you very much increase the difficulty, because you must have everything so much stronger. We find that a train of about 35 or 40 waggons is the maximum load that ought to be carried, and if you get beyond that the coupling chains, engines, waggons, and all the materials must be made stronger, and there is an amount of wear and tear which more than counterbalances the benefit of the extra load.

13,841. (*Sir R. Hill.*) What would be the weight of coal conveyed by such a train?—They are six-ton waggons, and if you have 40 waggons of course they carry 240 tons, and if they are eight-ton waggons they will carry 320 tons.

13,842. Was not evidence given before a Parliamentary Committee a year or two ago to the effect that on the Great Eastern Railway they could carry coal at a farthing per ton per mile?—Yes, there was. I know the traffic on the Great Eastern pretty well, because they derive nearly the whole of their coal from us. We have as good a line for gradients as the Great Eastern. They assumed 400 tons of coal for each load; but as I said before, you cannot practically carry 400 tons in one load, because it becomes so unwieldy and difficult to deal with, and the coupling chains are so constantly breaking that it is far more convenient to take 500 tons in two trains of 250 tons each than to take one train with 400 tons.

13,843. If a train of 400 tons were brought at one time the cost of locomotion would increase and be far greater for 400 tons than for 100 tons?—It would.

13,844. Do not many of those calculations of Mr. Galt proceed on the assumption that the cost of working a train is a fixed amount, whether the train is a long or a short train?—That is a perfect fallacy.

13,845. Can you give us any idea how the cost increases with the length, that is to say, how much it would be with a single carriage, and how much it would be with an engine and the maximum number of carriages?—I have not the figures with me, and therefore I cannot arrive at a very close calculation as to the cost, but on the old Midland Railway, which is as good a line as was proposed to be made by the Great Eastern, and called the Northern Coal Line, we have as good a gradient as that, and we can carry 400 tons with perfect ease; so can the North-western. The North-western is a line with remarkably good gradients, like the Midland, but in practice we find it better and cheaper to have small manageable trains than these long and unwieldy ones.

13,846. You are not prepared to state the cost of a train of the minimum length, and a train of maximum length?—I am not; but, as I said before, the average cost of the Midland trains, taking the long trains and the short trains, and the light and heavy trains, will be about 2*s.* 4*d.* per train mile.

13,847. But you say that the cost of a longer train would be considerably greater?—No doubt.

13,848. Does it not follow that the cost of a shorter train would be considerably less?—Down to a certain point.

13,849. You cannot state what that minimum cost is?—I should think you could not run a train at all under something like 2*s.* per mile; but it is a very difficult thing to estimate; for instance, with regard to our permanent way, we know that our permanent way cost us about 4*d.* per train mile, but what amount of injury it sustains by a train with a single carriage or by a train of 40 carriages of course it is impossible to arrive at. The consumption of coke, oil, and so on, and engine-man's wages, fireman's wages, and guard, is precisely the same, whether a train consists of one carriage or 50.

13,850. Is the consumption of coal the same with a train of one carriage as with a train of 50?—Pretty nearly, there is very little difference, perhaps not more than 3 or 4 lbs. per mile.

13,851. Is the wear of the engine the same?—Very nearly.

13,852. Do you not work your steam expansively?—Yes, we do; but that is a question of, as I said before, a very few pounds per mile. With regard to taking of a train of one carriage, it is a very rare thing to see a train of one carriage. Take an ordinary light train of five or six carriages, there is very little difference between the cost of that train and one consisting of 10 or 12 carriages. I am speaking of passenger trains, but it is the same with goods trains; we do not, if we can help it, run goods trains of less than 20 trucks. There is very little difference in the consumption of fuel between a train of 20 trucks and a train of 30 trucks.

13,853. (*Chairman.*) Is Mr. Galt correct in saying that 6*s.* is about the cost of coal at the pit's mouth?—No; at the present time we are paying 7*s.* 3*d.* per ton for our locomotive coal; we send the waggons, they merely have to put the coal in, we bring it away from the pits. I know in Staffordshire coal at the present moment is as high as 11*s.* or 12*s.* per ton at the pit's mouth, and some coal in Derbyshire is the same. What is called the Kilburn coal is charged 12*s.* per ton at the pit's mouth.

13,854. (*Lord Stanley.*) Coal has rather risen in price, has it not?—It has risen very much within the last three or four years, and, I think, will continue to rise; there seems to be great uneasiness among the working classes in the mining districts, and wages will naturally go up in consequence.

13,855. (*Chairman.*) Is not the average charge by the Midland for coals from Derbyshire to London about 4*s.* 6*d.* per ton?—I should think it is about 5*s.*

13,856. Whatever is charged beyond that to the consumer in London is either the cost of delivery or the coal merchant's profit in London in addition to the original cost price?—I think at the present time the price of coal at the pit's mouth would be probably 8*s.* per ton, the coal owners invariably put 1*s.* on for waggons, that makes 9*s.*; then take our charge of 5*s.* for the carriage, that makes 14*s.*; then there is 1*s.* 1*d.* City dues, which is 15*s.* 1*d.* With regard to delivery in London, a scale is adopted; taking long distances, it seems they charge 3*s.* per ton for delivery, that makes 18*s.* 1*d.* per ton. Then there is the merchant's profit. I am speaking now of inland coal. Mr. Galt is entirely wrong in stating that the price of coal in London is from 28*s.* to 30*s.* He is taking the Durham coal, which is a more expensive and a better coal, and realizes a much higher price in London than other descriptions of coal. If you were to look in the "Times" for every day for some time past you will find that the price of Derbyshire coal is very much below that. With the exception perhaps of that very severe winter which we had some few years ago, I never remember Derbyshire coal at anything like 25*s.* per ton.

13,857. In November, when he gave his evidence, the price would be considerably above the average of the whole year?—It would.

J. Allport, Esq.
1 Mar. 1866.

13,858. (*Sir R. Hill.*) Do you object to carry packed parcels?—We have not objected.

13,859. By what trains do you generally take them?—Generally speaking, goods trains; we take them by the trains that people bring them to.

13,860. What rates do you charge?—We have a special scale for packed parcels.

13,861. Do you charge the highest rate which you are entitled to charge?—No, but we have the power of unpacking the parcels. There are but few companies in the kingdom which have that power, and we have never exercised it.

13,862. Have you special authority to do that under your Act of Parliament?—Yes.

13,863. You do not avail yourselves of that power?—No, we never have.

13,864. You take the package as a single package?—Yes.

13,865. In what class of goods do you place it?—We put it in the fifth class.

13,866. What rate would that be per ton?—It depends on where it is going.

13,867. What rate per ton per mile would it be?—We have no rate per ton per mile. We charge a certain rate, for instance from London to Derby, or London to Leeds, or London to Bradford, without reference to the mileage.

13,868. Can you give any instance of a rate; can you say, for instance, what the rate would be from London to Derby?—I will fill that up in my evidence. The rate is 3*s.* 3*d.* per cwt.

13,869. If the aggregate package weighs less than a ton, do you charge the fraction?—We charge the exact weight of it.

13,870. That is to say, if it weighs 1 cwt., would you charge the twentieth part?—Yes.

13,871. Do you charge the same if these parcels go by passenger trains?—No, we do not, we charge higher rates if they go by passenger trains, we then charge the ordinary parcel rates. The rates are not charged upon any mileage principle. We charge 6*d.* for a small parcel up to a certain distance,—I do not remember the scale exactly, 9*d.*—and 1*s.*; not as we do goods.

13,872. Do you charge the same for packed parcels as for a parcel which consists of one kind of goods only?—By passenger trains we do, but our goods trains now run so quickly through the country that people avail themselves of the goods rates to send these packed parcels by.

13,873. When you revise your evidence will you be kind enough to state what is the charge per cwt. or per ton for packed parcels conveyed by passenger trains, say between London and Derby?—I will.*

13,874. (*Capt. Galton.*) Have you read Mr. Galt's evidence on parcel traffic?—I have.

13,875. Do you differ from that?—I did not go into Mr. Galt's evidence generally. I allude to that one particular part.

13,876. Are you of opinion that the traffic on railways could be developed to a greater extent than it now is by mutual arrangements between the companies?—There are mutual arrangements now. I do not know that you cannot send a parcel from almost every part of the country to every other part at through rates.

13,877. At sufficiently low rates?—At sufficiently low rates. I once made the experiment some few years ago, and reduced the charge for parcels to an uniform scale irrespective of distance, and carried it on for two years, if not longer, but it was not successful by any means; it did not increase the number of parcels at all.

13,878. You reduced the rates?—I reduced the rates.

13,879. (*Earl of Belmore.*) I suppose in fact the public do not send parcels unless they really want the things to go. Merely reducing the rates would not induce them to send parcels?—No.

13,880. A reduction of rates does not induce shopkeepers to send small parcels of goods from one place to another?—I think not.

The witness withdrew.

* The charge is 9*s.* 4*d.* per cwt.

Note subsequently added by the Witness to his Evidence.

Referring to the Wingerworth Company's complaint of delays in forwarding their waggons between Clay Cross and Derby, it did not occur to me when the paper was so suddenly placed in my hands by an honourable member of the Commission that, not having a night staff at Clay Cross, we do not take the numbers of waggons leaving the station in the night; and as some of the waggons referred to in the complaint left by night trains, we have, unfortunately, no record of them, and I am consequently unable to state what time they did leave; but in my investigation of the matter the following facts have been brought under my notice.

1. The complaint is that during certain days in December last 16 waggons were from two to six days in travelling from Clay Cross to Derby.

2. The Wingerworth Coal Company are allowed siding room at the Derby coal wharf for 10 waggons.

3. During the day and night there are six coal trains from Clay Cross to Derby, and on several of the days mentioned in the complaint the Wingerworth Company had a larger number of loaded waggons in the wharf than they had siding room allotted them; and further, that whilst the number of loaded waggons in the siding was, as just stated, occasionally in excess of what it should have been, the number of waggons emptied and sent out of the siding was never higher than eight, in two instances one, and several instances not more than two or three per day.

4. It frequently happens that in consequence of the overcrowding by the colliery people of the station sidings allotted to them waggons have to be placed in other sidings some distance from the station, and it will be evident that in dealing with traffic thus thrown out of ordinary course there must be occasional delays to certain waggons, and more particularly so in the months of November and December, about which time we are invariably subjected to great pressure of traffic, and when, to save time and unnecessary shunting, each day's waggons are worked as far as possible direct into the wharf, irrespective of the excess waggons of previous days, which often for several days in succession increase rather than diminish in the sidings above referred to. I would observe further that the great and irregular pressure of traffic referred to, whilst it involves nothing of any consequence to the colliery owners beyond occasional delays to individual waggons, is a matter of serious consequence to the railway company, necessitating as it does the provision of extra sidings and special arrangements for working the traffic.

5. The waggons are frequently brought down the incline at Clay Cross too late for the same day's ordinary train, and necessarily remain until the following day; and, assuming the dates given by the Wingerworth Company of the waggons having been delivered upon the company's premises to be correct, but which we by no means admit, the delays may have arisen from one or other of the causes above stated.

6. The empty waggons are cleared out of the wharf every evening, and sent to the sorting sidings near Derby, where each coalowner's waggons are properly sorted and forwarded to their respective collieries by the trains appointed to take them.

It is much to be regretted that the Wingerworth Company did not write to me at the time of each delay; had they done so each case could have been investigated as it occurred, and if any just ground of complaint existed a remedy would have been applied.

Mr. C. H. Low.

Mr. Charles Hoskins Low examined.

13,881. (*Chairman.*) You are chairman of the general committee of the Bristol Chamber of Commerce?—I am.

13,882. Have you a statement which has been prepared by the timber merchants of Bristol and other persons, showing the unequal and unfair charges by the Great Western Railway Company for carrying timber over their system of railway to various places?—I have.

The witness delivered in the same, which is as follows:

MATTERS proposed to be laid before Her Majesty's Commissioners on behalf of the BRISTOL CHAMBER OF COMMERCE, by Mr. CHARLES HOSKINS LOW, Chairmain of the General Committee of the Chamber, February 1866.

1. A statement by the timber merchants of Bristol, showing the unequal and unfair charges of the Great Western Railway Company for carrying timber over their system of railways from Bristol to various places, in comparison with the charges made by the same company for timber carried from Newport (Mon.) A list of 34 places is appended hereto (A.) Taking the first on the list, Abingdon, it will be seen that the charges for carrying timber from Bristol to Abingdon, a distance of 71 miles, is 12*s.* per ton, whilst from Newport to Abingdon, a distance of 111 miles, the charge is 9*s.* 1*d.* per ton.

2. A complaint by the carriage manufacturers of the cities of Bristol and Bath of the injurious effects upon their trade consequent upon the high and almost prohibitory charges of the Great Western and the Bristol and Exeter Railway Companies for conveying charges on their lines. As an example, the memorialists mention, that the charge for conveyance of a carriage from Bath to London, which had been reduced from 1*l.* 19*s.* 8*d.* to 1*l.* 11*s.* 9*d.*, has latterly been again raised to the former rate, and that the same charge is made, whether it be a pony carriage weighing 4 cwt. or a travelling carriage weighing 10 times as much.

3. Communications from Messrs. Polglase & Co., of Bristol, wholesale tea dealers, complaining that, whereas formerly the Great Western Company charged 9*s.* 11*d.* per ton for rice from London to Bristol, they now charge 17*s.* 8*d.* per ton; and that it is now several years since they have found the London markets available; due in part to the difference in the cost of transit.

4. From Messrs. Chubb and Fry. A plan drawing and explanation of their proposed method of securing direct communication between passengers, guard, and engine driver, whilst the train is in motion.

5. From Mr. Peter Freeland Aiken, banker of Bristol, suggesting that the continental system of obliging passengers having luggage to be at railway stations 10 minutes before the advertised time for the departure of trains should be adopted in this country; the railway companies providing numbered receipts for the luggage. The suggestion, if carried out, it is considered would prevent confusion, loss of luggage, delays, and consequent accidents on railways.

The Committee of the Bristol Chamber of Commerce also offer the following suggestions:—

6. That the system of charging extra fares by "express" trains should be discontinued on all the lines.

7. That the ordinary fares might be greatly reduced to the benefit of the companies as well as the public.

8. That third-class carriages should be attached to all except express trains.

9. That smoking carriages should be set apart in each train on the principal lines, and the practice of smoking in other carriages should be strictly prohibited.

10. That passenger trains should be started at the advertised time, under a penalty, at the instance of any person who may lay the information.

11. That tickets should be sold at the principal stations and at their offices at any time; and that at every station, however small, tickets should be issued at least a quarter of an hour before the time for the departure of the trains.

12. That passengers with luggage should be required to be at the station 10 minutes before the time for the departure of trains, at least.

13. That passengers' luggage be registered and labelled, and a ticket given to the passenger corresponding with the label. It is considered that carrying out these suggestions (10 to 13) would tend greatly to ensure punctuality in travelling and consequent diminution of accidents, and other evils attendant on the present defective system of management.

14. That the Board of Trade should be empowered to revise the rates for passengers and goods on all railways, say every three years, and that the public should have a power of appeal to the Board of Trade at all times against excessive, unequal, or unfair rates and charges, including "terminals," the Board of Trrde being empowered to enforce their decisions after inquiry. This it is considered would be an effectual remedy for the very general complaints with respect to the arbitrary rates now enforced for the carriage of goods and merchandise, and the charges for "terminals." The remedy is one which is within the spirit of the legislation with respect to railways, all railway companies in return for the privileges conferred upon them being (nominally) bound to carry at equal rates, not exceeding a maximum fixed by the Act, at per ton per mile. But the intention of the legislature is in various ways very generally evaded, and the public have at present practically no protection or remedy against monopolies or combinations of railway companies. Various merchants, manufacturers, and traders, and various localities, are, in many cases, unjustly favoured, and others unjustly injured, by the present arbitrary and irregular practices of the railway companies.

Mr. C. H. Low
1 Mar. 1866.

(A.)

GREAT WESTERN RAILWAY COMPANY'S CHARGES for CARRIAGE of TIMBER per Ton for the Distance.

* In nearly every case traffic from Newport must pass through Gloucester.

13,883. You complain of the charges as compared with the charges from Newport?—Yes. I believe, to a great extent, the Cardiff rates are precisely the same as the Newport rates; that makes it rather a worse case, because Cardiff is 10 or 15 miles further west than Newport.

13,884. Take the first town in the list, Abingdon?—The rate from Bristol, a distance of 71 miles, is 12*s.* per ton, whereas the rate from Newport, which is 111 miles, is only 9*s.* 1*d.* per ton. I would remark also, that in thus favouring Newport as against Bristol we are doubly weighted and doubly disadvantaged, because Newport being a port of export and a shipping port for coal, vessels from New Brunswick and the Baltic will come to Newport at 1*s.* 6*d.* or 2*s.* per ton less than they will come to Bristol, so that not only do merchants get their goods at a considerably less freight into Newport, but they are able to send them with a free competition a greater distance at a less rate.

13,885. Does much timber go to Abingdon now?—It goes to all these places of which I have given a list. Didcot is another case; Didcot, which is 65 miles, is charged 10*s.* 10*d.* from Bristol. From Gloucester the fare is equal with Bristol; Gloucester is 60 miles and the fare is 10*s.* Newport is 104 miles, and positively the goods go from Newport through Gloucester and get to Didcot, so that the goods are literally taken from Newport to Gloucester for nothing, and even an advantage of 1*s.* 2*d.* given into the bargain.

13,886. (*Sir R. Hill.*) Does it cost less from Newport to Didcot than it does from Gloucester to Didcot?—The charge from Gloucester to Didcot is 10*s.*, and from Newport to Didcot it is 8*s.* 10*d.*, on the same line, running through Gloucester.

13,887. (*Chairman.*) Are there no additional services performed at Gloucester and Bristol, which are

Mr. C. H. Low.

1 Mar. 1866.

not performed at Newport?—No, these charges are from station to station in each case.

13,888. You deliver it at the station in both cases?—Yes.

13,889. And take it away in both cases?—And take it away in both cases.

13,890. Have you ever made any representation to the Great Western Company with respect to these charges?—We have not as to these charges; we were of opinion that if we intended to lay these charges before the Royal Commission it would not be right to bring it before the company. We have so often applied for new rates that we are really hopeless about the matter.

13,891. Is there any timber trade between Bristol and these places?—A large trade. I am myself a considerable timber importer into Bristol.

13,892. Is there any timber exported from Bristol into the country?—Yes; the local Bristol trade is comparatively a small trade as compared with that of the district we serve. We go as far north as Derby, as far east as Henley-on-Thames, and as far west as Exeter, so that we take a very large circuit.

13,893. Are you comparing exactly the same sorts of timber?—Yes, both Baltic and Canadian timber would be taken to those places. In nearly every instance some inequality exists.

13,894. What is the remedy that you would suggest as desirable to meet this case?—We consider that the Board of Trade should have some authority over the railway system generally, that they should have some power of revising the rates, and of seeing that such inequalities should not be allowed to continue. We recommend that the Board of Trade should be empowered to revise the rates for passengers and goods on all railways, say every three years, and that the public should have a power of appeal to the Board of Trade at all times against excessive, unequal, or unfair rates and charges, including "terminals," the Board of Trade being empowered to enforce their decisions after inquiry. This, it is considered, would be an effectual remedy for the very general complaints with respect to the arbitrary rates now enforced for the carriage of goods and merchandise, and the charges for "terminals." The remedy is one which is within the spirit of the legislation with respect to railways, all railway companies, in return for the privileges conferred upon them, being (nominally) bound to carry at equal rates, not exceeding a maximum fixed by the Act, at per ton per mile. But the intention of the legislature is, in various ways, very generally evaded, and the public have at present, practically, no protection or remedy against monopolies or combinations of railway companies; various merchants, manufacturers, and traders, and various localities are, in many cases, unjustly favoured, and others unjustly injured by the present arbitrary and irregular practices of the railway companies. I might observe, that the Bill which passed Parliament last session, namely, the South Wales and Great Western, which authorized the Severn Bridge, directed a maximum rate of 2*d.* per ton to be taken by the company; but by a private agreement with the coal owners a charge of three-eighths of a penny per ton from Wales to London was agreed upon. If they had enforced the rate of 2*d.* per ton to Bristol it would entirely have shut us out, because no coal would have ever come over the line to Bristol.

13,895. (*Capt. Galton.*) Are you speaking of 2*d.* per ton per mile?—Yes.

13,896. (*Mr. Hamilton.*) Is the rate of 2*d.* per ton per mile upon coal charged upon any railway?—They take power to charge it; I do not say that they do; that is their maximum rate.

13,897. (*Mr. Horsfall.*) What do you mean by saying that companies are nominally bound to carry at equal rates?—I believe, as a general principle, that they should not favour one class or one person as against another.

13,898. Where is that general principle to be found?—It was considered to be a general principle of legislation with reference to railways.

13,899. Is not the reverse of that statement nearer the truth, and that Parliament has only prescribed that railway companies shall not carry beyond a certain maximum, but below that maximum they are left to exercise their own discretion within certain rules and classifications which are laid down?—I believe that if they carry for one person to one place at a certain rate, that another person can compel them to carry for him at the same rate.

13,900. There is nothing to compel a railway company to charge the same price for 70 miles over every part of their line, is there?—Certainly not.

13,901. (*Chairman.*) They are not obliged to make the same charge to all persons under similar circumstances?—No.

13,902. There is nothing in their Acts to prevent them charging anything they like below their maximum if they think proper?—No.

13,903. They charge considerably below their maximum for timber from Newport?—Very much so.

13,904. (*Earl of Belmore.*) Are the words "maximum rates" used in their Acts of Parliament?—I am not quite certain; certain tolls are laid down which they cannot exceed.

13,905. If that is so, are they not at liberty to charge lower rates if they like to do so?—They are at liberty to do so, but we consider that it is prejudicial to the general interests of the country.

13,906. (*Mr. Hamilton.*) I presume you are aware that this power which you wish to be given to the Board of Trade would be a power in distinct contravention of an Act of Parliament, and in violation of terms imposed upon that railway, which that railway has accepted, and in reliance upon which it has expended its capital?—I was not aware of that. It becomes a very serious matter if for some reason of policy unconnected with commercial matters the railway is to carry from Newport at one half the price or a quarter of the price that is charged from other places.

13,907. You mean you wish it to be done if it can be legally done?—Quite so.

13,908. (*Capt. Galton.*) For how long have they been charging these differential rates between Newport and Bristol?—For a considerable time.

13,909. At the time of the Amalgamation Bill with the West Midland Company did you represent this to the Parliamentary Committee?—No, it seemed to have escaped our attention.

13,910. You did not then appeal to Parliament when you had an opportunity of doing so?—We did not; it did not come before us; it was only in consequence of finding Newport houses coming into what we had considered to be our own ground that led us to look into the matter.

13,911. You have not yet represented the matter to the Great Western Company?—We have not.

13,912. (*Chairman.*) Are you of opinion that the Great Western Company have any interest in Newport which would lead them to develop or encourage trade at Newport rather than at Bristol?—No, I have endeavoured to ascertain why such an inequality of charge should exist, but without success.

13,913. (*Mr. Hamilton.*) Is the competition by sea the same at Newport and at Bristol for the timber trade? Does the sea route from both the port of Bristol and the port of Newport offer the same amount of traffic to the Great Western Railway?—There is no sea route to the majority of places named in this list. There would be a sea route from Bristol on to Plymouth, or from Bristol to Exeter, and from Newport to Plymouth or Newport to Exeter, but of course there would be no sea route to Abingdon or the other inland places.

13,914. (*Chairman.*) Are there not any places in which Bristol has advantageous rates of some description, where it is carried a very long distance to Bristol at very low rates as compared with goods from other places?—I have heard Liverpool complain that Bristol is favoured as compared with them, and I believe that

the Bristol rates in many cases are lower than the Liverpool ones.

13,915. Then Bristol does not suffer disadvantages in all cases from the principle which the railway companies have adopted ?—Certainly not.

13,916. In certain cases they derive advantages from it ?—No doubt.

13,917. You think Liverpool has the same complaint against Bristol which Bristol has against Newport ?—To a certain extent it is counterbalanced by both Liverpool and Newport being export places. The per-centage of tonnage which takes outward cargo from Bristol is quite nominal, and consequently we have to pay a considerably higher freight in importing our goods than either Newport or Liverpool.

13,918. Have you very little export trade at Bristol ?—It is quite nominal.

13,919. You have also a complaint to put in from the carriage manufacturers of Bristol and Bath ?—I have.

13,920. What is the nature of their complaint ?—They complain of the very high rate of charge for carriages from Bristol and Bath to London, and more particularly the fact that the charge for the conveyance of a four-wheeled carriage from Bath to London, which had been reduced from 1*l.* 19*s.* 8*d.* to 1*l.* 11*s.* 9*d.*, has latterly been again raised to the former rate, and that the same charge is made whether it be a pony carriage weighing 4 cwt. or a travelling carriage weighing ten times as much.

13,921. Does it not take as large a truck to convey a small pony carriage as it would to take a travelling carriage ; in either case do they not have the same amount of dead weight to carry ?—Of course there would be the truck, but the dead weight would not be the same.

13,922. Would it be an inappreciable quantity ?—I cannot say. I dare say we might have been supplied with more evidence. We put an advertisement in the paper, and the coach makers sent us this communication.

13,923. It would take a truck to convey a pony carriage just the same as it would take a truck to convey a travelling carriage ?—Exactly.

13,924. It would be just the same as if you were sending a pony and a large horse ; you would equally have to find a horse box for the pony as for the large horse ?—Yes ; but you would pay more for two ponies than you would for one.

13,925. Would you pay more for the horse than you would for the pony ?—No.

13,926. That is exactly the same case, because you take up just as much of the trucks of the company ?—Quite so ; but the grievance seems to me that they have advanced the rate from 1*l.* 11*s.* 9*d.* to 1*l.* 19*s.* 8*d.*

13,927. (*Mr. Hamilton.*) Do you know when the advance was made ?—The memorialists say lately.

13,928. (*Mr. Horsfall.*) Are you aware what dividend the railway company is paying ?—Two per cent.

13,929. Do you not think it is probable that the directors raised the rates with a view of getting a better dividend ?—I think that is wrong policy altogether. I think that reduced rates of carriage both for goods and passengers would be far more likely to increase their dividend than reduce it.

13,930. (*Chairman.*) Can you give any reason why that would be the result of reducing the rates and fares ?—We find that when rates are reduced there is a very large increased traffic. I have not the figures before me, but I will instance the competition between Reading and London some years ago. When the return tickets were 2*s.* 6*d.*, they found that there was even a profit on that very reduced rate ; and although they have now gone back to the old rate, so far from increasing their dividend, there has been a large diminution. We generally find a large increase of traffic from the reduction of rates.

13,931. You are not able from any observation of your own to give any opinion as to what would be the effect of a reduction of rates ?—No.

13,932. Is the manufacture of carriages a large business at Bristol and Bath ?—It is.

13,933. Is it a question of importance to those towns ?—No doubt it is. I have a list of the principal carriage makers, and I find the number over 20 in the two towns. Some of them are men of considerable importance and have very large factories.

13,934. (*Mr. Hamilton.*) As they do not number more than 20 in those two large towns, it does not seem to be a very large trade ?—Some of them are in a very large way of business ; for instance, Rogers and Son and Fuller and Son.

13,935. Employing how many men do you suppose ?—I have no definite information upon that point.

13,936. (*Chairman.*) You have a complaint of a similar character from the tea dealers of Bristol, complaining that the charges on rice have been raised ?—We have. It has been raised from 9*s.* 11*d.* per ton to 17*s.* 8*d* per ton, which is nearly double.

13,937. Has the consequence been that they are no longer able to send any rice to London ?—They say they are quite shut out from the London market in consequence.

13,938. (*Sir R. Hill.*) The expression in your statement is "due in part to the difference in the cost "of transit." What is the other part that it is due to ?—I am not advised as to that part. I have not observed the expression "due in part." I have no question that on an article like rice an advance of 8*s.* per ton would preclude any profit on the article.

13,939. When was the advance made ?—I have not the particulars.

13,940. You do not know the circumstances under which it was made ?—No, I do not.

13,941. Has no inquiry been made of the company why it is that there was such a very large increase ?—I am informed that they have repeatedly applied for a reduction, but can get none.

13,942. Is Bristol a large import market for rice ?—We do not import it. We have little or no East India trade.

13,943. Why should you suppose you will be able to compete with ports of import in supplying London with rice ?—We do not ; it passes from London to Bristol.

13,944. You mean you cannot get rice ?—We cannot buy rice in London.

13,945. (*Chairman.*) Where is Bristol supplied with rice from ?—I think chiefly from Liverpool.

13,946. (*Mr. Hamilton.*) Do you know what is the rate from Liverpool to Bristol ?—The rate by water would be about 9*s.* per ton.

13,947. Have you any observations to offer with regard to the suggestion from Mr. Aiken ?—It seems to us that delay in railway travelling does arise to a great extent from receiving luggage up to the very last moment. At present 20 or 30 passengers may drive up to a station with a large amount of luggage one minute before the time of the starting of the train, and then the company are obliged to take them. The same thing may be repeated at half a dozen stations, which consequently must delay the train half an hour at least.

13,948. Do you not think it would give very great dissatisfaction if passengers were excluded who arrived a minute or so before the advertised time of starting the train ?—I have no doubt that at first there would be great complaints. I am merely referring to luggage which cannot go in the carriage ; heavy parcels of luggage.

13,949. Do you think the public in general, so far as the town of Bristol is concerned, would be disposed to adopt a rule of that kind ?—I think they would find the advantage so great that they would rather be 10 minutes before the time.

13,950. (*Chairman.*) Have you any observations to offer on the suggestions of the Bristol Chamber of Commerce ?—As to No. 6, we suffer considerably from the very high fares by express trains by the Great Western. We have no express fares on the Midland Railway at all. I find that the express first-class fares

Mr. C. H. Low.
1 Mar. 1866.

are 25 per cent. above the ordinary first-class fares, and the second-class express fares 16½ per cent. above the ordinary fares. I also find that we are almost compelled to travel to London by the express, because no ordinary train arrives in Paddington before 2.40, which by the time one gets into the city is too late to do any business, so that we are compelled to pay the express fare. I also find that by the third-class passengers cannot arrive in London before a quarter to six in the evening, so that in order to return in one day you must leave London at 3 o'clock in the morning, and get back by 2 the next morning; so that third class passengers are virtually shut out from going to and returning from London in the same day.

13,951. (*Mr. Hamilton.*) Are you quite sure that the third-class passenger cannot get from Bristol to London before a quarter to six in the evening?—I have examined the time-table.

13,952. (*Chairman.*) Do you think any large number of third-class passengers would wish to go to London and return the same day? Would not those passengers be more the class of persons who travel by the first and second class?—Many people might, for cheapness, if the time suited them, elect to go by third class.

13,953. You think it is in order to compel all persons who wish to go up for business in the day to travel by the second class rather than by the third?—I think so. I can give a singular instance of the inequalities of the passenger rate. I went to Oxford by the express train from Bristol, and then from Oxford to London, which is a *détour* of about 30 miles, and it cost me 2*s.* less than taking a direct ticket from Bristol to London.

13,954. Are express fares charged from Bristol to Oxford?—I think not. Still we get out at Didcot; we return to Didcot.

13,955. I suppose the railway company are authorized by their Act of Parliament to charge express fares?—26*s.* 1*d.* is the express fare from Bristol to Paddington; that is the extreme maximum rate by first class.

13,956. Do you think any great convenience would arise if your suggestion No. 11 were adopted, that tickets should be sold at the principal stations and offices at any time?—We consider that that would be one of the great points tending to greater punctuality in the starting of trains. We find with regard to the morning train that the ticket clerk does not make his appearance until five minutes before the arrival of the train, and consequently a great delay occurs in starting the train.

13,957. (*Mr. Glyn.*) Is there not a general regulation that the clerks should be at the ticket office a quarter of an hour before the starting of the train?—Yes.

13,958. Then is not that rather a matter on which you should complain to the company than to this Commission?—We are not complaining of their non-attendance. We consider that the fact of tickets being purchasable at other places besides the railway station would tend to facilitate business; excursion tickets are always purchasable at other places, such as the parcels offices for instance.

13,959. (*Chairman.*) Are there any other points on which you wish to offer any opinion?—There are not.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Friday, 2nd March 1866.

PRESENT:

THE RIGHT HON. THE EARL OF BELMORE.
T. B. HORSFALL, ESQ., M.P.
GEO. CARR GLYN, ESQ., M.P.
CAPT. DOUGLAS GALTON, R.E., C.B., F.R.S.
J. R. M'CLEAN, PRES. INST. C.E.
WILLIAM POLE, F.R.S., *Secretary.*

HIS GRACE THE DUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

Mr. THOMAS MACNAY examined.

Mr. T. MacNay.
2 Mar. 1866.

13,960. (*Chairman.*) You are Secretary to the Stockton and Darlington Railway Company?—Yes.

13,961. That company is now amalgamated with the North-eastern Company?—Yes.

13,962. What is the precise position of affairs between the Stockton and Darlington Company and the North-eastern Company; in some respects I believe you are still partially independent?—Yes; as regards management we are quite independent; the carrying on of the traffic and the working of the railway is under the Stockton and Darlington directors as it was prior to the amalgamation. In all other respects the two companies are amalgamated.

13,963. The general manager of the North-eastern Railway has nothing to do with the working of the traffic on the Stockton and Darlington?—He does not go into the details of it; of course he feels an interest in the working of it, but he cannot speak to it.

13,964. Have you seen the evidence given by Mr. Wooler before this Commission?—I have.

13,965. He has made certain charges affecting the Stockton and Darlington Company?—I have observed that.

13,966. Have you prepared a statement in answer to some of his charges?—I have prepared an answer to the whole of them, as I thought they required an answer.

13,967. One complaint that Mr. Wooler makes is, that the directors who own collieries have preferences shown to them over other colliery owners?—Yes, and I have stated in my answer that that is not the case. I have been connected with the companies for upwards of 30 years, and I have been secretary for a large portion of that time. I am not aware of any regulation ever having been issued that was not intended to apply to the whole trading public connected with the line equally; that statement has been made under a mistaken impression.

13,968. Have you reason to believe that your instructions have not been duly carried out by the agents; do you think that the agents have taken upon themselves to give practical facilities to the colliery owners, who are directors, which they have not given to others?—In a large undertaking like ours, of 200 miles, such a thing might occur without its coming to my knowledge; they are not encouraged to do so, but on the contrary to deal out the rules and regulations impartially.

13,969. Has Mr. Wooler ever complained to you or to the directors of your company?—Yes, he has.

13,970. On that point?—Yes; there have been complaints, and upon a line like ours there will be complaints as long as ever there is a large trade to carry on. When prices are good every one wants to do the largest amount of business. In the case of Mr. Wooler he talks about getting a supply of waggons, and he states that he has a colliery, and he became connected with it about seven years ago, about 1859. In that year he sent about 5,600 tons of traffic along the line, and he has been allowed to go on increasing it till the last year, 1865, he sent 72,000 tons. There is not another coal owner on the line that has had so large an increase as that. With regard to those collieries which Mr. Wooler says belong to the directors, and in

which they are interested, I do not find that any of those collieries have increased one-tenth of that proportion.

13,971. When complaints have been made have they been investigated by the board?—When a complaint is made it is not always investigated by the board, it would be almost impracticable; but they are always investigated to see if the complaint can be remedied, or if it is justifiable; if it is a complaint of some magnitude and required their attention, then the board would give attention to it.

13,972. (*Mr. Glyn.*) The Stockton and Darlington Company act quite independently of the North-eastern board, now?—They only act independently as regards the management of their own 200 and odd miles of railway, and the management of the traffic is in their care. The North-eastern board interfere very little with them.

13,973. In fixing the rates or the allowances, by which board is that done?—If there is to be a reduction of the rates the Stockton and Darlington board cannot reduce them without the consent of the North-eastern board.

13,974. Or make any allowances without their consent?—No; except it is something of not sufficient importance to occupy the time of the board with, in which case they would do it, if it was considered to be for the general interests of the company.

13,975. In point of fact the powers of the Stockton and Darlington board now are confined really to the management and the working of the traffic on the line?—Yes.

13,976. Their powers do not extend much beyond that?—No.

13,977. They are obliged to have reference to the North-eastern board in all cases affecting the rates?—Yes; in all cases of important changes they have recourse to the North-eastern board.

13,978. Suppose a question arose as to altering the aggregate quantity of tons to be sent per annum by any particular colliery owner, could that be done by the Stockton and Darlington board alone?—As to the quantity to be sent by any particular colliery that would be settled by the Stockton and Darlington board.

13,979. I mean that quantity which would entitle them to a rebate?—That would be settled by the Stockton and Darlington board, because that has been in existence for many years, therefore they would be simply acting upon the rule which was in existence at the time of the amalgamation.

13,980. Supposing it was desired to change that proportion from 20,000 to 40,000 tons per annum, could that be done by the Stockton and Darlington board alone?—I almost think it could.

13,981. (*Mr. Horsfall.*) How many companies send 20,000 tons?—The bulk of them send upwards of that quantity now; but that has reference to the agreement to which Mr. Wooler refers. He laid great stress upon that resolution, which was passed for the carrying out of that rule that was laid down in 1856. The resolution was, that any one sending 20,000 tons or upwards should have a rebate, which has been already pointed out. That resolution was sent to every colliery to enable him to make a contract on that basis, but the trade having so largely extended by the opening of the ironstone and iron works, the directors last November passed another resolution to cancel the former one, and to let all the collieries have the rebate. Mr. Wooler had the benefit of that prior to that time; he has not said so in his evidence, I see, but he had the benefit of that from September last.

13,982. There is no limit now to the quantity of coal that may be sent to entitle the party to a reduction?—No.

13,983. (*Mr. Glyn.*) Even when that regulation existed, if I rightly understand you, several colliery owners might have united together in order to make up the necessary quantity to obtain a rebate?—Yes; there was a great desire on the part of the directors to encourage the extension of the coal trade. There were royalties undeveloped, and therefore, they said, you who cannot do it singly, if you unite you shall have the benefit. Then the trade went on extending, and the opening of ironworks became so large that they said, we will not keep this regulation in force any longer, but we will let any colliery that sends coal and coke for iron-making purposes have it at the low rate at once. Therefore, we do not charge the high rate and then make a rebate, but just charge the low rate to each one. That has been so since last November, and Mr. Wooler has not paid the higher rate, I believe, since last September.

13,984. (*Chairman.*) If Mr. Wooler sends such a large quantity of coal as 70,000 tons a year, how is it that he ever suffers from that rule; was he not always entitled to a rebate?—When he commenced the colliery he was only sending 5,600 per annum; that is seven years ago.

13,985. Latterly was he not entitled to a rebate, before you made that rule universally applicable?—Yes; and he got it.

13,986. Do you still allow any rebate for large quantities of coal sent, not for iron-making purposes?—No, there is no regulation affecting that.

13,987. For large quantities of coal and coke now there is no difference made between large and small collieries?—No; I do not think so.

13,988. In no case is there any difference made?—No. If a colliery owner came to us to make a proposal that he could bring a large trade, seeking to get connexions abroad, and he said, if you will encourage me in this I will go and try on the continent to open out a connexion, we should be disposed to listen to that, and encourage it.

13,989. (*Mr. Glyn.*) You would found that upon the delivery of a certain quantity to be brought to you for carriage?—Yes.

13,990. (*Chairman.*) Mr. Wooler made some complaint that when he attempted to send coke to Glasgow he found that he was undersold, that he could not carry on a trade to any advantage owing to your charges?—Yes. I was surprised at the way he put it; he is evidently misinformed. There has not been a ton sent along our line to go to Glasgow by any of the directors. I believe Mr. Pease has sent coke from the North-eastern Railway round by Newcastle, and so on to Carlisle, and to Glasgow, and he is now sending some, I believe.

13,991. Coal or coke?—Coke. That is going on now; but Mr. Wooler when he sent that coke which he spoke of, sent it from a seam called Five-quarter Seam, so inferior a quality of coke for iron-making purposes, and especially for foundry purposes, that when it got to Glasgow the people of Glasgow would not have it; they said they could not take it at any price, that it was not of a sufficiently good quality to suit their purpose. It might have damaged their business, I suppose.

13,992. Mr. Wooler says that a neighbour was selling in competition with him, and I suppose he wishes it to be understood that his neighbour made a good profit out of his business, and that he was not able to do so?—Yes; he states that. That entirely arises from the quality of the material, and I do not think that he would now have offered to send coke, as there is no inducement. The consumption of coke in our neighbourhood is so large that I think he scarcely would have offered to send it, but he had some waggons on hand, and wished to secure that sale, and they were to be delivered in Scotland, the cheapest thing for him to do was to fill them with coke and send them "ex waggons"; they would thereby be delivered free; if he had sent them empty over our line and over the Carlisle line there would have been a charge.

13,993. (*Earl of Belmore.*) He in fact only sent coke once?—Only that once; 40 tons of it.

13,994. (*Mr. Horsfall.*) What is your mileage rate on coke?—$\frac{3}{4}d.$ per ton per mile.

13,995. (*Mr. Glyn.*) The colliery owner finding the waggons?—We find the waggons in that charge; they are included in the $\frac{3}{4}d.$

13,996. (*Chairman.*) It is the general practice, I believe, on the whole of the North-eastern system, in-

Mr. T. MacNay.

2 Mar. 1866.

cluding the Stockton and Darlington line, for the company to find the waggons?—It is not universal; the Great Northern Company send waggons, and some of the colliery owners send waggons.

13,997. As to the coal that is delivered in districts on the North-eastern line itself, is that traffic all carried in waggons belonging to the company?—Chiefly so.

13,998. In some instances the colliery owners find the waggons?—Yes.

13,999. We have heard that in most other parts of England the almost universal rule is for the colliery owners to provide waggons?—That is not the case with us. There was a time when the colliery owners found the waggons on our line; but where there were about 60 collieries with different kinds of coal in each colliery it was a very serious matter to have to shunt the waggons for every one of those places, and involved the company in great expense. There was consequently great delay, and it was found better to put them all into one stock, and the company bought them.

14,000. As a general rule at the present time you find the waggons for the coal traffic?—Yes, that is so.

14,001. (*Mr. Horsfall.*) Do you think that any reduction in the rate upon coal would materially increase your traffic?—I do not think it would at present; we have considered that $\frac{3}{4}d.$, including the waggons, was a very moderate rate, and would give it a full chance of development, and in fact it has.

14,002. Have you ever tried the experiment of a reduction?—I think we have not gone below that for coal and coke for local consumption.

14,003. There is not much passenger traffic on your line, I believe?—We carry about a million passengers per annum.

14,004. What is the rate per mile on your line?—2*d.* first class, and $1\frac{1}{2}d.$ second class; of course the parliamentary train is 1*d.* I should explain that that was our rate when we were a separate company. After the amalgamation with the North-eastern Company we assimilated our rates to theirs, and brought them to $2\frac{1}{2}d.$ for the first class. There is a change now going on to bring it down to 2*d.* again over the whole of the North-eastern system, so that they are really coming from their previous charges to our previous charges.

14,005. That would rather raise the charge?—It did raise it at the time by making it from 2*d.* to $2\frac{1}{2}d.$ for first-class passengers, after the amalgamation. Now they have decided at the North-eastern board to reduce the rates to 2*d.* gradually—a part of that reduction has already taken place; but we have given the public a consideration for that advance—we give them return tickets from their stations to all others every day, which they have not had before.

14,006. (*Chairman.*) Your district is a very populous one, on the whole, is it not?—Yes, it is a large iron-making district, gradually increasing in population.

14,007. (*Earl of Belmore.*) What rate of reduction do you make on return tickets?—About a fare and sixth is the charge.

14,008. (*Mr. Horsfall.*) Do the labouring population travel much by your line?—Not so very much the labouring men; I should say not so largely as in some places, but still necessarily a large proportion travel because there is such a large population of that class.

14,009. Do they live far from the works, and travel up and down the line?—Not a long way. They live so near to the works that there are few instances of men having to go by trains to their work regularly. If they have work at a distance they have occasion to travel then by the line.

14,010. (*Chairman.*) Did you say that Mr. Pease was now carrying on a considerable coke trade with Glasgow?—I think not a considerable trade, but he is sending something; it does not go on to our line at all, consequently our directors have nothing to do with it, and that was the mistake, I think, in the statement.

14,011. (*Mr. Glyn.*) It does not go over the Stockton and Darlington line at all?—No, it goes by the North-eastern, I think, on to the Newcastle and Carlisle, and that way, so that I do not know how he made that mistake in saying that there were both the directors and himself sending in that direction.

14,012. (*Mr. Horsfall.*) What difference of rate do you charge between coke and coal?—Hitherto we have kept the same rate on our line, although it is a very serious matter. A waggon that would carry three tons of the one will only carry about a ton and three-quarters of the other, but still we have adhered to the same rate. A large portion of our traffic is coke traffic, so that that really amounted to a reduction to the public.

14,013. What dividend does your company pay?—The last dividend was $9\frac{1}{4}$ per cent. for the Stockton and Darlington section.

14,014. (*Mr. Glyn.*) You say that Mr. Pease sends his coke by the Newcastle and Carlisle line, and Mr. Wooler said he sent it by Tebay?—Yes. If he sent it over our line we would have taken it to Clifton and not to Tebay.

14,015. (*Earl of Belmore.*) Did you say that the quantity of coke and coal was as three tons to one and a quarter tons or one and three-quarters?—One and three-quarters.

14,016. (*Chairman.*) In answer to question 9,620, Mr. Wooler makes complaints as to the supply of waggons for his trade. Have you any observations to make on that statement?—I notice that he says when he is standing at his colliery he can look across the valley and see waggons standing at some other person's colliery unoccupied; now at a large colliery they have coke on the benches, and they may fill so many waggons, and then they are moved forward to other benches, and I think the waggons must have been waiting to be transferred either by locomotives or horse power; he does not give any of the circumstances. At a time when the prices are good, as they all have been for some time past, every coal owner is clamorous to get all the waggons he can to do the most business he can, irrespective of his neighbour's interest. As I have said, on looking at the list of traffic carried, Mr. Wooler's quantity has increased about 13 times what it was seven years ago, and there is not another instance where the quantity has increased the same. As regards the directors' collieries, they have not increased one tenth of that, so that I think he had not calculated his figures very closely when he said that.

14,017. Have you any standing rule as to supplying waggons to separate coal owners; when a demand for waggons is sent to you, and you can supply them, do you divide them proportionally to the demand, or by any other regulation?—That is a thing which it is very difficult to regulate. If collieries send away a certain quantity we endeavour to make the waggons bear some proportion to their capabilities, but it is very difficult to meet that; they make their own allegations as to their capabilities.

14,018. (*Mr. Glyn.*) You do not attend to the first application as a matter of course?—We look to see what their prospects are, because the consumers send to our people to tell them if they want any, and sometimes the coal owner will come before we have had any intimation from the consumer that he wants coke, and the coal owner would like us to send the waggons and get the coal or coke sent away notwithstanding.

14,019. (*Mr. Horsfall.*) How many passenger trains do you run daily?—On the main part of the line about eight each way.

14,020. And on Sunday how many?—None on Sunday except the mail trains; we have never run Sunday trains.

14,021. (*Capt. Galton.*) Mr. Wooler says that you give an undue preference to other colliery owners. In answer to question 9,636 he complains that he applied to you for waggons two or three consecutive days, and that he was unable to send some coke to be shipped, and that some of the directors' coke was then taken which was sent down to the dock or was lying there?—Yes.

14,022. He considers that that was a case of undue preference?—Yes, it was for shipment. I think, he

says, "I would mention another case which occurred "about the same month. There was a shipper who "ordered some coke; he came up and saw me on the "Friday evening, and he asked whether I would send "it down on the Saturday, and he would have a ship "ready for taking the coke on board by 12 o'clock on "the Saturday. We communicated with the railway "company at once, to put in a supply of waggons for "that purpose; but they put none in on the Saturday. "We applied to them on the Monday, but they put "none in on the Monday." It turned out that this ship could not get into the dock; it was too wide.

14,023. Then he says, "Then on the Tuesday they "put them in, but the ship which was lying alongside "ready to take them in, was coming on to demurrage, "and the shipper went and bought director's coke that "was then down at the dock waiting for a ship that "was not in the dock, and was not in the dock "for some days afterwards, and he gave 1*s.* a ton "more than he would have given to me for it"?—We caused inquiry to be made into that by our agent, and we cannot make out that there has been such a case.

14,024. He next complained that "the mineral "manager was a part owner of a small colliery which "loaded at the same siding as my other colliery," and that he got waggons when Mr. Wooler could not get them?—Yes, and there he is mistaken again; he never was the owner of a colliery until he gave notice to quit the company's service; there might have been two or three weeks before he went away, but what he has stated is a mistake.

14,025. Would there be any objection on the part of the company to their officers being owners of any collieries, or having shares in them as part owners?—No; I do not think there would, because the regulations that are made with regard to these things are made at the board, and apply to all parties equally.

14,026. An officer could not give an undue preference?—No; or if he did, there would very soon be a remonstrance about it, and the matter would be adjusted.

14,027. (*Mr. Glyn.*) I do not know whether you have observed that Mr. Wooler fixes the actual date to which he referred, the 22nd or 23rd of March. Was he part owner of a colliery at that time?—He left us in June. I think it is very likely that he would have been part owner of that colliery, because he had given us notice to leave, and it was shortly after that he took an interest in the colliery. But I am told it was only a small interest. He had not the adjustment of the waggons, as to the number, that matter was only partially in his care; there are men located at the collieries and the ironworks, and they make the arrangements as to the waggons according to the rules and circumstances, and it rarely went through his hands exclusively.

14,028. He stated in answer to a question that follows, that he had the entire ordering of the waggons. You contradict that?—He had the entire regulation of the waggons as regards the general rules; but as regards the details of sending waggons to the several collieries, I should say it was very rare that he was either present or gave any instructions as to them in detail.

14,029. He could not make a disposal of the waggons to one particular colliery to favour his own purpose?—I do not think he would do so.

14,030. (*Chairman.*) Has this person left the employment of the company for some time?—Yes, since last June.

14,031. Have any complaints been made that he was favouring particular collieries?—No, that is the only instance I have heard of; he was a very efficient agent, and I suppose he thought he could do better for himself, and therefore left us.

14,032. I see in answer to question 9629, that Mr. Wooler states, "In 1864, and up to the end of last "month, we had 7,766 waggons short of the orders "that came into the colliery." Do you think that that is likely?—I do not know; but he has got such a large amount of traffic that he seems to have got much more than his share at times.

14,033. (*Capt. Galton.*) More than his share of the traffic, or more than his share of the waggons?—More than his share of the traffic. He told you that he took the colliery seven years ago, in which year he sent 5,600 tons, and he has gone on by the waggons having been sent to him, until it has amounted to 72,000 tons a year.

14,034. If he has acquired that trade by his energy and perseverance, why do you think he has had more than his fair share?—That is the point we are upon, how to measure it; in that case every other coal owner would do the same thing; they say, when the prices are so high, we will all develop our own collieries more extensively.

14,035. But do you think that the railway company should hold the balance between different colliery owners?—They should have a view to equality and equity between the parties.

14,036. That is, stepping in between the coal owner and the energy displayed?—That is not the point; it is not stepping in between the coal owners and the energy displayed by him, but interfering between him and his taking the rights of other people, because if he finds that he can force his coke or coal into the ironworks, and keep some one else's out, he will struggle to do that.

14,037. (*Earl of Belmore.*) Would not the difficulty be met by the coal owners providing their own waggons?—That is impracticable upon a line where you have so many different collieries, and so many different kinds of coal.

14,038. (*Capt. Galton.*) I suppose with the enormous number of waggons that are required to work the traffic, it would be almost impossible to work it if the owners found the waggons, whereas if you owned the waggons you might be able to carry a very much larger quantity of coal with the same number of waggons than you could if the waggons belonged to different collieries?—That is so.

14,039. You could send any number of waggons you liked to any one colliery that wanted them; whereas if the owners had their own waggons you must always send out the owners' waggons, and take them back to their own collieries?—Yes.

14,040. (*Chairman.*) Is there much competition between the different collieries in the way of disposing of their coals, or can the whole quantity raised be disposed of without much difficulty?—When the prices are good, every one struggles to send all he can, and when the prices are not good, the railway companies may do as they can. Some years ago when the prices were not good all the traders tried to slacken their operations, and it had such an effect that every railway company had a surplus of rolling stock. I remember that I attended a meeting at Tebay, and some of the parties there asked if we had any sidings that we could spare to let them put some of their waggons on, and we said, no, that we had filled all ours, and in that case neither the coal owners nor the ironmasters sympathized with the railway companies in the least.

14,041. (*Mr. Glyn.*) Will you state what number of waggons you have on your line?—We have 15,000 chaldron waggons, and 2,000 or 3,000 other mineral waggons.

14,042. What is the largest quantity that you carry in any waggon?—Eight tons in the large ones.

14,043. (*Capt. Galton.*) Why do you prefer chaldron waggons?—We do not prefer chaldron waggons now; but when this line was commenced 40 years ago, they were all chaldron waggons taken from the old "waggonway," and we have kept on increasing the number. We found that those waggons were adapted to our shipping places, which was our great trade then, and, therefore, we have kept to the chaldron waggon as being more portable, and easy to move about.

14,044. The coal which has to go inland for any distance, I suppose you put into the large waggons?—Yes.

Mr. T. MacNay.

2 Mar. 1866.

14,045. You use chaldron waggons for shipping purposes solely?—Yes, as near as we can.

14,046. (*Chairman.*) At the ironworks in North Yorkshire, do you use large waggons or small waggons?—Large waggons; in fact, we have now decided that large waggons are so much more generally useful than small ones that we are gradually putting the chaldron waggons out of use.

14,047. (*Capt. Galton.*) Can you run chaldron waggons in the same trains with large waggons?—Yes; but we have double buffers on the large ones, so that they will buff with either the large or the small, without that, it smashes the little ones to pieces.

14,048. (*Mr. Glyn.*) Do you increase your complement of waggons every year?—Yes. At this time we have orders out for waggons and locomotives that will cost about 120,000*l.*

14,049. (*Capt. Galton.*) Is that about the annual increase of your waggons?—No; it is going on more rapidly just now because there is a large number of ironworks being opened.

14,050. In answer to question 9659, which is, "You consider that the great inconvenience which is "suffered in your particular district arises from the "directors or the officers of the company being men "in business themselves in which carrying is an im- "portant element?" the witness says "Yes." Is it the case that all the directors are mixed up with the business in which carrying is an important element?—There are several of them.

14,051. Do they get any undue preference?—They get no undue preference; but I rather think that in many instances it has been the contrary way. I do not know what restriction Mr. Wooler refers to, because I have already stated what proportion he has got in the way of increase, and what proportion the others have got, which is largely in his favour.

14,052. Still an undue preference may occasionally have been given?—Of course such a thing is possible; but I am not aware of it. I am not aware of any encouragement having been given from head quarters in any way to adopt such a course; it has been studiously avoided.

14,053. (*Chairman.*) Is a large proportion of the directors of the Stockton and Darlington Railway interested in the district as colliery owners?—A great many.

14,054. As colliery owners?—Yes, several of them as colliery owners.

14,055. Should you say the majority of the board?—I would scarcely say so large a proportion as that; but there are several; and they certainly have been the people who have developed the district, and we were glad to have it so developed.

14,056. (*Mr. Glyn.*) They made the railway?—Yes, and they opened out the whole place, and we were very glad to find them ready to develop the resources of the country.

14,057. (*Capt. Galton.*) The Stockton and Darlington Company take part in the management of their own line notwithstanding the amalgamation?—Yes.

14,058. What was the reason of their retaining the management?—They had been accustomed for over 40 years to manage the line, and they did not like to give it up; they thought they could manage it as well as anybody else.

14,059. What does the management consist of; is it the arrangement of the waggons, and so forth?—Yes, and conducting the traffic, buying the materials, the appropriation of those materials, and the arrangement of the rates, so far that if a person came and asked, what is your rate from one place to another, if we had one we should quote it; but if there was an application to make a reduction of the rates, we could not do that without the consent of the North-eastern board.

14,060. (*Chairman.*) I will now go to question 9679, and you will see there the complaint that Mr. Wooler makes in his answer to that question; that is, with regard to coke in the winter of 1860?—Yes, sending coal to York.

14,061. I think the charge is that they found they could get 3*s.* a ton more by sending it for household purposes, and they kept the furnaces short of supply?—Yes; he says, "The Stockton and Darlington Com- "pany had a number of small waggons, for they worked "the traffic chiefly at that time in chaldrons, three-ton "waggons, which were inefficiently wheeled, made of "cast iron, and they could not stand a rapid transit. "He sent down a very large quantity of coal on to the "North-eastern line." That coal was sent to York, and this is a letter which I received, and which I believe explains the thing better than anything I can say. Captain O'Brien wrote to me to see if we could send them some chaldron waggons to York with coal.

14,062. (*Mr. Glyn.*) What is the date of that letter?—28th December 1860. He says, "We are very short "of waggons for the land-sale coal trade, and I am "really afraid, as the water communications are frozen "in some cases, of the depôts being out altogether. "I understand from Mr. Bailey that you can put sixty "of your three-ton coal waggons into our depôt trade for "a time; this will be some relief, and oblige us greatly. "I should be greatly obliged in addition if you could "let us have as many of your chaldron waggons as you "can possibly spare, not only on the Mondays, but on "any other days. We would have them loaded for "our main line only, and the engine that brings them "should take them back again. If we have not "engine power, at hand, perhaps you will have no "objection to your engine running through, but on "this I will write you again, or our Mr. Bell, at Dar- "lington, shall be properly instructed and authorized "to communicate with your officers." He says it would be some relief. There was such a very severe frost set in that there seemed a danger of there being a panic at York for want of coals for the poor people. At that very time there was a coal owner not a director, the late Mr. Nicholas Wood, who made a complaint that he was not getting a fair share of that coal to York; and this is my letter in reply to Captain O'Brien: "Dear Sir,—I received your two messages "as to Mr. Wood's complaint. I have ascertained that "the waggons which were agreed to be furnished to "your company have been apportioned exactly in the "way that your Mr. Bailey pointed out, which gave to "the Black Boy Colliery (Mr. Wood's) about one- "fourth of the lot. I have arranged with our mineral "agents to give you all the waggon accommodation "possible."

14,063. (*Capt. Galton.*) Mr. Nicholas Wood complained that he did not get a fair share of the waggons?—He thought so, but he had got 25 per cent. of them, and that seemed more than a fair share.

14,064. Did any other person get another 25 per cent., or more?—I do not know who got the others, but this lasted only a short time; it was not the interest of the Stockton and Darlington Company to send the coal to York, for we were sending our traffic off our own line; we were not at that time amalgamated.

14,065. It was not your interest to send it off the line?—No; and we could have kept it on, but it had nothing to do with any directors.

14,066. (*Mr. Horsfall.*) Has there been much increase in the traffic during the last few years?—Yes; it has been gradually increasing. We send, I think, about six millions of tons of minerals along our line per annum.

14,067. As compared with the preceding years what is it?—I do not recollect. The district has enlarged, and the coal traffic, since 1859, has increased from about two millions of tons to upwards of three millions of tons of coal and coke.

14,068. I thought you said that last year it was six millions?—Yes; that is, including the ironstone, and all other minerals. This is the coal and coke only.

14,069. What was it in the preceding year of 1859, including the coal and the ironstone. You made a comparison just now between 1859 and 1865, and in the one year you gave us the aggregate traffic in minerals, and in the other year you only gave us that appertaining to coal?—Yes; speaking off-hand I think

it would be upwards of five millions of tons as compared with about six millions of tons, say 5,300,000. I am speaking without the figures before me.

14,070. (*Capt. Galton.*) Have you many different rates upon your line?—There are a great many different rates. There is a peculiarity about our traffic that does not exist perhaps on any other line.

14,071. What is that peculiarity?—We have so many collieries, and so many receiving places, and so many varied kinds of traffic.

14,072. Varied kinds of coal traffic?—Yes; there is the Five-quarter Seam, the Brockwell Seam, the screened coal, the unscreened coal, the round coal, and the small coal.

14,073. Do you charge a different rate for each of those coals?—Not in every instance. Sometimes the consumer says, that if he had a low rate he could take some refuse small coal to be consumed at the works, and if it would create a traffic we should try to give him a low rate.

14,074. Your rates, I suppose, vary from day to day almost?—Not so much as that.

14,075. (*Chairman.*) Is there much difference in the mileage rates for the same quality of coal between different places. To some places do you charge much less per mile than to others?—Do you mean depending upon the length?

14,076. Yes; or other circumstances?—There is not a great deal of difference.

14,077. You say, as a general rule, three farthings a ton is what you charge?—Yes.

14,078. Is that charge pretty nearly uniform over the whole of your system?—Yes.

14,079. (*Mr. Glyn.*) You make a different rate, I presume, for shipping purposes?—Yes; and a little different for land sales for household purposes.

14,080. Are there terminal charges besides the $\frac{3}{4}d.$ per ton per mile?—No.

14,081. That includes terminals?—Yes.

14,082. Have you any depôts or wharves for which you charge rent?—For household purposes we have; but the $\frac{3}{4}d.$ I have referred to applies to the iron making, which is the bulk of the traffic.

14,083. Is the charge rather higher for household pusposes?—Yes, varying from $1\frac{1}{4}d.$ to $1\frac{3}{4}d.$; if it has to travel short distance that is the rate, but for 25 or 30 miles we should charge a little less.

14,084. Do you carry much coal to a considerable distance from your own place?—The average distance from the collieries to the chief place of consumption, which is down in Cleveland, will be about 30 miles.

14,085. Do you send household coals to any considerable distance away from where they are raised?—Yes, we have sent some to York, which is on the North-eastern section of the line, and there is some household coal that goes to York.

14,086. You send coal for household purposes into Lancashire and Westmoreland?—They have got very little of that traffic. Kendal got some, I believe, at one time.

14,087. That goes by the line from Barnard Castle to Tebay?—Yes, and that traffic going for household purposes carried those long distances is taken below the rates I have mentioned, and the same with the York traffic—that is cheaper.

14,088. (*Mr. Horsfall.*) What is the charge upon that?—Only about $1d.$, if I recollect rightly; some of it goes up to York I think at about from $\frac{3}{4}d.$ to $1d.$

14,089. *Capt. Galton.*) Should you find it difficult, do you think, to publish the rates upon your railway?—I think it would be to publish every rate.

14,090. Would there be any objection to having those rates entered in a rate book so as to be accessible to the public?—I do not know that there would be anything objectionable about it; but they get to know each other's rates well enough.

14,091. Mr. Wooler suggests in one of his answers that the rates should be published, as he thinks?—Yes.

14,092. He says, it is the spirit of the law to have them published; would there be any real difficulty in having a rate book which should be accessible to the public, so that they might be satisfied that there was no undue favouritism shown to one person over another?—Yes, I do not see that there is much in that. They get to know each other's rates. At the same time it is not a usual thing in any kind of business that every man is to be informed about his neighbour's affairs.

14,093. Is the railway business the same as any other; has it not a monopoly of the district, as it were; Parliament gives you certain powers and says you shall not levy more than a certain sum, and therefore as Parliament has exercised that control, is there anything unreasonable in asking you to show to the public how you have exercised those powers?—I do not see anything directly objectionable in it, but the rates are published now to a certain extent; practically the quotation is a publication. If there was an alteration of a rate, and we applied it to every trader, we should send a circular out to every colliery. When we issued the notice about the 20,000 tons, there was a resolution passed to this effect, "Let notice be given to "every colliery owner of the change."

14,094. Still you say that a man may come and say, If you will give me a low rate I shall be able to send some coals to some particular works. That special rate I suppose you do not publish?—No; the fact is that a man sends away his 50 waggons or 200 tons of small coal, and there is an end of it, and perhaps there is not another person interested in the question.

14,095. (*Mr. Glyn.*) But another trader might be in the same position, and wished to do the same thing, but would not know that he might have the facility?—If he saw his neighbour sending away coals of such a quality, he would go and see whether he could not do the same thing, and would get similar terms.

14,096. (*Mr. Horsfall.*) You would put him on the same footing?—Directly, if we lay down a rule that is to be applicable to all.

14,097. (*Capt. Galton.*) If the rates were accessible, would not it give all the coal owners confidence that there was no preference given, and if that had been the case would it have been possible for Mr. Wooler to have had the impression that everybody was not treated alike?—Perhaps it might have disabused his mind to some extent, but I do not know how far it would work well altogether.

14,098. (*Chairman.*) Have you any important goods traffic on your line, exclusive of minerals?—Iron, a great deal of iron; pig iron, iron bars, and iron plates.

14,099. Is there much inequality in the rates on pig iron?—No, we apply the same uniformity there.

14,100. (*Mr. Horsfall.*) The same as to plates as to pig iron?—They are higher generally.

14,101. (*Chairman.*) Do you wish to add anything further to your evidence?—I think I have gone through all the points.

The witness withdrew.

Adjourned.

Thursday, 8th March 1866.

PRESENT:

THE RIGHT HON. THE EARL OF BELMORE.
THE RIGHT HON. LORD STANLEY, M.P., F.R.S.
THE HON. E. F. LEVESON GOWER, M.P.
SIR ROWLAND HILL, K.C.B., F.R.S.
T. B. HORSFALL, ESQ., M.P.
ROBERT DALGLISH, ESQ., M.P.
GEO. CARR GLYN, ESQ, M.P.
A. S. AYRTON, ESQ., M.P.
J. R. M'CLEAN, ESQ., PRES. INST. C.E.
WILLIAM POLE, F.R.S., *Secretary.*

HIS GRACE THE DUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

Mr. P. Morris.

8 Mar. 1866.

Mr. PERCY MORRIS examined.

14,102. (*Chairman.*) You are the general manager of the North Staffordshire Railway and Canal Company?—I am.

14,103. Have you a map of the system of the Company?—Yes. (*The witness produced the map, and explained the same.*)

14,104. What is the length of your line?—146½ miles are at present opened.

14,105. How much more is there in the course of construction?—There are about 40 miles more in the course of construction, under the Acts obtained during the last session.

14,106. How many miles of canal belong to you?—About 100.

14,107. Will you be kind enough to explain the peculiarities of the character of your line?—The North Staffordshire railway consists of numerous short branches, following the course of the valleys, and communicating with the trunk line. These short branches have invariably to be worked as separate systems, and it follows, as a matter of consequence, that in many cases traffic, which has to pass over a length of line of less than six miles, has to be worked by three separate systems, and, of course, at a very heavy cost. I do not know any railway in the country in which it is so difficult to work traffic as the North Staffordshire system, consequent upon the physical formation of the country.

14,108. (*Mr. Glyn.*) Do you mean on account of the bad gradients?—The gradients are not, on the whole, bad, but we have exceptional gradients in the mineral districts. Owing to the physical formation of the country, the North Staffordshire lines are necessarily in very short lengths. We never have a long lead for our traffic. We start with trains consisting perhaps of 30 or 40 waggons. Before we go a mile we drop 20 waggons, and then when we reach another mile we may pick 10 up, and in the course of two or three miles further on we drop the whole of them. We rarely get a long run for our traffic.

14,109. (*Chairman.*) Is it not the case that a large portion of your mineral traffic yields but a very small return?—The average gross rate received on the local mineral traffic is 1*s.* 6*d.* per ton only, including waggons, locomotive power, road toll, and terminal services. Upon the local through traffic—that is upon traffic which rises on the North Staffordshire system and goes beyond the North Staffordshire system—we earn 1*s.* 9*d.* That increase is attributable to our getting rather longer leads. I should state that nearly one moiety of the whole local mineral traffic conveyed over the North Staffordshire system yields only 1*s.* 6*d.*, and one-fifth of the whole local through traffic 1*s.* 9*d.* per ton only.

14,110. Your engines run a shorter distance than is the case on most lines?—I do not know any case that can compare with it. We have 11 engines in steam daily for an average of 13 hours, and these engines run about 24 miles per day only on the average. About six miles of our main line and 12 miles of our branch lines form a station yard the whole way.

14,111. Does that necessarily entail larger expense in your locomotive department?—It does; of course the greater number of miles per day you can get out of an engine the greater your profit.

14,112. Do you know what number of miles per day engines run on lines belonging to the larger companies on the average?—100 miles per day is considered a fair average.

14,113. And upon yours it is only 24 miles?—It is only 24 miles for a small portion of our engines, for 11 of our engines.

14,114. How many engines have you in work daily; do these 11 form a large proportion of the whole number that you have daily in work?—About 40 engines are daily in steam.

14,115. Then that is about one-fourth of the whole?—Yes; the remaining three-fourths of the engines do not make so good a mileage as the engines on the North-western, or the Midland, or any of the large systems of railway.

14,116. (*Mr. Glyn.*) What is the average cost of locomotive power per mile?—The average cost of locomotive power per mile run is something under 10*d.*, exclusive, of course, of any charge for the interest of money. The actual working expense for fuel, repairs, renewal, and wages is something under 10*d.* per mile run.

14,117. (*Chairman.*) You have had an opportunity of reading some complaints which have been made in their evidence before this Commission by Mr. Mathews and Mr. Hollins against your company?—I have.

14,118. I believe the nature of the complaints of Mr. Mathews is, that the rate charged over the North Staffordshire is much more than the rate charged for similar goods over other lines?—Mr. Mathews compares the charges made by the North Staffordshire company where they alone are interested and those where two or more companies are interested, and draws the conclusion that the rate per ton per mile charged by the North Staffordshire company is higher than that charged by other companies.

14,119. What observations do you wish to make with regard to Mr. Mathews' charges?—I wish to observe, that the rates which he has quoted are incorrect. In the first place, he states that the rate for iron of all descriptions between Wolverhampton and Stoke is 5*s.* 6*d.* per ton, the actual rate being 5*s.* I beg to hand in a list which contains the actual rates charged between Stoke and various important districts.

The witness delivered in the same, which is as follows:

14,120. I believe Mr. Mathews makes some complaint with reference to your charge from Middlesborough to North Staffordshire?—Mr. Mathews further states that the North Staffordshire company do not charge at the same rate per ton per mile from North Staffordshire as we charge from Middlesborough to North Staffordshire. The circumstances are simply these, that the rate which Mr. Mathews alludes to is one for pig-iron from Middlesborough into the North Staffordshire district, and it was a rate made at the special instigation of a very large number of the ironmasters of North Staffordshire, who complained that the makers of pig-iron of North Staffordshire charged such high rates for their pig-iron that it was impossible for the ironmasters who had to purchase pig-iron in the district to compete with other markets in the production of bar-iron. We thereupon made this very moderate rate, which has been in operation, very beneficially, in the district for some years. It is only a few days ago that I had a deputation of some ironmasters who urged a further reduction, in consequence of the excessive prices which the makers of pig-iron in the district were demanding for pig-iron.

14,121. Do I understand you to say that at the re-request of Mr. Mathews and other ironmasters you made a very low rate from Middlesborough into North Staffordshire, and that now they complain because you do not give the same low rates from North Staffordshire?—Yes; and Mr. Mathews says that because we carry pig iron from Middlesborough to North Staffordshire at one half-penny per ton per mile, that we ought to carry his iron to Liverpool or Manchester, or any portion of the route towards Middlesborough, at the same rate per ton per mile.

14,122. Are the charges higher from North Staffordshire to other towns in the north than from Middlesborough into North Staffordshire?—The rate from Middlesborough to North Staffordshire was an exceptionally low rate.

14,123. It would not answer your purpose to charge for all your traffic at that low rate?—No, certainly not. If that low rate were made uniform for all distances we should decline to carry traffic at that low rate. It would not be remunerative to carry for short distances at that rate.

14,124. (*Lord Stanley.*) Your argument is that as long as you charge within your Parliamentary rates, no one has a right to complain of your charging a lower rate upon one part of the line than upon another?—That is my argument.

14,125. (*Mr. Horsfall.*) What is the distance over which you charge the halfpenny per mile?—From Middlesborough the North Staffordshire distance would be 20 miles; that is the extent to which the North Staffordshire is interested in the rate. I see Mr. Mathews also states that the rate for bar iron from South Staffordshire to Stoke is 2*d.* per ton per mile. In fact, it averages only 1½*d.* per ton per mile inclusive of terminals, and 1*d.* per ton per mile exclusive of terminals.

14,126. (*Chairman.*) Can you explain how there is so much difference between his statement of the charge and yours?—The only way in which I can explain it is that he has fallen into error in his statements. I find that he has in many cases made an error either in his calculations or in the gross rate.

14,127. (*Mr. Horsfall.*) Does not his mistake probably arise from not knowing what your terminal charges are?—I think not. I think Mr. Mathews, who has had very great experience as a railway director, is perfectly aware of what terminals we do charge, and what we have a right to charge under the clearing-house system. I think his mistake has arisen in a great measure from a misconstruction of the toll clauses under which we are really entitled to charge.

14,128. (*Chairman.*) Do you always charge the same rates in both directions between any two places?—Invariably; the rate is made between certain stations, and not from one station to another station. For instance, a particular rate is charged between Stoke and Macclesfield, or Stoke and Birmingham, or Stoke and Derby, and it is the same in both directions.

14,129. For all descriptions of goods?—For all descriptions of goods.

14,130. Mr. Mathews also complains that the North Staffordshire Company's charges for short distances are excessive; what is your answer to that?—He does so in his evidence before the Commission, evidently following up his argument that because we carry for a halfpenny per ton per mile over a long distance we should carry for the same rate over a short distance. My answer is that the charges for short distances are invariably within our Parliamentary maximum, and that under those maximum charges the company is not

Mr. P. Morris.
8 Mar. 1866.

able to realize a reasonable profit, so expensive and costly is the service.

14,131. (*Mr. Horsfall.*) What dividend does your company pay ?—I find that we paid from the opening of the line an average dividend of 2*l.* 16*s.* per annum. We now pay about 4 per cent. For the last two years we have been able to pay a dividend of 4 per cent.

14,132. (*Earl of Belmore.*) Has your dividend been a progressive one ?—It has been very slowly progressing from 1847; at the present time it has only reached 4 per cent. Since 1847 we have spent a capital of something like five millions in the development of the district in railways alone.

14,133. (*Mr. Horsfall.*) Was not the last dividend rather over 4 per cent ?—For the last half year it was, but that was the best half year. The dividend for the previous half year was only at the rate of 3½ per cent. From July to December is generally the best half of the year. We generally get half per cent. more in the December half of the year than in the June half.

14,134. In case of difference between you and any parties who send goods by your railway, they have the power, have they not, of appealing to the Board of Trade to decide the question at issue between you ?—They have, under the 27 & 28 Vict. c. 308., 19th section, which provides that, "Besides the "rates per mile which the company are authorized to "charge for conveyance of goods or minerals on their "railways or canals they may charge for such terminal "services as are performed by them such reasonable "sum only as may be from time to time agreed upon "between the company and the person sending or "receiving goods, minerals, or other articles of traffic, "or failing agreement as may be settled by arbitration "under the Railway Companies' Arbitration Act, "1859."

14,135. Have you had many appeals under that power ?—We have not had a single appeal. That clause was put in our Bill of 1864. We had a Bill in Parliament for the construction of new lines, which was opposed by the ironmasters and potters of the district in order to get a reduction of our tolls. They complained to the Committee that there was no power by the existing law to compel the company to perform terminal services at a reasonable rate, and we at once agreed to this clause, which was duly framed by counsel from the instructions of Mr. Mathews and Mr. Hollins.

14,136. Then you see no objection to the insertion of a clause to the same effect in all railway bills ?—I see no objection to that at all. I was then the general manager of the company, and I at once agreed to the insertion of that clause because I thought it was a fair and reasonable clause.

14,137. (*Mr. Glyn.*) But at present it appears to be quite useless ?—It has never been used, for the reason, that our terminal charges have never been contested by any person as being unreasonable. They have never been questioned.

14,138. (*Mr. Horsfall.*) The charges are now arranged satisfactorily between you and all senders of goods ?—We have never made the slightest alteration in our rates since the passing of our Act, and we have never had any terminal charges disputed under this clause.

14,139. Then do you prefer the insertion of such a clause to fixing a maximum rate for those charges ?—I am not at all prepared to say that. I should not object to a maximum charge being fixed, provided it were one that would insure a reasonable profit to the company.

14,140. (*Chairman.*) Do you know whether that clause is peculiar to your Act, or has been adopted in their Acts by other railway companies ?—It is not within my knowledge that there is a similar clause in any other Act. I rather think that the words "rea-"sonable sum" are new in this clause. I know several cases in which railway Acts contain a power to companies to make a terminal charge when they perform certain duties, but I do not think the words "reasonable sum" will be found in such clauses.

14,141. (*Mr. Glyn.*) In recent Acts those words are inserted, are they not ?—Yes.

14,142. (*Mr. Horsfall.*) The difference between those Acts to which Mr. Glyn has just referred and yours is the insertion of a power to refer the dispute to arbitration under the Railway Clauses Act ?—That is the difference.

14,143. (*Chairman.*) Have you any remarks to make on the table which Mr. Mathews put in in answer to question 10,469 ?—The only remark I have to make on Mr. Mathews' table is that the rates shown include terminal services at both ends. He appears to work them out so as to include only the terminal charges at one end. The rates upon bar iron are higher than upon pig iron, because the carriage of bar iron is much more expensive than of pig iron. Pig iron is always conveyed in full truck loads, which generally average six tons; whereas bar iron is frequently conveyed in lots of two tons, requiring two waggons, the bar iron being so long as to require the use of protection waggons in its conveyance.

14,144. Mr. Mathews complains that you charge more than your Parliamentary tolls entitle you to charge for pig iron to Manchester ?—There again Mr. Mathews has fallen into error. The rate charged for pig iron to Manchester is 4*s.* 6*d.* per ton; 20 miles of the distance belong to the North Staffordshire, and 18 miles to the North-western. The actual rate charged if worked out upon the Parliamentary tolls of both companies would amount to 5*s.* 7½*d.* per ton, whereas we are only charging him 4*s.* 6*d.*

14,145. (*Mr. Ayrton.*) How many miles is that ?—It is 38 miles from Manchester to Hare Castle where Mr. Mathews' works are situate.

14,146. (*Earl of Belmore.*) In fact Mr. Mathews has mistaken what your Parliamentary tolls are ?—Entirely. He has taken the maximum toll, which does not apply to cases where the companies do not act as common carriers. The maximum tolls prescribed by the Act are tolls which the company are empowered to charge where they undertake the duty of common carriers; and where they do not perform those duties, the tolls for use of road, engine-power, and trucks are the tolls which the company are entitled to. Mr. Mathews must be perfectly aware of that fact from his very long experience, as I have already said, as a railway director, but he has evidently made a mistake.

14,147. (*Sir R. Hill.*) When you perform the duties of carriers the rates charged are not called "tolls," does not the mistake arise from using the term "tolls" in two different senses ?—That is Mr. Mathews' error. He should have said "rates" instead of "tolls."

14,148. Did you not use the word "tolls" yourself ?—I did use the word "tolls," no doubt, following Mr. Mathews' words. We charge tolls where we do not perform the duty of common carriers, and we charge the gross rate where we perform carriers duties.

14,149. "Rates" is the proper term to use where you undertake the duty of common carriers ?—It is.

14,150. (*Mr. Ayrton.*) Is it your construction of the Act that you can charge the sum of three rates in one case, and that you can only charge the maximum rate in another case ?—Clearly; the company is entitled to charge the sum of three tolls in cases where they do not perform the duty of common carriers, and there is a very obvious reason for that. Where they undertake the duties of common carriers they have special power to charge for terminal services, and then they can avail themselves of that power to make a greater profit, because in cases where they perform the duties of common carriers they find their own trucks, they can discharge them immediately upon their arrival, can load them in both directions and make a profit, which is impossible where they are simply toll takers.

14,151. Does not your Act provide that when you perform the duties of common carriers you can charge in addition to those duties over and above your maximum rates ?—It does.

14,152. Then what foundation have you for putting the construction on the Act, that when you perform the less duty you can charge a higher rate than if you performed the duties of common carriers?—Because where we perform the duties of common carriers, as I say, in addition to the charges which we are entitled to make for the service of loading and unloading, and carriers' services generally, we have a control over our stock; there is no detention of it; we can load it in both directions; but when we are toll takers only, we have no power whatever over our waggons; and instead of our waggons making three or four journeys a week, they will make only one. We cannot load them back again, and they return empty. It is therefore far more profitable for us to do our own work.

14,153. Can you inform the Commission under which section of your Act you claim to charge more than your maximum rates when you perform the duties of common carriers?—The 81st and 82nd sections of the 10 & 11 Victoria, c. 108.

14,154. (*Chairman.*) In answer to question 10,490, Mr. Mathews referred to a dispute which he had with the company as to the amount of a rate, and he stated that the matter was eventually compromised. Will you give your statement as to the facts of the case he there refers to?—The company charged Messrs. Kynnersly & Co. (Mr. Mathews being their manager) the ordinary rate for small consignments of traffic of 2*s.* 6*d.* per ton. Mr. Mathews drew the attention of the company to this charge, and asked for a reduction. Thereupon the charge was immediately reduced to 2*s.* That charge he still refused to pay, and indeed withheld payment of our accounts for this traffic for a period of nine months. The matter was eventually compromised by the company accepting 1*s.* 9*d.* per ton for past traffic; but they gave notice to him that for the future the charge would be 2*s.* per ton, and this charge has since been paid. The company's Parliamentary tolls, exclusive of any charge of terminal services, for this particular traffic amount to 1*s.* 11$\frac{3}{4}$*d.* per ton for the 10$\frac{3}{4}$ miles.

14,155. What was the nature of the traffic in this instance?—It was pig iron. It very frequently happens in the North Staffordshire district that we carry traffic by railway 7 or 8 miles which by road can be taken a distance of 2 or 3 miles; and the reason is, that the lines follow the course of the valleys, but the gradients are so bad on the roads over the hills that, in nearly every case, the traffic goes by rail. We frequently charge less than our maximum tolls because the distance is so short by road.

14,156. (*Lord Stanley.*) That would of course prevent your adopting any uniform mileage rate?—Quite so. I consider that the idea of carrying out a uniform rate is impracticable.

14,157. (*Chairman.*) Mr. Mathews stated that the railway company supplemented their railway rates by unreasonable terminal charges for short distances?—My reply is, that the charges made by the company for short distances are always within their Parliamentary maximum. Instead of charging lower terminals for short distances, the company ought really to charge a higher one, because the expense is the same in both cases to the company, and their profit on carriage for short distances is necessarily less than for long distances.

14,158. But the expenses of the termini are not greater?—They are the same in both cases.

14,159. (*Sir R. Hill.*) Are not the terminal charges invariable?—I think it would be quite impossible to make the terminal charges invariable, because the terminal services vary so much. In one case they consist simply of taking up a truck and depositing it, and in another case 20 or 30 trucks may have to be shunted before we can marshal a train. In one case we may have a single truck only for a certain station, and in another case, for instance, a train of coal for London will consist of 30 or 40 waggons for one consignee, which can be dealt with at once without trouble. In another case we may have 20 or 30 trucks for different places along the line, all of which must be marshalled into their proper order before the train can start.

14,160. My question had reference to varieties dependent upon the distance which the same goods are carried. I understood you to say that the terminal charge should be higher where the distance is short than where the distance is long. Why should there be that variety of charge on the same kind of goods?—Mr. Mathews' complaint is, that our terminal charges are the same for short as for long distances; but I say that if any alteration is made, our terminal charges should be higher for short distances than for long, because for short distances we realize a less profit.

14,161. But they do not vary?—They vary only according to the services performed.

14,162. (*Mr. Horsfall.*) In the statement of your evidence I find this, "Mr. Mathews appeared by counsel against the North Staffordshire Company's bills of 1864, and at his and Mr. Michael Hollins' instigation a clause was inserted, giving the freighters power to go to arbitration upon the amounts charged by the Company for terminal services." But they had power to do that under a previous Act, had they not?—They had not power to take us to the Board of Trade to arbitrate as to the reasonableness of terminal charges.

14,163. Have they not under the clause which you quoted before?—That is the very clause. That clause was inserted in our Act of 1864 at the instigation of Mr. Mathews and Mr. Hollins.

14,164. Was not that clause inserted in a previous Act?—I think not the same clause. It was the ordinary clause. Mr. Mathews and the gentlemen who supported him objected to that clause, and they wanted this clause inserted in our Act as a condition of the bill passing.

14,165. (*Mr. Glyn.*) They got the condition inserted of a reference to the Board of Trade?—Yes.

14,166. (*Mr. Horsfall.*) I think that was a previous Act of your company?—I am not aware of it; I think you are mistaken. I know this as a fact, that the opponents of the Bill made a great point of getting this clause inserted in the Act of 1864, and it was framed under the special instructions of Mr. Mathews and Mr. Hollins.

14,167. (*Chairman.*) Is the large proportion of Mr. Mathews' traffic carried very short distances?—I think the average distance which Mr. Mathews' traffic goes over our railway will not exceed 15 miles.

14,168. You have a short distance clause, have you not?—A six miles clause.

14,169. But that does not come into operation as far as he is concerned?—It does come into operation for a small portion of Mr. Mathews' traffic. A great portion of his traffic goes off our line. He is a producer, and his traffic goes to Manchester, Liverpool, London, and South Staffordshire. His traffic would pass over our line, upon the average, a distance of 16 miles. Mr. Matthews uses the canal which is in the heart of his works, that is, the Trent and Mersey canal, which belongs to the North Staffordshire Company. On the canal there are no terminal charges, as each freighter does his own work.

14,170. But I suppose your charges are such that he prefers carrying his traffic by rail rather than on the canal?—A large portion of Mr. Mathews' traffic does go by canal, but of course there are certain places which the canal will not serve at all. I am inclined to think that the result of the last two or three years has been to transfer the traffic from the canal to the railway, for of course the despatch and the convenience are greater upon the railway than they are upon the canal.

14,171. With regard to places which are served by both the canal and the railway, is the cost to Mr. Mathews the same by whichever route he chooses to send his traffic?—I should think certainly not; the canal would be cheaper.

14,172. But to many places he prefers the railway to the canal?—Yes; in fact his customers order the goods to be sent by railway, because they have been so accustomed to despatch that they will not order them to be sent by canal.

14,173. (*Mr. Ayrton.*) They give the preference to

Mr. P. Morris.
8 Mar. 1866.

the railway because the railway has communications which the canal has not?—That is so; the railway goes everywhere, and the canal only goes to certain places. He can reach Manchester, Liverpool, South Staffordshire, and London by canal, but there are certain places which the canal will not serve.

14,174. (*Earl of Belmore.*) Is it your opinion that railway companies have a right to obtain a profit out of their terminal charges, or only to charge so much as will recoup them the expense they are at?—My opinion is that a railway company has a right to make a reasonable profit out of their terminal services.

14,175. (*Chairman.*) In answer to question 10,497, Mr. Mathews refers to two descriptions of charges, the larger and the smaller; what are those different scales of charges to which he refers?—Mr. Mathews has evidently fallen into the error of quoting the maximum rates we are entitled to charge when acting as common carriers, instead of the tolls which we are entitled to charge when we do not act as common carriers.

14,176. You find waggons in all cases for all descriptions of traffic?—For every description of traffic. When I first joined the North Staffordshire Company I found that every ironmaster, or colliery owner, was finding his own waggons. We had probably as many as 60 different freighters on our line, each having their own waggons, and the delay to the traffic was so serious that I advised my directors to purchase the whole of the waggons, and undertake to send waggons for all mineral traffic at certain fixed charges. The freighters, with the exception of two or three insignificant ones, as regards the amount of their traffic, have all sold their waggons to us at a valuation.

14,177. Can you explain why your company has found it advisable to follow a different practice to that usually adopted by other railway companies?—In a great measure because the line was a peculiar one. We collect from so many different branches and sidings, which have to be worked by a separate system. We found that when waggons went out loaded to different places, they were marshalled in their order, and were so delivered to the North-western, and Midland, or the Great Western systems, but when they came back to our junction they were all mixed up, and before our train could start on its return journey, to re-deliver these empty waggons to the owners, the engine was engaged three or four hours marshalling the waggons. Now, when the waggons come back, and they are all North Staffordshire waggons, the engine takes them on at once, and drops as many as are required for each colliery, without the expense of marshalling for each siding according to the ownership of the waggon. They are left in sufficient numbers to suit the requirements of the colliery. We find that to be a very much cheaper system than the one which we adopted before.

14,178. How long is it since the change was adopted on your line?—A year.

14,179. Has it given satisfaction to the colliery owners?—Very general satisfaction, for this reason, that when the colliery owners found their own waggons they had to suffer all loss of delay in transit. Now the company is responsible for this delay. Formerly, if a waggon was delivered from one line to another within a reasonable time, say 24 hours, the owner could not complain, and the consequence was that his waggon did not return home for a week, 10 days, and sometimes a fortnight after its despatch. Now the company undertake all responsibility of detention in transit. We hold the coal worker or the mine worker responsible for any delay which occurs at his own siding, or at the siding of his customer, if it is beyond 24 hours; we allow 24 hours for the loading and discharging of the waggons; if they delay beyond that time we charge them demurrage. The North Staffordshire Company free them from all liability on account of delay in transit.

14,180. You have stated that there are peculiar circumstances in connexion with your line; you would not be prepared to lay down, as a general rule, that it is desirable for all companies to provide waggons for their mineral traffic?—I have no hesitation in saying that it would be desirable for all companies to find waggons for mineral traffic.

14,181. (*Mr. Ayrton.*) If you find waggons you have the advantage of being able to load them both ways?—Yes.

14,182. Has it never yet been arranged by any railway company that return trucks belonging to the freighters can be loaded?—The freighters never would agree to it.

14,183. So that in point of fact it necessarily involves a system of sending the waggons back empty?—Yes.

14,184. That would be a great waste of power, would it not?—An immense waste of power. I estimate that we are working our traffic now, since we find the waggons for the whole of it, at about 25 per cent. less waggon power than we formerly did.

14,185. Yours is in some respects a peculiar railway, being one having a larger proportion of weight of traffic as compared with your peculiar earnings than most other railways?—That is so. I am quite sure there is no other railway that earns so little as an average of 1*s.* 6*d.* per ton upon one moiety of its local mineral traffic.

14,186. Do you actually use a larger number of waggons as compared with the net profits that you make than most other companies?—Yes.

14,187. Therefore you have had your attention directed to this as one of economy?—Yes. I was some years traffic manager of the West Midland, and general manager of the Newport, Abergavenny, and Hereford. I found our engines employed in working mineral traffic were detained one-fifth of their time in marshalling waggons for the various collieries, and in drawing back empty the waggons.

14,188. There has never been any provision inserted in any Act so as to regulate the rights of the railway company or the rights of freighters with regard to sending back empty trucks?—No, I know of no provision of that kind in any railway Act.

14,189. It is generally supposed that the charge for forwarding full trucks embraces the charge for shunting back the empty trucks for nothing?—That is the general understanding. I think it is quite impossible that a freighter could agree that the company are to have the use of his waggons for return goods for any purpose whatever. He provides a certain number of waggons, which he considers to be sufficient for working his traffic upon an estimate that the waggons will make so many journeys each way in a given time. If the company on the return journey, say from South Staffordshire to North Staffordshire, were to have the power of detaining his waggons for their own use, he would not know when to expect them back again.

14,190. Is there any provision in any Act imposing an obligation to carry back railway trucks for nothing?—I know of no provision whatever.

14,191. (*Mr. Gower.*) You have mineral traffic both ways?—Yes, but the great bulk of our traffic is outwards. We are a producing district. With the exception of pig iron, which we receive from Middlesborough and other districts, coal from the Midland district, and coke from South Wales, I think nearly all our traffic in minerals and iron is outwards.

14,192. (*Mr. Glyn.*) All these waggons being the property of the company, I presume you are able to keep them in a better condition, and can depend upon their working regularly?—Yes; we are enabled to have a better class of waggon, which carries a heavier load.

14,193. (*Sir R. Hill.*) It is an arrangement which must also lead to economy in the use of sidings?—No doubt it effects economy in the use of our sidings as well.

14,194. I suppose a bargain of the description which you have mentioned is as advantageous to the previous owners of the waggons as it is advantageous to the company?—Clearly.

14,195. In point of fact, you and your customers divide the advantage?—Yes, no doubt we each get an advantage by it.

14,196. Nevertheless, the greater part of the mineral traffic of the country is still carried on in the owners'

waggons?—I think the only exception is that of the North-eastern Company, who have adopted our system of finding waggons for the whole of the mineral traffic.

14,197. (*Chairman.*) We will now go to questions from 10,498 to 10,504. Mr. Mathews appears to be of opinion that an uniform rate per mile would be the right principle to adopt; what is your opinion as to the question of uniform rates?—That it could not be carried out in practice, and that it would certainly deprive the public if it could be carried out of the competition which they now enjoy. As regards the North Staffordshire they would be entirely shut out from the supply of London coal which is carried at a rate including the waggons of something like $\frac{1}{2}d.$ per ton per mile. Mr. Mathews' objection to a low rate from Middlesborough is, I think, that we are carrying pig iron for the supply of other ironmasters in competition with pig iron made in North Staffordshire.

14,198. (*Mr. Ayrton.*) Does your railway from its construction or the mode in which it is laid out involve the necessity of travelling over a great deal more distance by rail than the direct distance from place to place?—That is so, necessarily; the short branches run through valleys which are nearly parallel with each other. We have to work down one valley for perhaps three miles, and then go back another three miles, whereas the direct road across the hill would be only two or three miles.

14,199. That arises entirely from the physical formation of the country?—Yes.

14,200. Therefore if you charged a mileage rate you would charge for all these distances up and down the line?—We do so now in cases where the maximum can be obtained. As I have said it very frequently happens that the distance across a valley is so short that we are obliged to charge an exceptionally low rate or give up the traffic altogether. Many circumstances arise which make it our interest to do so; for instance, it will happen that one particular district is an entirely producing district. We are obliged to send waggons to those works for their produce, and rather than send them empty we carry at a very low rate such raw materials as they require, and thus save haulage of empty waggons.

14,201. An uniform rate would be prohibitory of that?—Entirely.

14,202. (*Lord Stanley.*) Have you heard the suggestion made that the rate should be uniform, not for the distance it travels by rail, but for the distance from point to point as the crow flies?—I have never heard such a suggestion as that.

14,203. That is to say if two towns like Manchester and Liverpool, which are 30 miles apart and which have two or three ways of getting from one to the other, and one route is five or six miles longer than the other, you would not be allowed to make any extra charge for those five or six miles, but you would have to charge specially for the distance from point to point?—That would work in this way. Supposing the uniform rate from point to point was 1*d.* per ton per mile for 100 miles distance as the crow flies, and by another route it was 120 miles, a town which happened to be 110 miles would be charged a higher gross rate than the towns at the two terminal stations. That is the difficulty of having a fixed uniform mileage rate.

14,204. (*Sir R. Hill.*) If the distance between the towns was less as the crow flies, then the principle of charging by direct distance would not lead to a higher, but a lower charge?—Yes, if that were the case.

14,205. I understood you to say that in point of fact although you do not regulate your charges generally by direct distance you do approach that principle when your line is very tortuous?—Occasionally we do so.

14,206. The reason is to prevent the goods being carried by road?—Yes; but in all cases where we can, we charge for short distances our maximum toll.

14,207. (*Mr. Ayrton.*) As a rule I presume wherever there is competition the short distance regulates the rate?—No doubt the rate is based upon the shorter route.

14,208. (*Chairman.*) If you were obliged to charge an uniform rate universally would the consequence necessarily be that the traffic from Middlesborough into North Staffordshire would be put an end to?—We should give it up directly; we should decline to carry a ton.

14,209. Would that be an advantage to Mr. Mathews?—Certainly, I think it would.

14,210. Would it be an advantage to the district generally?—It would be very prejudicial generally, because the great bulk of the ironmasters are dependent for the supply of their pig iron either upon the North Staffordshire makers or upon independent sources like Middlesborough or South Wales.

14,211. (*Mr. Ayrton.*) Are you aware whether numerous railways have been made in this country which give a comparatively circuitous access to certain towns, and which have been supported by those towns because they could not afford to have what they might consider a shorter or more direct route, or because the configuration of the country did not admit of it?—I have known many cases in which a circuitous route has been adopted in consequence of the expensive character of the direct route.

14,212. Therefore, if the proposal were now to be made to make a route as the crow flies, would that be regarded as an act of great injustice to all persons who have paid their money upon the faith of the system which has been adopted?—No doubt, the rate which the company can afford to carry at must depend in some degree upon the capital which they have expended to make their railway. It has been frequently found that the longer and more circuitous route is the cheapest, in consequence of the direct route being so very expensive.

14,213. Are you aware whether there are not a great many cases in which people have been content to have branch lines, by means of which they connect themselves with main systems, which make the route to London, for example, very circuitous, but which they are content to adopt, because they cannot make a direct line to London themselves?—No doubt they would be very glad to get any communication with London rather than have none at all.

14,214. That is, with a small expenditure of capital in the first instance, in order to gain the benefit of a circuitous communication?—In order to gain the benefit of a communication with the main line at some other point.

14,215. If, therefore, a rate were charged according to the direct route from London or elsewhere, that would be, practically, subverting everything that has been done?—Unless you gave the company the power to charge a proportionate toll.

14,216. That is, a maximum toll which shall override the toll in all these cases?—Yes.

14,217. Then, if we did that, we should give power to companies who have made direct lines of charging higher rates than the circuitous lines?—Yes.

14,218. (*Sir R. Hill.*) If that power were given would there be any difficulty in making the rate of the company using the direct route equal to that of the other company?—No, I do not think it would be impossible to arrive at such an arrangement of the tolls.

14,219. But in the case supposed of a branch line being made which renders the distance by railway much greater than the distance as the crow flies, do companies, in point of fact, charge according to the full distance; do they not, in fact, make some reduction voluntarily in the charge in consequence of the circuitous route which is adopted?—I have no doubt they do in many cases; but, as a rule, I should say the rate is based upon the mileage.

14,220. Suppose the company that made the branch line had, instead of making the branch line, made a direct line, and consequently a shorter and more costly line; would it not be fair that they should charge upon that direct line a higher rate per mile than upon the circuitous line?—I think they would be entitled to charge a higher rate per mile upon the most expensive and shortest line.

Mr. P. Morris.
8 Mar. 1866.

14,221. Wherever a tortuous line is made it would be possible by very expensive engineering to make a direct line?—I believe engineers say that they can always make a direct line, and that it is a mere question of cost.

14,222. The tortuous line is adopted with a view to economy?—No doubt.

14,223. Then do you think that the company which incurs the expense of making the direct line, and consequently carries the passengers a less distance, is entitled to a less charge, simply because they carry the passengers a less distance?—No. I think, on the contrary, they are entitled to an increased charge.

14,224. If they incur a heavy expense for the purpose of making a direct line, does not that give them a moral claim at least to even a higher fare for the total distance?—Clearly. I think that a company making a very direct line at a very high cost is entitled to have higher tolls awarded to it than a company which makes a line at a very cheap cost. I think there are many cases, as for instance the case of the Lancashire and Yorkshire Company, whose lines are of a very expensive character, and who have come to Parliament in order to show that the tolls which they were empowered under their original Act to levy were unreasonably low, and Parliament has increased them.

14,225. (*Mr. Ayrton.*) There are, you think, numerous instances in which special tolls are authorized with regard to the peculiar circumstances under which the line has been constructed?—No doubt.

14,226. (*Sir R. Hill.*) In point of fact these are not practical questions, inasmuch as nearly all railway companies charge a rate lower than their maximum rate?—They nearly all charge lower than their maximum rate, and the rule is, I am quite sure, with railway companies to charge such a rate as they think to be fairly remunerative, and also such a rate as will develop the traffic. They are commercial undertakings, and if they put on an excessive rate it would not answer their purpose.

14,227. Might it not be put shortly thus, that the company charges that rate which it believes will afford the largest profit?—No doubt it is a pure question of net results; if they put on a prohibitory rate they get no traffic, whereas if they put on a reasonable rate they develop the traffic.

14,228. (*Chairman.*) With regard to your railway do you think you have arrived at a knowledge of what are remunerative rates. Are you pretty well satisfied that neither a higher rate nor a lower rate than you have adopted would pay you as well as the rates which you at present charge?—The rates which we are charging at present are the result of some years' experience. As regards our rates for short distances, although complained of by some freighters, such as Mr. Mathews, I am quite sure they are unremunerative or not so remunerative as we are fairly entitled to expect, but on the other hand if we were to increase them to any considerable extent we should damage the productive power of the district.

14,229. (*Sir R. Hill.*) On account of the competition of the ordinary roads?—Not so much on account of the competition of the ordinary roads as from the fact that it is a great producing district, and we must carry the raw material at a moderate rate.

14,230. (*Mr. Dalglish.*) In effect it would cease to be a producing district?—It would cease to be a producing district unless we carried the raw material at low rates.

14,231. (*Mr. Ayrton.*) Is there a growing scarcity in some of the mineral products of Staffordshire which renders it necessary to have regard to these considerations?—There is, particularly in coal and coke. Iron ore is still plentiful, but coal and coke are getting scarce and dear. There is no question that North Staffordshire is a very prosperous district. The ironmasters and potters, as a rule, are very prosperous; many who were workmen only a few years ago are now men of large fortunes.

14,232. (*Chairman.*) Do you invariably charge all parties equally between the same points and under like circumstances?—Invariably.

14,233. You give no advantages to large consumers over small?—We do make special rates for large quantities.

14,234. You do not consider those to be under like circumstances?—No; for instance, we carry coal in full train loads at a less rate than we should charge for a single truck.

14,235. Would you make the same allowance to all parties?—Under like circumstances.

14,236. Now, with respect to the alteration in rates, I think Mr. Mathews complains that sufficient notice is not given. What is your practice as to that?—Our practice is to give one month's notice of any alteration of rate. That is our regular rule. But I may add that, as a rule, alterations in rates have invariably been in favour of the public by way of a reduction of the rate. The manufacturers now are complaining of the great advance in the price of labour, and the consequence is that they are holding meetings to raise the price of their commodities, but the railway companies, whose powers of charge are restricted by Act of Parliament, cannot do so. We must carry at the same rate although everything we use in the conduct of our business is enhanced in price to a very considerable extent.

14,237. With respect to the publication of rates, do you see any objection to their being published?—None whatever, if it could be carried out.

14,238. But you think it cannot be carried out?—I am quite sure it would be impracticable.

14,239. What makes it impracticable?—Our rates are so numerous. We have upwards of half a million different rates, and last year the number of alterations of rates, either from new ones being adopted or old ones being altered, amounted to twenty thousand.

14,240. (*Mr. Ayrton.*) Do you find as a matter of practice persons engaged in business inform themselves of that which concerns their own business, and do not trouble themselves about that which concerns that which is not their own business?—That is the practice. If a man wants a rate he writes to the goods manager, and gets it by return of post, or he applies at the office, and gets it in five minutes. Practically each man is supplied with a list of rates affecting his own trade.

14,241. You do not find them making inquiries about the rates of other trades than their own?—No; but they very soon find out if a man in their own line of business has got a lower rate than themselves.

14,242. They devote their attention to the particular way in which the rate affects themselves?—Yes, and very properly.

14,243. On these points they always get information whenever they desire it?—That is so.

14,244. If the company were desirous of giving rates in favour of private individuals, I presume the publication of rates would not prevent their doing so?—No; it might be done by way of rebate, and the public would know nothing about it.

14,245. If you were determined to do it, there are commercial ways of doing it which would defy all publicity of rates?—No doubt, no publication of rates would protect the public against rebates, if the company wished to make them.

14,246. Is it your conviction that if any law were passed it could be evaded if the company were determined to do so?—As far as the North Staffordshire are concerned my belief is that we have not a single rate which gives any favour to one freighter over another.

14,247. (*Chairman.*) Mr. Mathews defines terminal services as "taking trucks into the sidings of the "freighter, and bringing them out again." Is that a sufficient definition in your opinion of terminal services?—Certainly not.

14,248. Will you explain what you understand by terminal services?—I consider terminal services to include all the duties which we perform for the freighter, such as the actual carriage, and the conveyance of the truck from A to B, and the expense which we have to

incur in the general management of our concern, such as rates and taxes, and outlay of capital for sidings and signal services, and all these items should be included in the cost of terminal service.

14,249. (*Mr. Ayrton.*) What rates and taxes?—Poor's rates, rates and assessed taxes.

14,250. Upon the whole line?—Upon the whole line.

14,251. (*Mr. Gower.*) Then the effect of that is that a person who only passes over a short portion of your line pays the same proportion as a person who goes over a longer portion of your line?—He should pay a fair proportion of it.

14,252. At present he pays as much as persons who go a long distance?—The terminal service at our stations amounts to so much per ton on the average, that average being made up of the various items I have mentioned. Whether a man's traffic is conveyed five miles or twenty miles over our railway, it makes no difference to us, the actual cost of terminal service being the same, irrespective of the distance the traffic is conveyed.

14,253. (*Mr. Ayrton.*) Is your Act framed in the way that Acts usually are, or in this language. With respect to the conveyance of horses, cattle, carriages, and goods a maximum rate of charge is made by the company, including the toll for the use of the railway waggons, and trucks, and locomotive power, and every expense incidental to such conveyance, except the loading and unloading of goods where such service is performed by the company, shall not exceed the rates prescribed?—I think that is the usual clause, and I have no doubt ours is the same.

14,254. How do you reconcile with that the mode in which you have estimated the terminal charges?—I think the items which I have named are included in the words. I think the clause is defective in that respect. The loading and unloading of goods forms a very small portion of our expenses.

14,255. But then the Act says you are to bear these when you charge your maximum rates?—Yes.

14,256. Therefore how can you put them on in addition in the shape of terminal charges?—It does no doubt appear to be an omission in the Act that we have no power to charge beyond our maximum charge, for loading and unloading.

14,257. You understand that loading and unloading would include all the expenses of the carriers in loading and unloading goods at your stations?—Yes.

14,258. That would include all those incidental expenses?—Yes.

14,259. If the carrier were to load and unload goods at your stations, you would be left to pay the rates and taxes, and find the tarpaulings, cords, and every incidental expense connected with the transit when you received the goods from him at one end and delivered them at the other, would you not?—I think if he used our line he would be bound to find his own accommodation in the way of sidings and the necessary conveniences. We should say we will carry your truck from A to B, and perform all the duties of common carriers as far as our railway goes, but when you get it to B you must find all the conveniences.

14,260. It does not say that you are to provide sidings and conveniences for loading and unloading?—I think that clause must be interpreted reasonably. A common carrier by road would find his own premises and do all this carrier's work, but because he carries by railway I do not think it is reasonable or fair that the railway company should be called upon to find all this accommodation without payment.

14,261. Has not Parliament by this clause imposed upon you the duty of receiving the goods, loading them into waggons, and unloading them, and therefore must you not bear all those intermediate expenses by your rates?—I think if that clause were interpreted literally it might bear that construction, but it would not be reasonable.

14,262. All you could charge would be any charge you might be put to if he undertook the service of loading and unloading the goods and took them away?—It would be so if that were really the correct interpretation, and that it could be carried out. Railway companies would decline to be common carriers, and compel the carriers to perform their own services. We should simply find road and engine power.

14,263. That, no doubt, would be a very inconvenient arrangement for the public?—I do not think the traffic of the country could be carried on in that way. Railway companies would decline to be common carriers if they were not allowed to charge for terminal expenses.

14,264. Do you know of any case where a railway company has endeavoured to superadd a terminal charge to its maximum rates for any other service, or do they protect themselves for what they are doing by making some other charge still equal to their maximum rates?—I think it will be found that all railway companies' rates for the conveyance of goods are according to class. There are five classes of goods in the clearing-house classification. For the first three classes railway companies generally carry within their Parliamentary maximum, but when you come to the fourth and fifth classes, which include furniture, glass, paintings, and all kinds of expensive articles, their maximum tolls added together would not amount to the gross rate which they charge; but the fact is that they are conveyed in such small quantities, as compared with the great bulk of the traffic, that the charge, though above their maximum, is still a very reasonable one. In the whole of my experience of 20 years as a railway manager I have never had a complaint of the charge made upon that class of goods.

14,265. They can protect themselves on that class of goods, of course, by demanding an *ad valorem* rate if they choose?—For the articles enumerated in the Act of course they could, but there are a number of articles not enumerated in the Act, which come within the 4th and 5th classes of the railway clearing-house classification; and unless a higher terminal charge is made on those articles they could not be carried by railway companies at the maximum rates or tolls prescribed by their Acts.

14,266. Making a limited estimate for terminal charge?—And a limited estimate for loading and unloading.

14,267. (*Earl of Belmore.*) I wish to ask you one question with regard to including rates and taxes in the terminal charges. In practice is it not the fact that terminals are only charged for goods traffic?—No; terminals are also charged upon mineral traffic.

14,268. I mean distinguishing mineral and goods traffic from passenger traffic?—Terminals are not charged upon passenger traffic.

14,269. If you charge rates and taxes over the whole of the line, and include them in your terminal charges, are you not charging the rates and taxes on the goods traffic alone, and not at all on the passenger traffic?—In estimating the cost of terminal services we debit the coaching department, which includes passengers, horses, and parcels conveyed by passenger trains, with its proportion *pro rata* of the rates and taxes. I had some time ago to get out an account of the actual cost of the terminal service over our system, and I dealt with it in this way. I debited the coaching department with its proportion of the rates and taxes, and the goods and mineral departments with their proportions, and I arrived at the average cost of the services performed.

14,270. In that case you do not charge the rates and taxes upon the entire of what is called terminal services?—Only their proportions.

14,271. (*Mr. Horsfall.*) Can you furnish the Commission with a copy of the table to which you refer?—I have it not with me, but I can state the result from memory. The actual cost of terminal charges upon goods averaged 2*s.* 3*d.* per ton over the whole of our system. I am referring to merchandise.

14,272. Perhaps you could furnish the Commission with a copy of the table to which you refer?—It was not got out in the form of a table. I extracted all these items from our account, and the substance of it was that it amounted to a certain sum,

Mr. P. Morris.
8 Mar. 1866.

which if divided over the total number of tons conveyed, averaged very nearly 2*s.* 3*d.* per ton.

14,273. What is your terminal charge upon coal?—It varies very much. Sometimes 6*d.*, sometimes 3*d.*, according to the quantities conveyed and the terminal services to be performed.

14,274. You have never charged more than 6*d.*?—No.

14,275. Is not your idea of terminal charges derived from the arrangements which are made at the clearing house as between one railway company and the others, which would be a totally different question as to the terminal charge which is made under the Act of Parliament to the public?—Clearly. Railway companies, as you are aware, agree that all the receipts earned by themselves shall be divided in certain proportions, that is to say, by the mileage after the deduction of the terminals. In the case of mineral traffic we divide with 9*d.* per ton at each end; station to station at 1*s.* 6*d.* per ton at each end; and carted traffic 4*s.* per ton at each end, with the exception of London.

14,276. That is based on a consideration of how the receipts ought to be divided with reference to the duties undertaken by the different railway companies who combine together for a through transit?—That is based, no doubt, upon what is believed to be the average cost to the companies of terminal services. Of course the intermediate companies are very careful not to allow the terminal companies to get what they consider an advantage over them.

14,277. The terminal companies, as against other companies co-operating with them for through rates, are entitled to take into consideration every expense incidental to such conveyance?—No doubt.

14,278. They are not entitled to take into consideration anything as against the public?—That is according to the strict interpretation of that clause.

14,279. Therefore the two things are really quite distinct?—No doubt.

14,280. Can you explain how the railway companies who have termini in London and Liverpool have arrived at a much larger terminal rate against your company, which they claim in the clearing house, than the railway rate?—They have shown that the cost of terminal services in London is so very much greater. First of all, station accommodation is more expensive; the cost of cartage greater, and the cost of labour is higher; and in consideration of this increased cost the companies out of London have agreed to allow in the division of traffic a higher terminal to the London companies. I think the terminal charge in London is 8*s.* 6*d.* per ton.

14,281. Is that an arrangement which has been acquiesced in by the provincial companies, or was it a rate which was forced upon them by the combination of the London companies at the earlier stage of railways?—I think it is a rate which has been acquiesced in by the provincial companies upon evidence which was sufficient to satisfy them of the actual cost of the service. I believe if the matter was gone into very closely that it would be found that it hardly covers the cost of the terminal charges of the metropolitan companies.

14,282. Having regard to the enormous tonnage and receipts of the termini in London as compared with the tonnage and receipts of the termini in other places?—Yes; my own opinion is that it is barely within the cost.

14,283. But considering the enormous amount of business done in Liverpool and London, and the general idea that where a great quantity of business is done it is done with more economy than where a small quantity of business is done, ought not the per-centage to be lower in London and Liverpool than anywhere else?—It would appear to be so at first sight, but I do not think, when it comes to be practically gone into, that it is so. The expenses in London are enormous. I have had some experience of it, because I was manager of the Great Northern and Great Western in their joint London business for some years, and I found the larger the business got the higher in proportion were our expenses. As the men got experienced they demanded higher wages, and we really found it to be policy to give them, because if we discharged them and took on younger hands the business was done so badly that it cost us more money. And the competition is so great. The public have been accustomed to be waited upon with such promptitude, that whereas in the old days the carrier would call at his convenience once a day upon the customer for his goods, now he has to be waited upon four or five times a day, and if his goods are not delivered with the same regularity as his letters, and with the utmost despatch, it is a matter of complaint against the company, and he will try another company, so that it is a competition of facilities as well as of rates.

14,284. Do you think the public have gained in facilities, although they have gained nothing in competition as regards the rates?—They have gained enormously in facilities. In our own district of the Potteries it has been so. We used to call upon the producers as it suited our convenience; but we now have to call upon them four, or five, or six times a day; and as fast as the manufacturer has packed a crate he has a team and cart waiting for it; so that it relieves him from the expense of finding warehouse-room. He used formerly to have to find warehouse-room for his goods, and to keep them on hand until he could complete his order. Now as fast as he packs his crate we take it from him and store it, thus saving him the expense of warehouse-room. It is really quite as much competition of facilities as of rates.

14,285. Do you think the question of the high terminal rates of London and Liverpool is not open to revision?—As the manager of a provincial company I should not be an advocate for the question being gone into. I should think it would result rather in an advance of the allowance than a diminution of it.

14,286. (*Mr. Dalglish.*) What is the largest town on your system?—You can hardly call it a town, it is called the Potteries, consisting of the towns of Longton, Stoke-upon-Trent, Hanley, Burslem, and Tunstall, all joined together.

14,287. (*Lord Stanley.*) It is a district which, in fact, is one continuous town?—It is one continuous town for six miles. They have their respective corporations or boards of health, but they are really one continuous town.

14,288. (*Mr. Dalglish.*) Supposing a colliery 10 miles from your terminus, and a certain number of tons of coal are sent to the terminus for delivery in the district by your railway, and another certain quantity of coal is sent to be delivered at some large works to be consumed there, which coal is taken out of the trucks by the proprietor's own men; what difference do you make in the terminal charge in those cases?—We have no case of the first kind which you allude to; we are not common carriers of coal. With respect to coal we merely convey the trucks from A. to B., and the owner or consignor in all cases loads or unloads. It is one peculiar feature in our railway that we have no local coal traffic in the most important part of our district, that is to say, coal for the supply of house purposes. The houses are so near the collieries that the coal is carted at a rate varying from 8*d.* to 1*s.* per ton, and it would not be worth our while to attempt to carry it. We should carry it at a loss if we did.

14,289. (*Mr. Horsfall.*) You stated just now that you had two terminal charges, one at 6*d.* and one at 3*d.*; under what circumstances do you charge 6*d.*?—It depends entirely upon the nature of the terminal services. In some places the freighter finds his own siding, and not only his own siding but a sufficient siding for marshalling his traffic for other places, and we have to find large accommodation for the marshalling of his trains beyond his own siding. If a man delivers his trade to us in full train loads to go long distances over our line, we charge him a low terminal. If he sends traffic very short distances, and in single trucks, we charge him a high one. In some cases a dozen shuntings are required before we can put the train into shape. In those cases we always charge a higher terminal than upon traffic in full train loads. Coal for manufacturing

purposes we charge at a very low rate. We bring coal from the Midland district to Lord Granville's works at five-eighths of a penny per ton per mile. We carry at the same rate for the potteries from the Leicestershire district. It would not pay us to carry at that rate for a short distance; but if we did not carry at that rate for a long distance the ironmasters and the potters would have very great difficulty in obtaining their fuel. It also enables the masters to keep their men in order. If they find they can get supplies out of their district they have less difficulty with their men than they would have if they were dependent on their own district.

14,290. Do you take much coal by canal?—We do not take very much by canal, except to the salt works. The collieries are laid out upon the high ground, and our canal runs through valleys. The collieries being upon the high ground are much better served by the railway than they are by the canal.

14,291. (*Chairman.*) We will now go to the complaints made by Mr. Hollins, but of course it would be unnecessary to go into those complaints of his which are merely a repetition of the complaints made by Mr. Mathews?—Mr. Hollins' evidence is very much a repetition of Mr. Mathews'.

14,292. We need only refer to those points which raise new matter. Mr. Hollins states that your company purchased the Trent and Mersey canal at nine times its original cost; is that the fact?—Mr. Hollins is in error there; the price paid for the canal was 1,170,000*l.*; that was the actual market price of the shares at that time. It was three times the original cost of the Trent and Mersey canal.

14,293. (*Lord Stanley.*) When you say the original cost of the Trent and Mersey canal, do you mean the original nominal capital, or the capital paid up?—The capital paid up. I wish to hand in a schedule of the Trent and Mersey Canal company's Acts of Parliament, under which the Trent and Mersey canal raised their capital, and which amounts to 420,000*l.*

The witness delivered in the same, which is as follows:

SCHEDULE of the late TRENT and MERSEY CANAL COMPANY'S ACTS of PARLIAMENT.

Dates.	Powers granted.	Money authorized.
		£
1766, 6 Geo. III., c. 96. - -	To make canal from Runcorn to Shardlow, and create 650 shares of 200*l.* each.	130,000
1770, 10 idem, c. 102. - -	Preamble, original capital insufficient, &c. Power to raise by new shares or mortgage.	70,000
1775, 15 idem, c. 20. - -	In order to complete works, and pay arrears of interest, further powers to raise.	70,000
1776, 16 idem, c. 32. - -	To make canal to Froghall, 17 miles, and railway from Froghall to Cauldron Limestone Quarries.	30,000
1783, 23 idem, c. 33. - -	Power to grant mortgages for payment of arrears of interest, 29,250*l.*, and to make the Stanley reservoir.	—
1796, 37 idem, c. 36. - -	To make Endon and Leek branch canals, and the Rudyard reservoir, &c.	10,000
1797, 37 idem, c. 81. - -	To make canals, Froghall to Uttoxeter, and branch to Burslem, &c.	—
1802, 42 idem, c. 25. - -	To make Lane End and Hanley tramways, &c., and first division of shares, viz. :—1,300 shares of 100*l.*	—
1809, 49 idem, c. 73. - -	To raise by mortgage to complete Uttoxeter canal, and to make the Dane feeder.	30,000
1823, 4 Geo. IV., c. 87. - -	To make new tunnel at Harecastle, and reservoir at Knypersley, &c.	60,000
1827, 7 and 8 idem, c. 81. -	To make one mile of Macclesfield canal, and 100 yards of Ellesmere and Chester canal at Middlewich; also for making a second division of shares, viz. :—2,600 shares of 50*l.*, and which were amalgamated with the railway by Acts of 26th June 1846, at 450*l.* per share, or capital of 1,170,000*l.*	20,000
1831, 1 William IV., c. 65. -	To consolidate and extend the powers of former Acts, &c.	—
12 Acts.		£420,000

1,170,000*l.* given for 420,000*l.* is as 139*l.* 5*s.* 6*d.* given for the 50*l.* share.

14,294. (*Chairman.*) Was that all paid up?—Yes; in addition to this 420,000*l.* the canal company have constructed works out of their revenue. They were very prosperous in those days, as may be imagined from the fact of the market price of the shares being 1,170,000*l.* Their revenue was a very large one, and they constructed large works out of their revenue, which cost them upwards of 200,000*l.*, so that the actual capital spent by the canal company in its construction amounted to 620,000*l.*

14,295. (*Mr. Horsfall.*) What was the date of the Act empowering the railway company to purchase the canal?—1847.

14,296. (*Mr. Ayrton.*) Have you earned 5 per cent. on the purchase price of the canal since you bought it?—Up to the last two years I think we have earned rather more than the 5 per cent guaranteed dividend upon the share capital, but the company have had to pay obligations to a very serious amount, which they never contemplated. Under the Trent and Mersey Act the owners of coal under the canal tunnels, and under the canal wherever it went, could compel the company to purchase all the mines underneath certain portions of their property whenever they became workable, and the consequence is that as the coal became workable, the company have had to buy all the mines under their canal tunnels, and other portions of their property, and this capital yields no return, because the company have no power to work the mines. As soon as a coal owner works up to us he can compel us to buy it at a valuation. We have paid 180,000*l.* for mines in addition to the original purchase money. We could work the coal to-morrow if we had power to do so, but we have no power to work coal, nor will any committee give us the power.

14,297. You could grant the coal owners the right of working at a royalty?—The coal owners decline that; they are quite satisfied with making us pay for the coal at present.

14,298. Having purchased it you could sell it to them again?—We have no power under our Act to do so. We endeavoured last year to get a clause inserted in our Branches Act enabling the company to sell to the proprietors these coal mines at a royalty, but there was so much opposition to it on the part of the mineral owners of the district, who feared they would have other mines brought into competition with theirs, that we withdrew the clause.

14,299. Have you not power to sell the surplus land

Mr. P. Morris.
8 Mar. 1866.

which is not required for the purposes of your undertaking?—There is a special clause in the Act prohibiting these mines being worked. They cannot be worked unless that portion of the Trent and Mersey Canal Act is repealed. We tried to repeal it last year, but the opposition was so great that we were obliged to withdraw the clause, and the consequence is that the capital sunk in this way yields no return. Although we have hitherto realized 5 per cent. upon the capital, the heavy liabilities under this mineral clause must reduce our dividend.

14,300. (*Chairman.*) Do you keep the canal accounts distinct from the railway accounts?—Entirely distinct; there is no connexion whatever between the railway and the canal accounts.

14,301. Mr. Hollins states that the policy of the North Staffordshire Company has been to force traffic as far as possible on the canal rather than on the railway. Have you any observations to make upon that statement?—That is his statement. He has on several occasions given that statement in evidence before committees of both Houses of Parliament when he has been opposing the North Staffordshire Company. I have to state in reply that it is an error on the part of Mr. Hollins. We have never attempted, nor do we attempt, to force traffic from one to the other; in fact, I always prefer the traffic going on the railway, because we get a better net profit out of traffic which is conveyed by railway than we do out of traffic conveyed by the canal.

14,302. Is there a part of your district in which it is more to the interest of your company to have the traffic conveyed on the canal rather than on the railway?—No; I think that impression is confined to Mr. Hollins's own mind, because our opponents have never been able to bring forward any other witness who would make that statement when they have been in opposition to our company in any committee.

14,303. Does not Mr. Hollins complain that the public are injured by this supposed disposition on the part of your company to force the traffic as far as possible on the canal?—Yes; I believe he states that in his evidence before the Commission; but he does not as far as I can find, bring forward any facts to corroborate his statement. He makes the same statement that Mr. Mathews did with regard to the company's power to charge for terminal services, altogether ignoring the fact that he has the power to go to arbitration under the clause which he himself procured the insertion of.

14,304. (*Lord Stanley.*) What was the original object of purchasing the canal?—I really cannot tell; that was a great many years ago, and before my time. I believe it was in order that the railway might take advantage, in certain portions of the country, of the bed of the canal. In some portions the canal has been shut up altogether, and the railway substituted. All I know is this fact, that the amalgamation of the railway and the canal was supported before Parliament by every trader in the district.

14,305. Then it was not to shut out competition?—I do not think so at all. It was with a view to serve the district by rail and canal.

14,306. (*Chairman.*) Was there ever at any time any competition between the canal and railway?—Never, because the canal became the property of the railway company before the railway was opened.

14,307. Was not the railway opened before 1847?—1847 or 1848 was the date of the opening of the railway. I am quite sure that the canal became the property of the railway before the railway was completed; in fact, it must have been so, for it was under the Act authorizing them to make their railway, which was in 1847. I may further state, as regards the canal, that the interest of the company is to keep down the charges on the canal, and not to put them up; and with that view they have themselves become carriers on the canal. We found that when we were simply toll-takers on the canal the carriers, instead of charging a reasonable rate for the carriage in addition to our toll, charged an excessive rate; and the consequence was that they really did force the traffic off the canal. Therefore the North Staffordshire became carriers. We have our own horses and boats on the canal as carriers, and we put the freights at such a reasonable rate as induced traffic on the canal. We felt that if we did not do so we should have the carriers resuming their heavy charges, and so force the traffic off the canal.

14,308. May that not be what Mr. Hollins refers to when he speaks of your forcing the traffic on the canal rather than on the railway?—I think he infers that the policy of the railway company is to charge such high rates on their railway as to force the traffic on the canal.

14,309. Since you became carriers on the canal have private carriers still kept on their business at their former high rates of charge?—No; they are obliged to carry at as low a rate as we do, or they would not get the business.

14,310. Mr. Hollins made some statement about the rate from Worcester to London, what observation have you to make with reference to that?—Mr. Hollins compares the rates of freight charged from North Staffordshire with the rates of freight charged from other manufacturing districts, and infers that our rates are excessive; he omits altogether the Worcester rate. I beg to hand in a table showing the rates charged for pottery-ware from Newcastle-on-Tyne, Knottingley, and Stoke, and also from Bristol, Worcester, and other places.

The witness delivered in the same, which is as follows:

TABLE showing RATES charged from various POTTERIES to LONDON, and the PER-CENTAGES borne by such RATES to the VALUE of COMMON EARTHENWARE, showing also the CONDITIONS of CARRIAGES.

Place.	Distance from London.	Rates charged.		
		Station to Station at Owner's Risk.	Collected and delivered in large Consignments.	Collected and Delivered in small Consignments at Carrier's risk.
	Mls.	£ s. d.	£ s. d.	£ s. d.
Newcastle-on-Tyne.	275	Full loads - 0 18 4	*At owner's risk.* 1 3 4 Collection - 0 2 6 1 5 10	1 11 0
Knottingley	170	In 4 ton lots 0 15 10 Under 4 tons 0 16 8	*Owner's risk* 1 0 0 Collection - 0 2 6 1 2 6	1 7 6
Stoke -	145	In 3 ton lots 1 0 0	10 tons for shipment, 25*s.* carrier's risk.	1 10 0

VALUE of 2½ Tons of COMMON EARTHENWARE as per Mr. HOLLINS' Statement, 18*l.* 12*s.* 8*d.*

Collected and delivered in crates—				£ s. d.
The carriage from Stoke at	30/0	per ton, would be		3 15 0
" " Newcastle at	31/0			3 17 6
" " Knottingley at	27/6			3 8 9
				£ s. d.
From value of goods (including crates) -				18 12 8
Deduct actual cost of crates, say 8 at 3*s.* each				1 4 0
				17 8 8
Station to station loose in trucks—				£ s. d.
The carriage from Stoke at	20/0	per ton, would be		2 10 0
" " Newcastle-on-Tyne at.	18/4			2 5 10
" " Knottingley at	15/10			1 19 7

PER-CENTAGES of RATES on VALUE of GOODS.

Places.	Per-centages.	
	In Crates.	Loose in trucks.
Stoke-upon-Trent - -	19 per cent.	15 per cent.
Newcastle-on-Tyne -	19 "	14 "
Knottingley - - -	18¾ "	12¼ "

Showing differences in favour of Yorkshire, Newcastle-on-Tyne, &c., &c., of only from $\frac{1}{4}$ to $2\frac{3}{4}$ per cent. on goods loose in trucks, as against the Staffordshire Potteries, although those districts have the advantages of competition by sea.

Other rates for pottery ware compared where the services rendered by all the carriers are the same, and there are two or more companies carrying between the same places :—

	Miles.	£	s.	d.
Bristol to London -	- 118 -	- 1	7	6
Coleport „ -	- 156 -	- 1	16	8
Worcester „ -	- 119 -	- 1	8	4
Stoke „ -	- 145 -	- 1	10	0

14,311. (*Mr. Horsfall.*) How does that agree with the table of rates which was put in by Mr. Hollins ?—They are precisely the same. Mr. Hollins has selected a few which suit his argument, leaving out others which tell against him. I have supplied in my table the rates for all districts of which he complains. I may add with regard to the rates for the earthenware that in nearly every case three or four collections and deliveries have to be made for each ton weight. The rate is per ton, but the crates vary from four, five, six, to seven hundredweight each. The great bulk of them have to be collected from different places, and delivered separately. The shipping trade, which is the largest, goes in 10 ton lots, and the great bulk of that is transmitted by canal to Liverpool.

14,312. (*Chairman.*) Do you wish to make any statement with regard to Messrs. Minton's traffic ?—In question 11,275, Mr. Hollins gives a list of rates, of which he complains. I find that the only instances which he is able to produce against the company are six in number, the total weight of which is 3 tons, 7 cwt., 3 qrs., 4 lbs., the total charge for which was 1*l.* 18*s.* 10*d.* That is spread over one year. I can hand in the particulars.

The witness handed in the same, which is as follows :

The Patent Tile Company's Goods from Stoke to all North Staffordshire Stations for One Year, ending 30th April, 1864 :—

	Tons.	cwts.	qrs.	lbs.	£	s.	d.
To Burton - . -	0	15	0	24	0	11	8
„ Crewe - -	0	1	0	0	0	0	9
„ Congleton - -	0	6	2	24	0	4	4
„ Macclesfield - -	0	13	3	6	0	8	1
„ Uttoxeter - -	1	3	2	26	0	11	2
„ Harecastle - -	0	7	0	8	0	2	10
	3	7	2	4	1	18	10

14,313. What do you suppose the whole of Messrs. Minton's traffic would be for a year ?—A great many thousand tons. They are quite the leading firm in the Potteries, and do an enormous business. Mr. Hollins has really had to search the whole of their books for 12 months to find six cases of what he considers to be complaint against us, in neither of which, I think, is there any fair ground for complaint.

14,314. Are not these selected merely as instances in which they have had to complain of you rather than as the sole cases in which they have any ground of complaint ?—I am quite sure that Mr. Hollins, if he could have found any more, would have brought them forward. He brings forward every point that he can against the North Staffordshire Company in order to make out a case for a reduction of our tolls, but when he has been pressed before committees he has never been able to add to this list, which he has already produced before several committees.

14,315. (*Mr. Horsfall.*) Why should he complain if these are the only instances which he can produce ?—I have always been at a loss to understand why he should complain. No doubt it is the interest of the traders of the district to get the goods conveyed at as low a rate as possible ; but I think they should be reasonable. The North Staffordshire Company have done their utmost to develop the trade of that district by expending a large capital. Their charges are, I consider, most moderate. Last year, when they were in Parliament, they agreed to effect a certain reduction in their tolls. One moiety of this reduction came in force on the 1st January 1865. The second moiety comes into operation on the 1st of January 1868. We showed the committee that, although our dividends had averaged only 2*l.* 16*s.* per cent. per annum, we were still willing, with a view of developing the trade of the district, to submit to a further reduction of tolls, and upon that undertaking on the part of the company the Bill was passed, and clauses enacting these reductions inserted.

Mr. P. Morri

8 Mar. 1866.

14,316. (*Chairman.*) Has Mr. Hollins frequently been in the habit of making applications to your company for a reduction of your charges ?—No, his complaints have been confined to giving evidence before committees of both Houses of Parliament. We have carried on his trade, I believe, to the satisfaction of the firm with which he is connected for a great many years.

14,317. (*Mr. Horsfall.*) Do you mean to say that he has never applied to the company for any reduction of rates ?—I have never seen a letter from him applying for a reduction of rates. His complaints have been confined, as far as I know, to giving evidence before committees of both Houses of Parliament, and to statements made to the Chamber of Commerce of which he is the chairman. He thinks it right to complain of the North Staffordshire Company's rates, but does not say how, practically, he proposes to deal with them. He only says that he wishes them reduced. I have only been connected with the North Staffordshire for a period of two and a half years, and I can positively assert that I have never had a single complaint from Mr. Hollins as to our rates, or as to the mode in which his business was conducted. He admits in fact in his evidence before the Committee, that the company have conducted his traffic so well that he never has had a claim for damages against them. We have a very expensive article to deal with. The crates, when filled with this expensive ware, are frequently worth 100*l.* each, and we have to handle them very carefully, and it is a rare thing to get a complaint of breakage from manufacturers.

14,318. (*Chairman.*) In his answer to question 11,287, Mr. Hollins states that your charges would be the same from station to station, where you are at no expense of collection and delivery ?—He is in error there. The charges from station to station are exclusive of cartage, and wherever a rate is required in which no cartage service is involved we make a deduction, and and in cases where the rate includes cartage, and no cartage is performed, the consignee or consignor, as the case may be, demands an allowance for the cartage, and we make it.

14,319. Can you explain how Mr. Hollins should be ignorant of such a charge ?—I really cannot. He has fallen into so many errors that they astonish me. He hasfrequently been put right before committees of both Houses, but he still maintains his statements. At the close of his evidence he gave in the state of things which existed with regard to the tolls in 1862. In giving evidence in 1866 he hands in a table of tolls which existed in 1862, and at the bottom he says,—"N.B.—"The above table is based on the rates charged previous "to the reduction made in November 1862." He might just as well have quoted a table of tolls charged in 1797, which would have been just as applicable.

14,320. Of course there has been a considerable alteration made since 1862 ?—Yes. As an appendix to my evidence, I beg to hand in an entire list of the original tolls and the reductions which have since been made.

Mr. P. Morris.

8 Mar. 1866.

The witness delivered in the same, which is as follows:

NORTH STAFFORDSHIRE RAILWAY.

Navigation from the Trent to the Mersey.

TOLLS.

Under the first Canal Act, 19th May 1761, and until the passing of the Pottery Railway Act, 1846–47, the maximum toll for every description of goods was $1\frac{1}{2}d$; per ton per mile, except upon lime and limestone, and road materials, and traffic passing along the Pottery and the Cauldon tramways, which varied from $\frac{1}{2}d$. to 3*d*. per ton per mile.

The latter Act established the following Maximum Tolls, with which are compared the Reduced Tolls charged 1st March 1866.

—	Maximum Rates, 1847, per Ton per Mile.	Reductions since 1847.	Reduced Rates to March 1st 1866, per Ton per Mile.
	d.		*d.*
		Between Horninglow or Shobnall, and Preston Brook or Anderton	$\frac{2}{8}$
Earthenware	$1\frac{1}{2}$	„ Potteries and Fradley	1

Cement and plaster from Alrewas Moor	—	$8\frac{1}{2}$

N.B.—The gross toll upon all goods passing off or on at Hall Green or Wardle Lock is not to exceed the gross toll on the like goods passing over the same ground to or from Preston Brook.

14,321. (*Mr. Ayrton.*) Making an allowance to the freighters who receive or deliver the goods themselves by a cart as within the limits of your own undertaking, do you make an exact calculation of the cost to them of the alteration?—No; it is an uniform allowance; we allow 1*s.* 6*d.* per ton at country stations, and 1*s.* 8*d.* in the Potteries to potters who perform their own cartage. I do not know a single case in the Potteries where any manufacturer carts his own goods; he finds that our charge is lower than he can do it for himself.

14,322. Is the allowance made to him not equal to the cost he would be put to if he did it himself?—It would not be worth his while to keep a cartage staff to do his own work, because he would not have enough to do to keep them employed.

14,323. The economy which you are able to effect only results from superior organization?—No doubt we do it at a cost per ton which he could not approach.

14,324. In cases where you deliver goods into trucks on the sidings what allowance do you make?—We make no allowance for that at all, because the rate is always given for the particular service. The rate from siding to siding is a much lower rate than the rate from the siding to the station where we have to provide wharfage. Where it is from siding to station the goods are generally for manufacturing purposes.

14,325. Have you any rule for your own guidance by which you make a rebate as compared with the greater charge to the station?—Our rule is with regard to stations where there is no competition, for instance, coal for household purposes; we charge, in addition to our mileage rate, which is about 1*d.* per ton per mile, a 6*d.* terminal for wharfage and station accommodation.

14,326. When you are delivering into a siding, you then not only rebate the 6*d.* but you charge a less mileage rate?—We do charge a lower terminal, except in cases of short distances. For short distances we invariably charge our maximum toll where it can be obtained.

14,327. Do you add a terminal charge?—Where we put it into a siding we charge a terminal as well.

14,328. In addition to your maximum toll?—Yes.

14,329. Have you any rule by which that additional charge is regulated?—It is generally regulated by what the traffic will really bear. The circumstances of one case are different from another. In some cases we find that the traffic can be conveyed at the maximum toll without terminal. In some cases we do so, but in others, where the terminal services are expensive, we charge 3*d.*, 4*d.*, or 6*d.* per ton, as the case may be.

14,330. For putting it into the siding?—At both ends.

14,331. Is that the case where you go on a siding for some distance?—The freighters look upon the act of putting the trucks into a siding as if it were a simple operation. They are really branches to the collieries.

14,332. I want you to separate that case. I am asking you simply with reference to putting trucks into sidings?—We have in addition to putting the trucks into the sidings to provide siding accommodation on our own property for the marshalling of their trains. They merely provide accommodation inside their own fences, and unless we were to afford very large siding accommodation in addition to that we could not work their traffic at all. We have to find accommodation for the marshalling and shunting the trains in addition to what they find on their own land.

14,333. You claim the right to charge something in addition to what you charge for the siding?—Yes. I could mention some cases where we have spent between 5,000*l.* and 6,000*l.* for nothing but marshalling the traffic on private sidings. It was only the other day I had to get an order from the Board to increase the siding accommodation for this very purpose on some points of our line, and I do not think we shall do it under 10,000*l.*

14,334. Where your siding extends an additional length in order to join a branch colliery you make an additional charge for that?—That is a matter of agreement with the owner. He comes to us and says:—"Now, instead of my working this branch suppose I "allow you to work it, what would be your charge "per ton." We then quote him a rate, and it is cheaper for him to allow us to work it than for him to work it himself.

14,335. You consider you are not under any legal obligation to carry off your own line?—No.

14,336. And that, therefore, you are at liberty to get as much as you can for it?—Yes; it must be a reasonable charge or the owners will provide the power themselves. I can give you a case in point. On the Talk of the Hill branch, a very important district, the owners used to find their own engines. They asked us what rate we would charge them for the working of this

branch. I quoted them a rate which I was quite satisfied would be less than their actual cost; they accepted it.

14,337. Do you think that that always depends so much upon special circumstances that it would be impossible to lay down any uniform rule?—I am quite sure that, if a uniform terminal were laid down, in justice to the companies you would have to fix it at such a maximum as would operate prejudically in some cases. We might have power to charge 6*d.* in some cases where we could well afford to do it for 2*d.* if we were able to make a variation in the terminal charges.

14,338. Or there would have to be a classification of charges, and not one uniform rate?—Yes, but a classification of charges would be very difficult, because the circumstances vary in almost every case.

14,339. (*Chairman.*) Do you wish to put in a statement showing the reduction of freight made upon the Trent and Mersey canal?—Mr. Hollins in his evidence refers to the Liverpool rates. He says, in answer to question 11,320, "I may state with regard "to Staffordshire, which before the Grand Junction "railway, which is now the London and North-western, "was finished and opened the charge for earthenware "to London per ton was three guineas, now it is "30*s.* In consequence of the competition between "the canals and the railway it was reduced to 35*s.*, "and it has lately been reduced to 30*s.* But on the "other hand to Liverpool the rate remains very nearly "the same. I do not know that there has any re"duction taken place at all, although we have both "railway and canal communication too there." In reply to that I state that the tolls on the Trent and Mersey canal were reduced in January 1865 as follows:—Earthenware from 1½*d.* to 1¼*d.* per ton per mile. Potters' materials from 1*d.* to ¾*d.* per ton per mile. Pig iron from 1*d.* to ¾*d* per ton per mile. Calcined ore from ¾*d.* to ⅝*d.* per ton per mile. And the freight between the Potteries and Liverpool, on earthenware, from 13*s.* 6*d.* to 12*s.* per ton. On potters' materials, from 7*s.* 4*d.* to 6*s.* 9*d.* per ton. I will now hand in a table which shows the reduction of freight over a period of 33 years.

The witness delivered in the same, which is as follows:

RATES of FREIGHT for EARTHENWARE and POTTERS' RAW MATERIALS at VARIOUS PERIODS.

Earthenware from the Potteries.	Rates previous to April 30, 1832.		Rates from April 1832 to December 25, 1837.		Rates from December 1837 to April 1854.		Rates from April 1854 to December 31, 1864.		Rates from January 1, 1865, now charged.

	On 2,400 lbs. to the ton.					2,240 lbs. to the ton.		

Mr. Hollins says that he is not aware of any reduction of fares, but by the table which I have handed in, it will be seen that the reduction is very great.

14,340. With reference to the statement that traffic is forced on the canal in preference to the railway, he states that you can carry traffic for 30 miles over the canal and only 15 miles over the railway, and for that reason he thinks you find it for your interest to force traffic rather on the canal than on the railway?—Mr. Hollins states, and there is no doubt of the fact, that if the traffic goes by canal it passes over 30 miles to Preston Brook, and we get more out of the shorter distance by railway to Liverpool over our line than we do out of the toll on our canal to Preston Brook. We get a greater net revenue out of the railway for all the earthenware we carry between Liverpool and the Potteries than we do out of the canal between the same places. It has been my object as far as possible to develop the railway traffic rather than the canal.

14,341. I believe you have prepared a statement of the traffic for some years previous to the opening of the railways, and for some years after the opening of the railway?—Yes. I think that statement is a perfect answer to Mr. Hollins' complaints. It shows before the railway was opened the weight carried on the canal, and the receipts from the tolls from the year 1840 to the year 1849, and it also shows from the year 1850 to the year 1863 the weight carried on the canal and the receipts from the tolls, and the weight carried on the railway. It shows in fact that in spite of the amalgamation of the canal and the railway, of which Mr. Hollins complains, that the weights carried by the canal have increased to a very small extent, whereas the weights on the railway have increased enormously. They have increased from 272,893 in the year 1850, to 1,423,204 tons in the year 1863. I hope the Commission will allow that table to be inserted in my evidence, because I think it is a most conclusive answer to Mr. Hollins' remarks.

The witness delivered in the same, which is as follows:

Questions 11,321 *to* 11,327.

The following table proves that instead of forcing the traffic on the canal as alleged by Mr. Hollins, the weights carried by railway are constantly increasing.

STATEMENT OF TRAFFIC.

BEFORE the Opening of the North Staffordshire Railway.

Year.		Weight carried on Canal.	Receipt from Tolls.
		Tons.	£

14,342. Mr. Hollins' evidence refers to various attempts that have been made to introduce competing lines into the North Staffordshire district, do you agree as to his explanation of the causes of the defeat of those schemes?—I entirely disagree with his explanation. He attributes the defeat to the opposition of the landowners; whereas the fact really is that the committee were satisfied with the evidence we produced as to what we had done in the district by way of developing the traffic of the district, and the very moderate charges which the company had made. Mr. Hollins also complained that we created a monopoly, whereas we proved to the satisfaction of the committee that we had introduced a very active competition by means of the running powers granted to the North-western over the whole of our system, and which they are now exercising. They have the right to carry over our whole system at any through rates they like.

14,343. Have they, in return for the running powers which you have granted them over your system, conceded to you running powers over their system?—We have running powers over a certain portion of their system in return for the running powers which they have over ours. We have running powers between Crewe and Liverpool, between Macclesfield and Manchester, between Norton Bridge and Birmingham, including South Staffordshire.

14,344. Do you mutually make much use of these running powers?—The North Staffordshire are exercising their running powers over the whole of the North-western system over which they have the right to exercise them. The North-western are exercising their running powers to the pottery district and between Macclesfield and Colwich. From Manchester to London, the shortest route is by the North Staffordshire line, and they exercise their running powers over our line for a large portion of their goods traffic. The passenger traffic they are obliged to send *viâ* Crewe, as a matter of economy. They do not exercise the whole of their running powers through the purely agricultural district through which our line runs, but through the Potteries and the mineral district, where there is traffic to be got, they do exercise their powers, and the public have the opportunity of availing themselves of the service of the North-western or the North Staffordshire as they like.

14,345. (*Lord Stanley.*) Does it not come to this, that you and the North-western practically work one system?—Only at certain places. In order to develop the traffic of North and South Staffordshire it is necessary that one company should work the traffic throughout, and we do it. It was found that the people in South Staffordshire could not depend upon despatch when their traffic was worked separately by the two companies. The service is done in one-fourth the time by North Staffordshire working throughout.

14,346. (*Mr. Gower.*) When were these running powers first established?—In 1851.

14,347. (*Mr. Horsfall.*) Does not the North-western work the South Staffordshire?—I believe it is leased permanently to the North-western. I am not quite certain of that fact, but I know they work it. The North-western and the North Staffordshire applied to Parliament in three successive years for power to amalgamate, both companies having arranged terms, but the opposition in the district was so great to the amalgamation of the Trent and Mersey canal and the North-western, that the Bill was thrown out on each occasion. It was, of course, thought that the North-western, already possessing the Shropshire Union canal, would have a monopoly of the carrying trade of the district.

14,348. (*Chairman.*) Will you now refer to question 11,387 of Mr. Hollins's evidence?—In answer to question 11,387, Mr. Hollins states that he could not state whether the Committee who rejected the Bill in the House of Lords was aware of the agreement which existed between Mr. Sneyd and the North Staffordshire Railway Company. My reply is, that the counsel acting for Mr. Hollins called upon the company to produce the agreement itself; our counsel did produce and read it to the committee, who were perfectly aware of the facts of the agreement.

14,349. The drift of Mr. Hollins' evidence went to show that the policy pursued by the North Staffordshire Railway Company had been to retard the development of the pottery district. You have already said that in your opinion your district has advanced more rapidly than any district which any other line accommodates?—I know of no district that has become so rapidly prosperous as North Staffordshire. The table which I have already handed in shows the increase of the weights carried on our system of railways and canals. That alone is a sufficient reply to Mr. Hollins' statement; it shows an immense increase in the trade of the district.

14,350. Is there a considerable portion of that traffic for Crewe carried through for places beyond?—No, it is entirely North Staffordshire traffic. Unfortunately, our system is not a through traffic system.

14,351. Did you not refer to a great deal of Manchester traffic being carried by the North-western railway over your line?—That is so. This return only shows the traffic carried by our railway to and from the pottery district. I also wish to draw attention to the fact that the census proves a greater increase in the population employed in the North Staffordshire potteries as compared with the increase in other potteries which Mr. Hollins states are competing with him. In the year 1851 the total number of persons engaged in the northern potteries (including the West Riding, East Riding, with York, North Riding, Durham, Northumberland, and Westmoreland) was 3,861, and in the year 1861, 4006, being an increase of less than five per cent.; whereas in Staffordshire the number of persons employed in the year 1851 was 25,022, and in 1861 27,432, showing an increase in the population employed exclusively in the pottery trade of nearly 10 per cent. That does not look like a decrease in the prosperity of the district.

14,352. A considerable part of your district is very populous?—But very small in extent.

14,353. Do you charge the same passenger fares over that populous district as you do over the rest of your line?—No; what is called the potteries district is served by an omnibus service, the trains running every 15 or 20 minutes. We charge low fares by that omnibus service to induce the working population to travel.

14,354. Do you charge low fares for all classes of passengers over that portion of the line?—For all classes of passengers the fares are low.

14,355. What are the fares per mile?—The fares are not calculated per mile. Take the town of Stoke and the town of Longton, the distance is about two miles; we charge 2*d.* for third-class passengers, 3*d.* for second-class passengers, and 4*d.* for first-class passengers. In fact, we charge an omnibus fare which we think will induce people to travel.

14,356. Have those been in operation for many years?—No, the fares have only been in operation since the opening of the Hanley line. Until the Hanley branch opened we had no omnibus service, and as soon as that opened we ran an omnibus service between the pottery towns.

14,357. Do you know whether low fares have ever been tried as an experiment in the merely agricultural portions of your district?—We have uniform fares over the agricultural portions of our district of 1*d.* per ton per mile third class, 1½*d.* second class, and 2*d.* first class. We carry passengers in the summer by excursion trains at very low fares from the agricultural district to Manchester, charging something like 2*s.* 6*d.* there and back. In that way we carry a large number of people every year.

14,358. (*Mr. Ayrton.*) Do you find that the passengers by the cheap trains use them for pleasure traffic or business traffic?—Principally pleasure traffic. No doubt a great many business people take advantage of these cheap excursion trains instead of going by the ordinary trains. The omnibus traffic is confined to the short services.

14,359. I was referring to the omnibus traffic, is that for carrying people to their daily work?—Yes; numbers of workpeople avail themselves of it. They travel from Hanley to Longton, a distance of four miles, in train loads to and from their work. House accommodation is very difficult to find in the potteries. They will go to and from their work if they can go at low fares. If higher fares were charged they unquestionably would not travel by the line.

14,360. Do they follow that practice because they think it desirable to get out of the bad air and the smoke of the potteries?—No; I do not think the air of the potteries is unwholesome, on the contrary, it is considered to be healthy, but house accommodation is so difficult to get that they find it cheaper to go out a mile or two.

14,361. Is the increase of the pottery trade in china or in fine pottery or in coarse ware?—No doubt the bulk would be earthenware, but both have advanced very rapidly; the business of china manufacturers, such as Minton and Co., Alderman Copeland, and the Hill Pottery Company in fine china has advanced very rapidly.

14,362. But the weight of that is not very great?—The bulk is earthenware, no doubt, and although it is expensive earthenware, it does not come under the category of china.

14,363. (*Chairman.*) Do you find that the working classes go home to their meals by these omnibus trains?—No; they take their food with them.

14,364. Then you suppose that the traffic would only be morning and evening?—That is so with extreme towns; but where the distance between the towns is very short, they may go home to their meals.

14,365. They use the railway for that purpose?—Yes; they go home to their meals, travelling for one fare and a half there and back.

14,366. Do you seat them in these trucks?—Yes; they are precisely the same class of carriages that we use for our general traffic. In fact, they are rather better carriages, because we have had new carriages built for it. The second-class contains seats covered with leather cushions, and the third-class are all fitted with seats and covered in.

14,367. (*Earl of Belmore.*) Do you mean that you charge a penny for each journey or the day?—The fare is for each journey.

14,368. You do not give return tickets?—Not to the third-class.

14,369. (*Chairman.*) Have you formed any opinion as to what would be the effect of a general reduction of fares on your system?—My opinion has always been that the fares for the third-class passengers, that is, for the working population, should be reduced. I am quite sure that it would answer the company's purpose to do so, and more for long distances than for short.

14,370. To what extent do you think it advisable to reduce the fares for third-class passengers?—I have not gone sufficiently into detail to say to what extent I should recommend its being done, but the principle I should adopt would be a sliding scale according to distance, especially for third-class traffic. I am quite sure that the working people would travel a great deal more than they do if they could travel the long distances at cheaper fares.

14,371. Do you think the working classes of the agricultural district have any great object in travelling about to any great extent?—Not frequently; but they are obliged to travel when in quest of work, and it would be of great advantage to the working classes if they could travel long distances at a cheap rate. A great deal of that travelling is now done by road in consequence of the high fares charged by railway companies.

14,372. Then for long distances you would reduce the fares to a considerable extent?—Yes, the longer the distance the greater the reduction in the fare should be.

14,373. Would you reduce the fares for long distances as much as 50 per cent.?—Certainly, in order to bring the fares within the means of the working classes.

14,374. And you think it would answer the purpose of the railway company to do so?—Yes.

14,375. (*Mr. Gower.*) Are the directors of your company aware of your views with regard to the reduction of rates?—Yes, I have frequently advocated it.

14,376. (*Mr. Ayrton.*) How would you deal with the difficulty of other classes than those for whom the low fares were intended taking advantage of those low rates?—I would confine the low fares to one train a day in each direction.

14,377. Would you make it a class train?—Yes.

14,378. And not a train for all the world?—I would make it a third-class train at very low fares once a day in each direction.

14,379. (*Mr. Gower.*) Do you see any prospect of your views being adopted by your company?—I have no doubt that my company, after the scheme had been fully matured, would carry it out. It is my intention to recommend it to the board.

14,380. (*Mr. Ayrton.*) Is not that what has been done by putting on the parliamentary train, as regards the principle of one train a day?—That is the principle of the parliamentary train, but the fare is too high for long distances.

14,381. Is it not the fact that great numbers of people take advantage of that train for whom it was not intended?—That is not so in North Staffordshire, because nearly every train has third-class carriages attached to it. If we did not carry third-class by every train, we should not carry so much traffic as we do.

14,382. Have you not in your district a line of demarcation between employer and employed?—We have only the line of demarcation that all companies have, distinct carriages and distinct fares for the first class, the second class, and the third class. I am quite sure from the figures which I have had taken out of our books that our greatest increase has been in third-class traffic, thereby proving to me that that is a traffic which we ought to develop.

14,383. In your district does not the population consist more of people who would go by the third class, than it does in other districts where the traffic is of a more general character?—No doubt in manufacturing districts the great bulk of the traffic is third-class traffic.

14,384. And those who consider themselves not to be working people will not travel in that class?—They will not.

14,385. Does that apply to places where the traffic is of a miscellaneous and promiscuous character?—I think it does for long distances; in fact anything over a shilling fare to a working man almost compels him to walk. If labouring men in the agricultural districts have to pay a fare of more than a shilling, they cannot afford to travel by railway, and therefore must walk.

14,386. Does the same feeling exist in other districts which prevents people who would otherwise travel in the third class by the cheap train, for whom it was not intended, from travelling in those cheap trains?—Not to the same extent. I have no doubt that in manufacturing districts persons engaged in business do not as a rule care to mix with people from the potteries or the manufactories who often get into the carriages; but I have been astonished to see very respectable and well to do people travel with people who have just come out of the coal pits and manufactories.

14,387. Might not the effect be that people who now travel first class would go into the second and third classes if inducements were offered them to do so?—I would get over that difficulty by limiting it to one train per day, which should run at such an hour as would be

Mr, P. Morris.
8 Mar. 1866.

an inconvenience to the general public, but a convenience to the class for whom it was intended.

14,388. If the train started at 5 o'clock in the morning that would be an inconvenient hour for the general public ?—No doubt.

14,389. Is not the view which you have stated one that is rather applicable to local traffic than to general traffic ?—No doubt it is more applicable to short lines, but it is equally applicable to this particular class with regard to long distances. For instance, if a poor man wanted to go from London to Exeter I cannot conceive how he can afford to pay for 190 miles at a penny a mile.

14,390. Do any means occur to you by which tickets can be issued to the people as a class rather than leaving it to the classes established by the railway companies ?—No. I think companies would have to take their chance, and I am sure the general result would be in favour of the revenue of the company.

14,391. (*Earl of Belmore.*) What do you think would be the effect of a general reduction of the first, second, and third class fares ; for instance, such a reduction as 30 per cent. ?—I do not think that a reduction below 2*d.* per mile for first-class passengers would be beneficial to the companies. I would recommend a reduction of first-class fares to the extent of 2*d.* per mile. Many companies charge as much as $2\frac{1}{2}$*d.* and 3*d.*

14,392. In fact you do not think that any reduction on your own system would recoup you what you would lose ?—No, I think in a district like ours the number of passengers who travel first class is necessarily limited. They would travel whether they had to pay 2*d.* or 3*d.* per mile.

14,393. (*Mr. Ayrton.*) Your view is, that you would add to the present traffic the traffic of the poorer classes of the country ?—Yes, I want to get something out of the masses. I am sure they are the source to which we have to look for a development of traffic.

14,394. You think there is a great deal of traffic of that kind which might be made remunerative to your company ?—I have no doubt of it. It is a difficult question of how to do it, but I am quite sure the agricultural population has never been touched yet for long distances.

14,395. (*Mr. Horsfall.*) Has your company considered the question of any perfect means of communication between the passengers and the guard ?—Our company has not. As a member of the clearing house conference I have attended the meetings of the larger companies, and have reported to my board what has been done. I recommend them to wait to see the effect of what has been done by companies who have better means of carrying the thing out than we possess. As regards the North Staffordshire, we have never had a single case where communication between the guard and the driver, beyond that which already exists, would have been of the slightest use.

14,396. (*Mr. Ayrton.*) Did you ever see any necessity for communication between the passengers and the guard ?—One has never come within my knowledge except from newspaper reports.

14,397. Have you practically ?—Practically I have never seen a case.

The witness withdrew.

Adjourned till Tuesday next at 12 o'clock.

Tuesday, 13th March 1866.

PRESENT :

The Right Hon. the Earl of Belmore.
The Right Hon. Lord Stanley, M.P., F.R.S.
Sir Rowland Hill, K.C.B., F.R.S.
T. B. Horsfall, Esq., M.P.
Capt. Douglas Galton, R.E., C.B., F.R.S.
E. T. Hamilton, Esq., M.P.
William Pole, F.R.S., *Secretary.*

His Grace the Duke of Devonshire, K.G., F.R.S., in the Chair.

J. Hawkshaw, Esq.
13 Mar. 1866.

John Hawkshaw, Esq., examined.

14,398. (*Chairman.*) You are a civil engineer in extensive practice ?—I am.

14,399. You have seen the summary which has been prepared of Her Majesty's commands to this Commission ?—I have.

14,400. The first point to which the Commission are desired to make inquiry is with respect to the "charges "now and heretofore made by the railway companies "of Great Britain and Ireland for the conveyance of "passengers, parcels, goods, minerals, animals, agricul-"tural products, and other merchandise, and into the "equality or difference of such charges under similar "circumstances, whether as between different com-"panies, or by the same company in different cases." We have had a great deal of evidence complaining of the inequality of charges under similar circumstances ; will you give us your views upon that point ?—If the question applies to the same company, I am not aware that companies do charge unequal rates under similar circumstances.

14,401. The complaint from certain towns is, that other towns are favoured by a comparison of the charges made to them upon the same railway ?—I think that very likely may be the case.

14,402. That might be where the circumstances were dissimilar ?—Yes, so far as I know ; I am not aware of any case where a company makes a different charge under precisely the same circumstances. I do not think the thing exists. But there are cases where companies make a lower charge per mile to one town as compared with another town.

14,403. We have had a great deal of evidence upon that point, and we shall be glad to hear your views in respect of that question ?—I am not able to go into any specific cases, but it appears to me that there may be cases where it is proper and for the benefit of the public for a company to charge in one direction a lower rate than it does in another direction.

14,404. What other circumstances, in your opinion, justify such a difference of charges ?—For instance, cases where the distance the goods are carried is greater, which will justify a less charge per mile, inasmuch as a company can carry a ton of goods a long distance rather cheaper than it can a short distance. That would be one case, and there might be other circumstances, such as gradients and matters of that kind, which might affect the question.

14,405. Do you think gradients have any material influence on the charges ?—I do not think they have, except with regard to the coal traffic, I do not think they affect other traffic very materially.

14,406. The evidence goes to show that there are other reasons which induce the companies to make unequal charges, such as the desire to get a traffic that cannot otherwise be obtained ?—Of course, that is another reason where it may be worth the while of a company whose railway extends between two points, probably circuitous, to induce traffic to go that way by offering a lower rate of charge than they do upon some other line of theirs where no such necessity arises, and I must confess I do not see how the public interests, which I presume are the interests which you care about, can be affected by companies being allowed to do that.

14,407. Take, as an instance, the numerous complaints which have been made from Liverpool, that the

charges from Liverpool to towns in the interior are much heavier in proportion to the mileage than from the southern ports of Hull, Hartlepool, and the Tyne Docks, for example; do you think that is a case in which inequality of charges is justifiable?—It may be; in short, I do not very clearly see why rates should be different from any other charges, or why companies should not be left to deal with rates as they choose. In fact I cannot see any very good reason why rates should be restricted or attempted to be measured by rules of this sort any more than that the prices of merchandise, calicoes, or broadcloths should be restricted by legislation.

14,408. The complaint from Liverpool is, that it is deprived of its natural advantages by the low charges that the railways make in other directions, and that other ports have advantages given to them over Liverpool; do you think the Liverpool merchants have a right to complain of that system?—I do not understand what is implied by the term "natural advantages."

14,409. The advantages of vicinity, for instance?—I suppose the same thing might apply to any other commodity in the same way. One individual may find that he is paying a higher price than somebody else for some reason or other; it will be said that the remark applies differently to railways, because they must go to the railways for their transport, but I think that the question of monopoly had been sufficiently set aside by Parliament, who have already granted four lines of railway between Liverpool and Manchester. I do not think you can usefully legislate for railway rates any more than for the prices of cotton or anything else.

14,410. (*Lord Stanley.*) You look upon it in this way, that as Parliament has fixed the maximum rates, that that is a moral as well as a legal justification for the companies charging any rates they think fit within that maximum?—Yes.

14,411. And whether they think it better to be content with a more limited traffic with a comparatively high profit, or to incur the risk of very low profits, or even a loss, for the sake of extending their traffic, that is a question for them to consider, and not for Parliament?—Yes; but I believe that the object of every railway company necessarily is so to arrange their rates as to secure the largest possible income. In fact, you cannot imagine a railway company acting on any other principle, and therefore its directors, its officers, and staff can have but one object, namely, to secure the largest possible amount of income. Whatever rates will do that I apprehend they will sooner or later arrive at, and they will aim at it. If low rates will secure the largest income, then they will adopt low rates, and the advocates of low rates have generally urged that low rates will secure the largest income. If they will, the railway companies are sure to arrive at low rates. Speaking of rates generally, rates have been greatly reduced since railways first commenced.

14,412. (*Mr. Horsfall.*) Do you think that a railway company, having a line from Fleetwood to Manchester and another line from Liverpool to Manchester, would be justified in taking goods to the detriment of Liverpool at half the rate from Fleetwood to Manchester that they take them for from Liverpool to Manchester?—I think they are justified if it appears to them desirable to charge a less rate per mile from Fleetwood than from Liverpool. It is an old question. I have known attempts made to compel companies to raise their rates; that is to say, to introduce clauses enacting that they shall not charge less per mile between A. and B. than they charge between B. and C. That is a kind of legislation which I think would be mischievous. You cannot imagine that a company would carry at a low rate from Manchester to Fleetwood out of mere whim or caprice. They must do it on some mercantile principle; and if it pays them to carry to Fleetwood at a lower rate than it does to Liverpool, I do not see why they should not be permitted to do it. If you were to put it the other way, and say that they ought to reduce the rate from Manchester to Liverpool to the same as the rate they charge from Fleetwood to Manchester, that might prevent their carrying to Fleetwood altogether.

14,413. (*Capt. Galton.*) Assuming they are carrying at a low rate from Manchester to Fleetwood, do you see any reason why they should not be compelled not to carry at a higher gross sum from Manchester to Preston, for instance, which is between Fleetwood and Manchester?—I do not understand the question.

14,414. Supposing there are three stations, Manchester, Preston, and Fleetwood, on the same line, of which Fleetwood is the furthest, and they carry at a low rate from Manchester to Fleetwood, which makes the amount come to 5*s.*, do you see any reason why they should not be prohibited from carrying at a higher rate than 5*s.* from Manchester to Preston?—Do you mean rate per mile or a toll rate?

14,415. A toll rate?—I do not think you can do that. For instance, if you propose to charge a person 5*s.* to Fleetwood and 7*s.* to Preston, I do not see how you can accomplish that, because a person would take his ticket to Fleetwood and get out at Preston.

14,416. Is it not the fact that that has been done by many lines?—I am not aware of it; I heard some talk of it years ago, but I never met with a case of the sort.

14,417. The London and North-western used to carry from Birmingham to Chester for a lower sum than they charged from Birmingham to Crewe?—I do not know that. I do not see how you are to carry it out if you stop at these places, because if I book myself to Fleetwood you cannot prevent me getting out at Preston.

14,418. (*Mr. Horsfall.*) Is that the fact?—I should think so.

14,419. (*Capt. Galton.*) If a passenger got out at an intermediate station they would ask him for his fare to that station?—I think I remember hearing a case of the sort in which they made some person pay for getting out.

14,420. Should you consider it an injustice if they did that?—I should think it was an injustice if I were prevented getting out at Preston. Suppose, for instance, that the company chose to run a train from Manchester to Fleetwood without stopping, say for 4*s.*, of course, if it did not stop at Preston the passenger could not get out; and then they run another train from Manchester to Preston for 5*s.*, of course that is an anomaly, but still it appears to me that there may be cases in which it may be worth while to do that and the interests of the public not be damaged.

14,421. (*Chairman.*) May it be done, not only with respect to passengers, but with respect to goods? In some instances do they not carry a ton cheaper than they do in other instances?—The law recognizes that principle in all Acts of Parliament, because in all Acts of Parliament of the great companies, such as the London and North-western and the Lancashire and Yorkshire, the companies are required to carry at a lower rate for a long distance than they are for a short distance.

14,422. (*Sir R. Hill.*) After deducting the terminal charges?—Yes, there is what is called the short-distance clause. I think it used to be divided in this way, the first 50 miles, then beyond the 50 miles, and so on. In some of the old Acts that was done, and it was done on grounds which are quite right, that if you can have a loaded train, and can carry it 100 miles, you can carry the goods in that train at a less rate per mile than you could for a shorter distance; it pays better than the short-distance traffic.

14,423. (*Chairman.*) Do you think, on the whole, that the interests of the public and the railway companies coincide with respect to the charges that are made on the railways?—Yes; I think the interests of the public and the railway companies do coincide, of course if the railway companies had, as is very frequently asserted, a monopoly of traffic, it is possible you might have railways managed so as not to coincide with the public interests. I do not see, even then, that it would necessarily have followed; but looking at the fact that there has been no such monopoly practically, and that companies have been allowed to make railways pretty nearly whenever they have sought power to make them, I

J. Hawkshaw, Esq.

13 Mar. 1866.

cannot see in what way railways can have interfered with the public interests.

14,424. (*Mr. Horsfall.*) You do not mean to say that the interests of railway companies in particular localities are identical with the public interests?—No; I am speaking of the public interests as a whole.

14,425. But not as regards particular localities?—No, not as regards particular localities probably. I am speaking of the public interests as a whole.

14,426. (*Chairman.*) We are desired to inquire into the actual cost of conveyance. Is not the cost of conveyance of goods and passengers pretty accurately ascertained?—I should think so.

14,427. Is there any dispute amongst those connected with railways as to what the actual costs of conveyance are at the present time?—I think not.

14,428. Is not the average cost of conveyance of a train per train mile in round numbers about 2*s.* 6*d.* per mile?—You are speaking of the prime cost.

14,429. Yes, the actual cost of such conveyance?—Yes, about that. If you compare the cost of a coal train with a passenger train it varies very much, but the cost of a passenger train is pretty well ascertained. Of course a coal train of very large weight would be more costly than a train of a smaller weight.

14,430. Is there much difference between the cost of a passenger train and a goods train?—That depends partly upon the speed. If you require to run a mineral train with anything like the rapidity of a passenger train, then the cost becomes very much greater. If you are to carry minerals with anything like economy, I think that a mineral train ought not to travel at more than one-third of the speed of passenger trains.

14,431. (*Sir R. Hill.*) But even with long passenger trains, running at the same speed, does not the cost vary in some degree with the length of the train?—Of course it does.

14,432. A train consisting of a larger number of carriages would cost more than a train consisting of a smaller number of carriages?—Certainly.

14,433. Can you inform the Commission as to what would be about the cost of adding one carriage to a train of the average length—say eight or ten carriages?—In order to answer that question I should require to know the number of carriages already attached to the train, it must be in proportion to the whole.

14,434. Suppose a train to consist of eight or ten carriages, and another carriage is added, that would to some slight extent add to the cost of running the train, can you say to what extent?—It is almost an arithmetical rule. Assume a locomotive which would be drawing a train of ten carriages weighed 30 tons, the ten carriages would possibly weigh 40 tons. Of course the cost of conveying that train would be the cost of running the locomotive with ten carriages. If you add another carriage to the train you do not add more than about one-seventeenth to the cost.

14,435. Would the cost of locomotion increase in proportion to the additional weight?—I am taking it in proportion to the entire weight, I am including the weight of the locomotive. Of course if the locomotive is moving itself and the carriages, the cost of the train must consist of the cost requisite to move itself and the carriages, and if you add another carriage to it you must add to the cost its proportionate quantity.

14,436. Are you speaking of the cost of locomotion?—Yes.

14,437. In addition to that there is the wear and tear of the carriages and the injury to the road?—Yes.

14,438. Has not the clearing house a rule as to the allowance to be made by one company which shall use the carriages of another company?—Yes, there is a rule as to an allowance being made for carriages and waggons.

14,439. Do you know what the allowance is?—No, I do not know the charge, but they have a rule by which they charge each other. Supposing the carriages of one company pass on to the line of another company, the other company has to pay for the use of those carriages. It is a small sum and cannot be considered as representing the true cost, inasmuch as they look upon it as an interchange of stock, and it is, generally speaking, considered to be rather under the cost.

14,440. If the addition of a carriage to a train adds to the actual cost of the train, and no doubt it does, then I presume the subtraction of a carriage from the train would diminish the total cost?—Exactly.

14,441. Can you say what would be the minimum cost of the running of an engine with a single carriage?—Of course the minimum cost of the running an engine would be the cost of the engine itself. If you add a carriage to it you would affect it only in a very small proportion; I apprehend just in proportion to the force required to move the carriage as compared with the force required to move the locomotive.

14,442. What would be the cost of running an engine by itself?—I do not know that I can give you an answer to that question which you could take as any accurate measure of the cost. The cost of locomotive power has relation to the cost of conveying the trains. Of course it can be ascertained, but I do not think I can venture to give it, because I should only be making a guess, which would be dangerous.

14,443. (*Chairman.*) The common method of ascertaining the cost of running a train is to apportion the expense of maintaining the permanent way, and the general charges and rates and taxes, all that is included?—No doubt.

14,444. Railway accounts are not kept in such detail that it is possible to ascertain exactly what proportion ought to be attributed as the cost of running a goods train, and what proportion ought to be attributed as the cost of running a passenger train?—Yes, I think they are generally.

14,445. For instance, with regard to the permanent way, can you say how much that is?—With regard to the permanent way you will perhaps have some difficulty, but the large companies keep the cost of their locomotive power used for the conveyance of goods separate from that used for the conveyance of passengers. They also keep the cost of their waggons separate from their carriages, and therefore all those charges can be separated. The permanent way is not kept separate.

14,446. (*Mr. Horsfall.*) Can you give any reason to justify such a discrepancy in the rates of charge as the following. For instance, goods from Grimsby to Liverpool at the rate of $1\frac{3}{7}d.$ per ton per mile; from Hull to Liverpool at the rate of $1\frac{2}{3}d.$ per ton per mile; from Ashton-under-Lyne to Grimsby at the rate of $1\frac{2}{3}d.$ per ton per mile; from Ashton-under-Lyne to Hull at the rate of $1\frac{2}{3}d.$ per ton per mile; from Ashton to Hartlepool at the rate of $1\frac{4}{7}d.$ per ton per mile; and from Ashton to Liverpool at the rate of 3*d.* per ton per mile?—The clause, which is called the variable-distance clause in the Acts of most of the large companies, would justify it to a certain extent. The distance from Ashton to Hartlepool is greater than the distance from Ashton to Liverpool. That would, to a certain extent, account for it; but I do not pretend that I could give the reason for it, because I do not know all the circumstances under which it arose. I am not sufficiently acquainted with the circumstances to explain it.

14,447. You know those lines?—I know the lines quite well.

14,448. You are not aware of any peculiar circumstances which would justify it?—The distance you have given for the low rates is greater than the distance you have given for the high rates. You have taken Ashton to Hartlepool and Ashton to Liverpool, which is double the distance. The rate may properly be lower for a longer distance. You carry coal, perhaps, 150 miles at $\frac{3}{8}$ths of a penny per ton per mile, whereas for a short distance you charge $1\frac{1}{2}d.$ or 2*d.* per ton per mile. Therefore that principle would account for the diminution of the rate on the longer distance.

14,449. Do you think it would account for it to such an extent as I have stated?—In other things the difference is greater than that. For coal carried a long distance to London they get now $\frac{3}{8}$ths of a penny per ton per mile, whereas you will find where the distance is

short, they charge perhaps 2*d.* per ton per mile. Those differences would be greater than the differences you have given; that is a thing which has been recognized by Parliament always; in fact we were compelled, on obtaining our Bills in 1851 or 1852, to diminish charges when the distances became greater.

14,450. (*Mr. Hamilton.*) Do you suppose that the actual cost of conveyance is uniform upon the different main lines of railway?—The actual cost of conveyance is modified to a certain extent, although not to so large an extent as is generally assumed, but still to a considerable extent.

14,451. Do you agree with Mr. Bidder's opinion that the normal expenses are 2*s.* 6*d.* per train mile as applied to all the main railways in the kingdom?—If he means normal expenses, subject to a variation of gradients, I do.

14,452. We may take the actual cost of conveyance upon the different main lines of railway at 2*s.* 6*d.* per train mile?—I think so, subject to modifications.

14,453. Subject to small modifications?—Yes.

14,454. (*Sir R. Hill.*) And understanding that, I presume, to represent the average?—Yes, of course.

14,455. (*Mr. Hamilton.*) But, I suppose, in certain special cases there might be a great departure from that average cost?—Yes; there would be a great departure where you get a locomotive carrying a very long train.

14,456. (*Mr. Horsfall.*) Do you include minerals in that average?—I should think so; but that is a matter which I cannot speak to.

14,457. (*Mr. Hamilton.*) Do you suppose that the differences are so great in certain cases as to make it a source of error to argue upon averages?—Yes; I do not think you can argue upon averages. It depends upon what the object is. It will depend upon the result you are aiming at. For instance, it will be a source of error if you are applying your average price to some special train which may not be an average train In fact, you cannot apply averages to individual cases without error.

14,458. It has been broadly laid down by Mr. Bidder that we may assume the actual cost of what he calls the normal expenses to be 2*s.* 6*d.* per train mile. What I want particularly to ascertain from you is, whether you think it would be a source of error if we were to assume that this was generally applicable throughout the kingdom?—Certainly, if you are going to apply that to individual cases, it would no doubt lead to error. You might have locomotives running, there are cases of that sort in connexion with the Post Office, with one carriage or two, or you may have locomotives, as is the case on the Taff Vale Railway, drawing 60 or 70 waggons loaded with coal, and of course if you were to apply an average price to that you would be wrong.

14,459. The average is only fit for generalization, and could not be made the basis of any legislation on the subject?—Certainly not.

14,460. (*Earl of Belmore.*) If you wanted to apply either to mineral traffic or passenger traffic 2*s.* 6*d.* per mile, which is the average, it would not apply to either?—Certainly not.

14,461. (*Sir R. Hill.*) It would be too much for passenger traffic and too little for mineral traffic?—It might be.

14,462. But not too much for long excursion trains with, say, a thousand passengers?—No; in fact you could not apply an average to that.

14,463. (*Mr. Hamilton.*) Therefore, in order to arrive at the truth, we ought to take the special circumstances of any particular case into consideration?—Certainly.

14,464. (*Chairman.*) In cases where one company works the line of another, is there often an arrangement made for so much per train mile?—Yes, that is sometimes done.

14,465. Do you know what is the sum within certain limits that is usually agreed upon in those instances?—I do not recollect; in fact there are not many cases of that sort. There have been very few; but in that case the price per mile will have been formed upon the ascertained average trains of that particular line, which might be light or otherwise. There are very few cases of the kind where one company works the line of another upon an average rate. The Great Eastern used to work the Tilbury line; but I think they have given it up for an average rate per mile. I do not remember at this moment the rate per train mile.

14,466. (*Mr. Horsfall.*) Can you suggest any remedy in the event of differences arising between the railway companies forwarding goods, with reference to the terminal charge, without the necessity of going to a court of law?—No, I cannot; and I do not see that any better remedy is wanted than you have got at present. I cannot suggest any. I remember an instance which happened some time ago, when I had more to do with railway management than I have now, where a case of the sort arose; it was settled very speedily, without much trouble. A manufacturer at Halifax was aggrieved at a terminal charge, and he objected to pay it, or rather he paid it under protest, and sued the company for the difference. The matter was taken before a county court judge, who heard the company's evidence as to what the terminal charges consisted of, and what they thought they were worth. The manufacturer brought forward his witnesses, and he stated what he thought they amounted to, and the county court judge decided the case at once.

14,467. Do you see any difficulty in the insertion of a clause fixing a maximum terminal charge in all cases?—Yes; I see the same objection to that as I see to all clauses affecting rates. I do not see how you are to fix it.

14,468. Might you not have a maximum rate of carriage?—You could not have one maximum, because it would lead to nothing. The terminal charge in London is very large, and if you made that the maximum it would not have the slightest operation in the country.

14,469. Could you not have a scale?—Then you would be obliged to have a very lengthy scale, and I think you would get very frequently into litigation.

14,470. (*Chairman.*) What do you understand by the term "terminal charges?"—A terminal charge is a charge made by the company at its station for special services, which are beyond the service of carrying the goods from station to station, that is to say, for what they call "handling," which is manipulating, for "sheeting," for weighing, for wharfage, and a variety of other things; that is what is called a terminal charge.

14,471. Do you include in that the interest on the capital expended on the sidings?—I think in a case which was tried, at which I was present, the sidings were not reckoned; it was simply for the men employed at the terminus in handling the goods.

14,472. (*Mr. Hamilton.*) Not the cost of the terminus?—No; as far as I recollect, I am only speaking of that particular case. In other cases they may have raised the question of charging for stations.

14,473. (*Chairman.*) Do you include the shunting of the engine?—Yes, that is part of it.

14,474. In London it is a very large charge, and is composed partly of the charge for the cost of stations, because the railway company in London has to provide a very large station?—

14,475. (*Mr. Hamilton.*) If the cost of the station is not included, there is no reason why the London terminal charge should be so much in excess of the terminal charge at other places?—Not for mere handling; but the cartage in London is more expensive. There are two terminals; there is a terminal on goods, which is for mere handling when they are fetched by the owner in his own cart; and there is another terminal, which is called a cartage terminal, where the company carts the goods away and delivers them.

14,476. Interest on the cost of premises is surely a legitimate terminal?—I think it is.

14,477. (*Sir R. Hill.*) Would that stand in the way of laying down a maximum for that kind of terminal charge; I presume that where the cost of the station is large the traffic is large?—It is so usually, but not always; not in proportion to the cost. For in-

J. Hawkshaw, Esq.

13 Mar. 1866.

stance, you may have a station made in a situation which is extremely cheap, which will have as large a traffic as a station made in a situation which is extremely costly. I do not see how you can lay down terminal charges for every article. It is a question which has been tried three or four times. I have known cases in which this question has been discussed, and nobody could decide what the maximum charge should be. If you try to fit the scale to all the various circumstances which may arise, then it becomes so intricate that you never could apply it. If you make it too high, it will fail in its object; and if you tried to make it low you would never get to a conclusion; whereas at present any person, if he thinks he is charged for the terminal charge more than is fair and proper, can protest against it, and sue the company for it. If he is a large manufacturer it is quite worth his while to do so, because it settles the question.

14,478. You spoke just now of proceedings being taken in the county court, you are perhaps aware that in the county court you cannot sue for more than 50*l.*?—That difficulty is met quite easily, because you have only to fetch away a cart load of cotton or flour, or anything else, and ask the company what their charge is, they say so much, then you can pay them, take away the cart, and sue them for the overcharge.

14,479. Would the company answer that question?—They are obliged to answer it, because they have to make you out a note.

14,480. Do they not, in fact, in such a case as that, charge the maximum mileage and say, the remainder is terminal charge?—There is no difficulty in getting at the actual charge.

14,481. (*Mr. Horsfall.*) Every station has its terminal; I presume you would see no objection to the publication of them?—Not the least, I see no objection to it whatever; but they vary. The terminal ought to bear some proportion to the amount of labour. The amount of labour varies enormously on different things. For instance, suppose you have to handle a ton of feathers, a ton of coals, and a ton of musical instruments. The labour in each of those cases varies a great deal.

14,482. (*Lord Stanley.*) It must be a very long list, because anything like a terminal charge would be only a terminal charge divided into three or four classes, which would be an impossibility?—It would be quite impossible. The terminal charge upon coal varies. With regard to the Taff Vale line, upon which I act as consulting engineer, their terminal charge at Cardiff was 1*d.* I remember that being the subject of tremendous litigation. In fact, I remember there were thirteen actions brought with reference to the terminal charge at Cardiff, and although I was the engineer of company, the freighters agreed to refer the matter to me. I think I settled it at 1*d.* per ton, and I rather think it is now reduced to ½*d.* per ton. In some cases it was as high as 2*d.* It varies so much that you cannot publish it, or do any good in trying to make a list of it. I am not aware of a single case where a person who has to sell coal, has any difficulty in determining whether it is right or wrong.

14,483. (*Mr. Horsfall.*) Do you see any objection to the insertion of a clause in every future railway bill to the effect of that which is now inserted in the North Staffordshire Act, namely, that,—"Besides the rates "per mile, which the company are authorized to charge "for the conveyance of goods or minerals on their "railways or canals, they may charge for such terminal "services as are performed by them such reasonable "sum only as may be from time to time agreed upon "between the company and the person sending or "receiving goods, minerals, or other articles of traffic, "or, failing agreement, as may be settled by arbitration "under 'The Railway Companies Arbitration Act, "1859'"?—I do not know that there is any objection to it; I do not know much difference between that and referring it to a county court judge, who has to decide upon the evidence. But the companies should be allowed to make their own charges pending the reference.

14,484. (*Mr. Hamilton.*) What is the law by which terminals are regulated now?—The Act of Parliament says that your rates are to be so and so, and then it says that in addition to that you may charge a reasonable sum for covering, sheeting, handling, and so on.

14,485. Do you think it is possible to improve the wording of that clause by using something more definite than the word "reasonable"?—I do not think you can have a better word than the word "reasonable." That is about as expressive a word as you can have. No doubt the company is bound to prove the reasonableness of their charge when it is disputed.

14,486. What is your own interpretation of the word "reasonable"?—That they do not charge an improper sum. If I wished them to prove that the charge was reasonable, I should ask them to tell me what it cost them, to show what my ton of goods cost to handle, that is, how much it had employed their men, &c.

14,487. I suppose it means that it has some reference to the cost of the service which is rendered?—Yes.

14,488. (*Earl of Belmore.*) They would expect to get a profit besides that, would they not?—Yes, they have a right to a profit, but it must be a reasonable profit.

14,489. (*Chairman.*) Have the terminal charges adopted by the clearing house agreed pretty nearly with the actual terminal charges incurred by railway companies who have a fixed scale of terminal charges?—They have a fixed scale, which agrees precisely with what the companies charge.

14,490. But does it agree pretty nearly with what it costs the companies?—I presume all the companies charge a profit upon their terminals, because the terminal charge is a part of their remuneration, and therefore they all obtain a profit upon it, or ought to obtain a profit upon it.

14,491. (*Capt. Galton.*) As the companies have fixed all the terminal charges for London, do you see anything unreasonable in having such an arrangement fixed by Act of Parliament?—When you say they have fixed the rate, that is not quite correct. The terminal charges which are fixed by the clearing house as between the companies only apply to certain goods; for instance, there are certain classifications which are known at the clearing house, but there is a large amount of traffic to which those charges do not at all apply. For instance, coal, lime, manure, and all those sort of things which are local traffic.

14,492. But still to all traffic on which there are through rates the terminal charges apply except to minerals, which have no terminal charges at all?—Yes, they have terminal charges, but they are very variable; they vary from a halfpenny or a penny up to 4*d.*, and I think in some cases they are as high as 6*d.*, and that is necessarily so, for instance, in the case of a small village or a place where a man requires a couple of waggons of coals to be brought and left on sidings until he can sell them; they have to be left perhaps two or three days, and men shovelling them into their carts as they are wanted. You could not find that man those two waggons and let them remain on the siding for two or three days at the ordinary terminal charge.

14,493. That would be extra accommodation, for which the company are entitled to demand a warehouse rate, or what is called a wharfage rate?—It is often included in what is called a terminal charge. That shows the difficulty of trying to define it by legislation.

14,494. The terminal charge covers certain things does it not?—Yes, but they are very variable things.

14,495. Those things are laid down in the clearing house regulations?—They cannot be defined in any very specific manner because they are so variable. I fear that if you were to try to lay down a law, you would really make the matter much more obscure than it is at present. So long as it is distinctly understood that the company are bound only to make a reasonable charge for their terminal whatever it may be, if you have the power of putting them to show that it is a reasonable charge, I do not see how you can have anything better.

14,496. (*Mr. Horsfall.*) You have the power of taking the opinion of a county court judge?—I think an arbitration by the Board of Trade would be no better on account of the expense attending an arbitration.

14,497. Do you think a judge of the county court could go sufficiently into the merits of the case as to be able to decide whether it was or was not a reasonable charge?—I think so, it is a simple case of evidence; for instance, suppose a person is charged for the handling of a cartload of cotton or flour so much, the company have to prove what they do in handling the cotton or flour; it is a simple case.

14,498. (*Mr. Hamilton.*) If a case were submitted to you, with all your experience do you think you would have any difficulty on the evidence in determining what was a reasonable charge?—Not the slightest.

14,499. (*Mr. Horsfall.*) Suppose the company choose to appeal from the decision of the county court judge, which they would in all probability do, if the decision were against them, then a small trader would be involved in a very serious expense if he had to appear in the case before a higher court?—He probably would.

14,500. Do you not think it desirable that there should be some check which should prevent such an outlay?—If you can devise such a check it would be better; I do not see any objection to it. If they proceed to an arbitration the award is not necessarily binding; you can appeal to the court to set aside the award.

14,501. I suppose the fact as to whether it was or was not binding would depend upon the wording of the agreement of reference?—It is not very usual to set awards aside, but it is a very common thing to try to do so.

14,502. Do you think it would be desirable that the decision of the county court should be final for the protection of the trader?—I think it would be better not to be so, because the county court judge might make a mistake upon the other side; he may charge a freighter too much, or he may give the company too little. I think it better to leave it as it is.

14,503. But suppose a small trader who feels himself aggrieved takes the thing into the county court, and the railway company, with a large fund to back them, takes the case to a superior court, the trader must give it up, and have no redress whatever, because he cannot go to the expense of the higher court?—I do not see how you can get rid of that.

14,504. Would not making the decision of the county court judge final be a remedy?—That would be a remedy; but whether it would be advisable is difficult to say. It may cut both ways; the county court judge may be as liable to make a mistake on the one side as on the other.

14,505. (*Mr. Hamilton.*) It is not easy to suppose a case in which a small trader would be interested in which a large trader would not be also interested?—No.

14,506. There is no allegation of any favour shown to large traders at the expense of small traders?—Not that I am aware of. I do not think there is any difficulty, because on the question of terminals affecting any important trade, there is no difficulty in getting a combination amongst a particular class of traders if it is worth their while to try the question. I do not know of any way in which you can get rid of courts of law; they appear to me to be the necessary consequence of difference of opinion.

14,507. (*Chairman.*) In numerous cases at the clearing house the terminals are limited merely in order to divide the charge on the carriage of goods between different companies, when, in fact, the total charge is much below what the companies would be authorized to charge as their maximum charge per mile?—Yes, that is so.

14,508. In fact the total charge is much under what they would be entitled to charge independently of the terminals?—Yes; I think there may be cases of that kind where companies are carrying for a great distance at a very low charge, but in all those cases they must still first of all take off the terminals.

14,509. In order fairly to apportion the receipts between the different companies?—Yes.

14,510. One point which the Commissioners are directed to inquire into is, whether any considerable reduction in the cost of conveyence is practicable; do you see any practicable means by which the cost of conveyance on railways can be materially reduced?—Do you mean by legislation?

14,511. By any mode?—There are modes by which you might reduce the cost of conveyance; for instance, you could reduce the cost of conveyance were you to adopt the continental system.

14,512. (*Lord Stanley.*) What do you mean by the continental system?—If you were to restrict the number of trains more than is done in this country, and also restrict the construction of railways more than is done in this country, by these two modes you might reduce the cost of conveyance.

14,513. You look upon it in this way, that we are actually making the conveyance by the number of trains that run more expensive, because the travelling public insist upon a greater number of trains being run than are absolutely necessary for the traffic?—Yes, much more. You could reduce the number of trains upon most lines to one half, by which, no doubt, you would reduce the cost of conveyance, but it would not be for the convenience of the public.

14,514. (*Chairman.*) That applies chiefly to passenger trains?—And to goods trains also, almost as much, in fact quite as much as to passenger trains. For instance, the Lancashire and Yorkshire Railway, with which I have been long connected, although it has perhaps the largest merchandise traffic in the kingdom, did not in 1851, when I took pains to inquire into it very carefully, carry more than 38 tons of goods on the average per train. At this day, no doubt, that average has increased, and perhaps now it may be 48 tons. The North-western used only to average 50 tons to a train, but that average has been somewhat increased.

14,515. (*Lord Stanley.*) When we see, as we do on most of the lines, the train leave a station with perhaps half or two-thirds of the first-class seats empty, that I presume indicates that railway companies are compelled by the pressure of public opinion to run more trains than are absolutely requisite for the conveyance of the passengers?—Yes; and it is the same with the goods traffic. The locomotives that were drawing the small average trains were capable of drawing 200 or 300 tons of goods, but they did not get that quantity of goods to draw, because the manufacturers in the various towns, Halifax for example, want to send their goods down to Liverpool to be shipped, they require the company to send their goods at a given hour to arrive in Liverpool at a given time, and if the company did not send them they would quarrel with them and send them by some other route which would complete the journey within the required time. By that means the average load is reduced, and thereby the cost is increased. But upon many portions of the continent with which I am acquainted they care less about these remonstrances and complaints. They tell the public you shall have a certain number of trains a day, and as to the public finding fault with that arrangement or quarrelling with it they never think of such a thing. They can thus carry goods cheaper. And it is the same with passengers. If you compare our trains with the trains in France, for instance between London and Manchester and Liverpool, you have about 10 passenger trains per day, but between Paris and Lyons you have six, and between Paris and Marseilles only five.

14,516. (*Capt. Galton.*) Do you think it is a fair comparison to make, to take the distance between Paris and Lyons, which is greater than the distance from London to Manchester?—I am about to give other cases where the distance does apply. From London to Manchester and Liverpool you have ten passenger trains per day.

14,517. (*Sir R. Hill.*) Each way?—Yes. From Paris to Lyons you have six, Paris to Marseilles five, Paris to Bordeaux four. If you take things nearer

J. Hawkshaw, Esq.

13 Mar. 1866.

home, say London to Dover, you have eight trains per day, but from Paris to Calais only five.

14,518. (*Capt. Galton.*) Can you give the number of trains from London to Glasgow?—I am afraid not. From London to Portsmouth you have eleven, to Southampton nine, to Plymouth six. From Paris to Rouen you have five, to Havre four, Dieppe three, Brest three, Cherbourg two.

14,519. (*Sir R. Hill.*) Can you give the average number of passengers in each case?—I cannot do that. If you go to Prussia, from Cologne to Berlin you have only four. If you go from Prussia to Russia, for instance from St. Petersburgh to Moscow, where the traffic is enormous, you are restricted to two trains per day. I have had to go between these two places on more than one occasion; but although the traffic is very large, there are only two trains a day. I merely give these instances in order to explain what I mean that you can reduce the cost of conveyance in this country, that is physically, provided you change your habits to the habits of the continental people, and consent to travel by a limited number of trains per day.

14,520. (*Lord Stanley.*) Then it comes to this, that the English traveller insists upon having a first-class conveyance ready for him whenever he wants it, and that is a luxury for which he must pay extra?—Yes.

14,521. (*Sir R. Hill.*) Do you know whether a company has ever tried the experiment of appointing a small number of trains per day, and having lower charges by those trains than by any others?—That is tried in excursion trains; it is very much the same thing as an excursion train where people have to wait and start at some particular time of the day, such as six or seven o'clock in the morning; and are accumulated in large numbers and taken to the end of their journey, and on these occasions you do charge less, and get larger train mile receipts.

14,522. Then it may be the case that the profit on an excursion train is as great, or in fact greater, than the profit on the ordinary train?—I think sometimes it is greater. I think it is considerably greater.

14,523. (*Lord Stanley.*) Do you think, as a matter of fact, that English travellers on any great line of traffic, such as between London and Liverpool, and London and Manchester, would consent to put up with half the number of trains in the day if the inducement were held out to them that by that means they could be carried at considerably lower rates?—I think not.

14,524. (*Earl of Belmore.*) With regard to the ordinary passenger trains, must you not provide, not merely for the average, but for the maximum number of passengers in the day?—Yes, you have to provide for the maximum, and you have to provide power and carriages for a larger number of people than you usually carry.

14,525. (*Sir R. Hill.*) Does not the difference between the practice in this country and on the continent arise very much from the greater value of time here?—Yes, our time is more valuable, and we are willing to pay for despatch; indeed nothing could induce us to wait until we had accumulated a larger number of passengers. Another thing is also to be considered, that you could reduce the charges in this country in another way, but this country would not bear it. You could reduce the charges by putting a restriction upon the construction of lines. Supposing you had given to the original London and Birmingham Railway the absolute monopoly of that district, and said you shall have no more lines to compete with you, they would have been able to carry at a lower rate. That is what is done on the continent. We do not do so, and I think it would be a national calamity if we did.

14,526. The construction of competing lines does not in your opinion produce the effect which is generally expected, namely, that of lowering the fares?—No; not in that sense.

14,527. It would have the effect of increasing the fares, would it not?—If you restricted London and Liverpool to one line, you could have made it worth the while of that one line to have carried the public at a lower rate, but then you would have deprived the country of an enormous amount of railway accommodation which it has got by the construction of other lines. I believe that the country gains, probably, twice as much from the construction of railways as the proprietary gain, that is to say, that the proprietary of all railways in England get about half the profit the country gains from the railways.

14,528. In what shape does the country obtain a profit?—By the reduction of charges and the facilities of transport.

14,529. And by the increased value of its property?—Yes; but I am dealing with the question of what the country would have paid by the old system of transport; I am of opinion that the country has gained twice as much by the construction of the railways as the railway companies themselves have gained. I proved in 1851, to the satisfaction of a committee of the House of Commons, that at that time the Lancashire and Yorkshire Railway had been beneficial to the district through which it passed to a much greater extent than to its proprietary; the rates have been reduced since then, and I am sure since then it would be quite safe to take it at double. Therefore it would be great folly, I think, for the sake of getting a low rate, to adopt the continental system, either as respects a reduction of the number of trains, or as respects the repression of the number of railways.

14,530. Without reducing the number of trains might not the same result be effected by lightening the trains?—In what respect?

14,531. By reducing the number of carriages required for the conveyance of passengers?—I do not see how you can do that except you reduce the number of passengers.

14,532. Do you not find it to be the case that in every train there is a very large proportion of empty space?—Yes; that is a great loss, no doubt, to the companies, but the companies cannot avoid it, because although they may on some occasions have a considerable amount of empty space in their trains, still there are occasions on which they will be filled; and indeed cases occur in which the trains are not only full, but there are people who cannot find seats.

14,533. Does not that arise very much from the preference for particular carriages, rather than from the number of passengers being large upon the line?—No doubt a great deal of it arises from running what are called through carriages.

14,534. If the public would submit to the inconvenience of stepping from one carriage to another, would not that afford the means of reducing the cost?—Yes; but there is nothing the public are less inclined to submit to than that. There is nothing that the public grumble so much at as changing carriages.

14,535. If the public would consent to leave a carriage at the point of junction, and take a vacant seat in a carriage by which they might afterwards proceed, it would enable the companies, to some extent, to reduce the charge?—It would; but then that would be depriving the public of a convenience which they require, which I do not think they would submit to. Therein is the difference between our English travelling and the continent. Belgium is a country which is often alluded to in reference to the low rates upon the railways, which are there under government control. I have had occasion to pass through Belgium frequently for the last eight or nine years. I cannot imagine anything worse than the travelling in Belgium. People in this country would not tolerate it. If you go by way of Ostend they deal with you rather better. The railways belong to the government, and the government wish to encourage that route, and therefore they make that pretty good; but if you go the other way they make it as bad as possible. If the railways in Belgium were in the hands of a number of companies they would do something to please the public, and make matters more convenient to passengers.

14,536. It appears to be your opinion that so long as the people of this country expect to have a train starting just when it suits their convenience to travel, and

so long as they attach value to the convenience of retaining their seats when they have to be transferred from one line to another, that there is but small hope of a large reduction in the cost of conveyance to the public?—I think so. Of course the fares have been considerably reduced from what they were when railways first started. There has been silently and quietly a reduction of fares going on from what they were 20 years ago.

14,537. I presume that has resulted from the companies finding from actual experience that they obtain a larger profit from moderate fares than from high fares?—Yes.

14,538. Do you think that process of reduction will continue?—It may to a certain extent. I am quite sure it will continue so long as the companies find that by reducing their fares they can gain a larger income.

14,539. Does it not frequently happen that the proprietors of a railway are unwilling to wait the time which is necessary to effect a change in the habits of the people?—I think companies, like everybody else, make their experiments cautiously. My opinion is, that if they are disposed to err at all, it is to try to get upon their lines the largest amount of traffic that they can, whether it pays or not. I have heard it said by gentlemen who profess to reform railways, that railway managers are apt to be lethargic, and that they do not cultivate traffic at low rates. As far as my knowledge goes I think they are rather given to attempt to obtain the largest amount of traffic, sometimes whether it pays the company or not.

14,540. You think they are too apt to look to the gross receipts?—Yes, to the gross receipts and large returns, without reference to profit. If there is a tendency to err, I think that is the tendency.

14,541. (*Mr. Hamilton.*) You state that railway companies are more disposed to pay attention to the wants of the public in this country than they are abroad?—Yes, our whole system is different.

14,542. (*Mr. Horsfall.*) I suppose in this country the public are more willing to pay for the accommodation?—The public in this country have more influence and power than they have abroad.

14,543. (*Lord Stanley.*) The public here are less willing to submit to that degree of control and restriction which exists in the continental lines?—Yes.

14,544. May it not be owing to the influence of the public who are in the Houses of Parliament?—Yes; it is owing to the influence of the public generally on every matter affecting their convenience.

14,545. (*Chairman.*) In point of fact, are foreign railways in general worked at a much smaller cost than English railways?—The fares are rather lower.

14,546. Are their expenses lower?—No, not always; with regard to Russian railways, with which I have to do, I think some of the expenses are, if anything, higher.

14,547. Do you know anything about the expenses of the French railways?—The expenses may be lower on French railways, wages are a little lower than here.

14,548. You said that you think you could reduce the cost of English railways by adopting the French system?—I meant in reference to diminishing the number of trains, and thereby increasing the number of travellers per train; and also, by the other means, that is, by restricting the construction of railways, which I take to be a part of the continental system, and a very important part.

14,549. (*Earl of Belmore.*) Do you think that the difference in the cost of fuel in the two countries makes any difference in the cost of the train mileage?—I should think our fuel will be a little cheaper than in France.

14,550. (*Capt. Galton.*) How will having fewer railways reduce the cost of working?—By increasing the average weight of the trains. There is no doubt that you can carry 500 tons of coal in one train at a less rate per mile than 50 tons. Limiting the number of railways and diminishing the number of trains would have the effect of increasing the average loads. But I do not advise such a course.

14,551. (*Chairman.*) Are we to understand that it is your opinion that railway companies are proceeding, as fast as prudence will admit, in making experiments as to the reduction of their charges and fares?—I think so. I cannot conceive that they should do otherwise.

14,552. (*Mr. Horsfall.*) Are they not in some measure prevented from doing so by extending their lines into districts of country which do not remunerate them?—Of course, that is a mixed question; there is no doubt that, to the extent that companies make unremunerative branches they diminish their power of reducing rates to the public, but still I am not aware of any lines that are being made, or have been made, which in a national point of view ought to have been prevented from being made.

14,553. (*Chairman.*) Have you paid much attention to the question of third-class traffic? Do you think that the arrangements upon railways are such as at present to afford to the labouring classes as much opportunity for travelling as they would be glad to avail themselves of?—As a rule I should say that is the case, if you take companies in whose districts there is a large amount of third-class traffic, they afford every encouragement to it. I think it is the fact that of the whole passenger traffic of the Lancashire and Yorkshire, about 80 per cent. is third-class traffic. I think that where a company can acquire third-class traffic, it is their interest to do so, and I think they always do it.

14,554. It is not the practice of most of the railway companies to attach third-class carriages to all their trains?—No, they do not attach them to express trains.

14,555. Do you think that they ought to attach third-class carriages to all trains, except express trains?—I cannot speak to that; my impression is that they will attach them to all trains where they are likely to be productive of benefit.

14,556. Is there not a general feeling amongst railway companies that they can compel a considerable number of passengers to travel second class who would travel third class if third-class carriages were provided?—That used to be the case a long time ago, but I am not aware that that is the impression now. Of course there are cases where companies would not like to have third-class carriages attached; for instance, to some of the long trains, where the stations at which they stop are few, it would not be worth their while to attach third-class carriages; they would not get a large amount of traffic; they would only encumber the train with an extra weight of carriages; it is not worth while to attach third-class carriages generally, except to those trains which intend to stop frequently; they are the only trains which really accommodate third-class passengers.

14,557. (*Sir R. Hill.*) Third-class passengers usually only travel short distances?—Yes.

14,558. Is it not the fact that a very considerable number of third-class passengers is likely to delay the progress of the train, by stopping longer at the stations?—No doubt; third-class passengers never know which is their own carriage, and they frequently get into the wrong carriage.

14,559. They are not so much alert as the other classes?—I think they are more careless.

14,560. (*Chairman.*) Are you acquainted with any lines which pass through agricultural districts?—A portion of the Lancashire and Yorkshire in the Goole district is purely agricultural.

14,561. Do you think, generally speaking, that lower fares would answer better in a manufacturing district than in an agricultural district?—They answer best when distances are short; when you want to induce people to travel very short distances, the fares must necessarily be low, because people have to walk to and from the railway, and unless you make a very low fare, they will not travel a very short distance by railway.

14,562. I think you have incidentally, in answer to some of the questions which have been put to you, intimated that your opinion is strongly averse to the railways being the property of the Government, is that your opinion?—That is my opinion.

J. Hawkshaw, Esq.

13 Mar. 1866.

14,563. Do you think that the public would not have as many advantages if railways were the property of Government as they have now?—I do; I think if Government had taken up the railways of this country at an earlier period, or if they were to take them up now, the first effect would be to diminish the construction of railways. I think that railways would not have been extended as rapidly as they have been, and I doubt very much whether in any other respect the public could have been benefited by a Government management of railways.

14,564. (*Sir R. Hill.*) Do you think it would be bad as compared with what it now is?—It is not that I mean; but railways at present are in this position, a very large number of individuals are all interested in devising modes of railway communication wherever they think that railway communication would be of advantage, and they are also interested in improving their management. You have now an enormous staff at work, that staff being a portion of the public, and the intellects of all these men are incessantly occupied in improving and extending existing railways, you would not have this if the Government had the charge of the railways. The management of railways would devolve upon one or two individuals. You cannot expect that one or two individuals, if they were the ablest men who could be found, would do as much towards the promotion of railways as the public do themselves.

14,565. Supposing the Government were to lease the railways; do you think the management would be less able than it now is?—Do you mean lease them to companies?

14,566. Lease them to companies or to individuals?—That would lead to lamentable consequences, in my opinion. It is a plan which I have had occasion to consider. Your brother did me the honour to communicate to me his view upon the subject of the Government management of railways, he admitted that the idea of Government managing railways by themselves would be politically out of the question; that is to say, Government would never be allowed to control the great number of employés who attend to railways. His view was that the Government should take the railways, not to manage them themselves but to lease them to companies to be managed.

14,567. Lease them to companies or to individuals?—Yes; in my opinion that would not work. In the first place, the conditions under which a company would lease a railway are very difficult to be defined. The lessees would, in my opinion, in spite of the Government, get very much their own way; and when quarrels arose they would bring their influence to bear on the Government, as I have known in other cases of Government contracts, which I could mention if it were proper to do so; and at last the Government would give way.

14,568. That is to say, the plan would not succeed if the Government did not perform its duty?—It would be difficult for Government to perform its duties in a matter of this sort, when there would probably be 200 or 300 votes for seats in the House of Commons to be considered.

14,569. It would, however, depend very much upon whether Government could perform its duty, or not?—I do not think it would be possible to control the great lessees of all the railways. Besides, I do not see what advantage you gain. If the Government are to take the railways, and hand them back again to the present companies or to similar companies to work, I do not see the good of the process; in fact it would lead to this, companies at present have some interest in managing the railways well,—they are their own property, and therefore they have an interest in managing them well. But if you make them lessees only, their interest then would be to manage the railways so as to put as large a portion of the proceeds as possible into their own pockets. There have been many cases in which companies have leased their lines to repair or work, and have handed over to the lessees their stock. It has been found that the lessees put a large portion of the rent into their pockets, and laid out as little as possible in repairing the railway; and in the other case they have allowed the stock to get out of repair. I can see no advantage the Government would gain by taking the railways, and handing them back again to companies to work.

14,570. In the cases you have mentioned the leases must have been granted by railway companies?—Yes.

14,571. Then you are citing instances of mismanagement on the part of railway companies?—Yes; and I am giving instances to show the difficulty of working railways by leasing them. I think it is a difficulty inherent in the system.

14,572. Might you not without much difficulty cite other instances of mismanagement on the part of railway companies?—Probably; but I only mention these cases to show the impossibility of working railways well by leasing their working.

14,573. But that would depend, would it not, on the care taken in the construction of the lease, and in enforcing its conditions?—Of course the conditions of the lease would be an element to be taken into consideration. But you would have an antagonist in the company, because it would in that case be to its interest to get as much as it possibly could out of the proceeds, and neglect the railway as to its repairs, stock, and so on.

14,574. Do you think it would be impossible to prevent that?—I think it would be very difficult. And I cannot see the slightest benefit which would be derived from the plan if carried out. I do not know what good would be effected, except that Government would take upon themselves a very heavy burden.

14,575. Is not Government able to borrow money upon better terms than railway companies can?—At present it is; but I very much doubt whether, if they undertook to work railways, their credit would not suffer.

14,576. (*Lord Stanley.*) Supposing Government borrowed 100,000,000*l.* of money for such a purpose as has been described, would not the effect of that be to raise the rate of interest which they would have to pay?—Yes. I do not see that the Government credit in that respect would differ very materially from anybody else's credit. If they wanted an enormous sum of money they would no doubt have to pay a higher rate of interest.

14,577. I suppose as far as security goes, the security of a company like the North-western is as good as that of the State?—I think so.

14,578. (*Sir R. Hill.*) Do the North-western obtain money on equally advantageous terms as the State?—Not quite; but they obtain money on very advantageous terms. I do not think it would be quite safe to assume that if the Government required to borrow two or three hundred millions of money its rate of interest would remain the same as it is now. I do not mean to say that there might not be some slight advantage in favour of the Government; but that is surely not sufficient to make it worth the while of the Government to trouble itself with the management of all the railways.

14,579. (*Chairman.*) You do not think there would be any motives which would influence a small body of leaseholders different from those which actuate a large body of shareholders?—I think the leaseholders would be much more troublesome people, and much more indifferent and careless about the management of the railway.

14,580. (*Sir R. Hill.*) Do you think that if each of the railways had been leased to three or four intelligent men, such as the railway managers and engineers are, the lines would not be better managed than they are at the present moment?—That depends on what you mean by "leased." Leased in what fashion?

14,581. That the lessees should pay a given rent for the use of the line, with the right to make charges for passengers and goods, within certain limits, as they now do?—If they are to have the right of using the line at a given rent, you must hand over to them everything belonging to the railroad. They might pay the rent for ten or fifteen years, and pocket an enormous sum of money by allowing the whole thing to go to ruin. Government could not help it. You

could not meet it, except by having a large staff, and I think not even then.

14,582. Supposing you were yourself a Government officer appointed to see that the roads were not injured, could you not perform that duty?—I could perform a certain portion of it, but I should require a very large staff of other engineers or officers.

14,583. To look after all the railways you would require a large staff?—The lessees would have their staff to look after the repairs; and the Government would require a very large staff to see that the lessees did the repairs; so that you would require to have two staffs.

14,584. (*Chairman.*) You do not think it possible to make a provision for the adequate maintenance of the line in the terms of the lease?—I think not. I remember on one occasion the Lancashire and Yorkshire let the repairs which were necessary to the maintenance of the permanent way, which you would suppose was not so difficult a matter to look after; but we found it so impossible to keep the lessees up to the mark that we had to get rid of the contract. The lessees' object was to put the money into their pockets and do nothing to the railway. The company's object, of course, was to see that they did not do that; and at last we had to get rid of the contract. I think that would be the end of Government leasing railways, and that they would have to get rid of the contracts.

14,585. (*Earl of Belmore.*) In fact, as a general rule, contract work is not likely to be so good as other descriptions of work?—No, I do not see the advantages of such a system. If it were manageable in other respects, I do not see what advantage is gained by it beyond the difference in the rate of interest, which which would be a trifle.

14,586. (*Chairman.*) If a body of four or five experienced railway managers had a line, do you think they would manage it on precisely the same system if they leased it as they would if they were the servants of a company; or do you think they could introduce improvements when they had not a board of directors or a body of shareholders to be responsible to?—It is quite evident, supposing they had the whole line handed over to them, paying a rent to the Government for the lease of it, their interest would be to pay away for management repairs and renewals the smallest sum of money which they possibly could. If they took a lease for 14 years, they might let the permanent way, the bridges and so on, get into such a state of repair as to put into their pockets a large sum of money, and take it out of the pockets of the Government. Of course the Government would try to exercise a control over the lines in order to prevent such a system as that, and would require a very large staff.

14,587. (*Sir R. Hill.*) Have you seen the evidence given by Mr. Bidder before this Commission?—I have not.

14,588. Then you cannot judge of the efficiency of the securities which he suggests in order to prevent the property being injured?—No, I have not seen his evidence. All I know is, and I can speak from experience, that I have had to try to prevent railway property being similarly injured, and I have failed.

14,589. (*Mr. Hamilton.*) Because you could not enforce the penalties?—Yes. Nearly all the large railway companies in the first instance let their permanent way. Some of them let their locomotive power; and I think in every case, so far from working efficiently, it had to be given up. I have no hesitation in saying, so far as my experience goes, that it has been or will have to be given up by all the companies who have tried it.

14,590. In one case I think you stated you had to buy back the contract?—We had to relinquish it. The penalty we paid was the state of depreciation in which it left our property. We found it was of no use going on any further.

14,591. It was not so beneficial to the lessees that they asked you for any compensation upon their giving up their lease?—No. It arose in this way, that we considered the work had been allowed to go out of repair. We called upon the contractors to put it into repair. The contractor would not put it into repair, and we had no effectual means of making him; and at last it ended in our mutually agreeing, as we found the thing would not work, in our getting rid of each other. In every case, as far as I know, the companies who did lease their permanent way or other similar matters, have found it to be a bad system, and have given it up; and I think if the Government were to adopt the system it would lead to a like result.

14,592. (*Chairman.*) Is it your experience that an interchange of traffic between different railways is satisfactorily managed at present; or do you think the public might reasonably require greater facilities in that direction?—I am not aware of cases where the public do not get what they have a right to require. There may be cases, but none occur to me at this moment.

14,593. You are not of opinion that any general measures are required to facilitate traffic between the different companies?—I think not. I think the interchange of carriages, that is, the running of through carriages, is carried quite as far as it prudently can be.

14,594. Do you think that is the case with respect to the through booking of goods?—I think so, as far as I know. Of course there may be special cases with which I am not acquainted.

14,595. What, in your opinion, are the principal causes which have led to such an extensive amalgamation of railways?—I believe it arose, in the first instance, from the opinion that by amalgamation they could stop the construction of competing lines. I think that was the inducement at first. But, as far as my opinion goes, I do not think that it has any such tendency; I think you cannot stop the construction of competing lines so long as railway property goes on improving. When railways begin to pay good dividends, and get up to 6 per cent., as they are doing, or to still larger dividends, nothing will prevent parties projecting railways in districts which have not railways already, nor can I see you should, if you could, prevent it. It appears to me that railways are very much like any other machine or invention, every district that wants them, if anybody can afford and is willing to make them, ought to have the benefit of them, and I can see no interest that the State has to interfere with that principle.

14,596. (*Mr. Hamilton.*) What evidences of the want would you accept?—I think it may be taken as a safe rule that men will not find money to make railways faster than railways are required. I am very much inclined to say with regard to railways that I should leave them as you leave cotton factories, to be made by parties willing to make them, provided that you have some regard to the way in which they intersect or deal with property, because that is a matter which Parliament has a right to inquire into, but, apart from that, I cannot see why you should not leave railways to be dealt with in the same way as you do a manufacturing or mercantile establishment.

14,597. (*Lord Stanley.*) You would require proof that there was at least some *primâ facie* case for a railroad being wanted before you would allow valuable property to be cut up or destroyed?—Yes. I think regard should be had to the property which it is proposed to pass through.

14,598. You would not allow any opposition to a new line which is proposed to be made on the ground of competition with existing lines?—No further than might be necessary to elicit facts. I should not upon that ground *per se*.

14,599. (*Mr. Hamilton.*) According to that, you would be in favour of taking away from railway companies their *locus standi* before committees of the House of Commons?—I do not say that. I think you may allow the existing railways to appear against a railway which is said to be a competitor with it for the sake of bringing out before the committee all the circumstances necessary to be considered, because unless you do allow that, you will not in many cases get any inquiry at all into the proposal. If you

J. Hawkshaw, Esq.

13 Mar. 1866.

allowed nobody to appear to oppose it you would never have a proper investigation.

14,600. (*Lord Stanley.*) Then you would allow them to appear, but you would not allow them to go into the case of any injury to land by itself?—You could scarcely put it so broad as that, because there might be cases of injury to their land or to their works, or by people running across them in a way which would interfere with the capacity or utility of their own undertaking; but what I mean is generally upon the subject of competition, that when a railway company comes forward and opposes a railway which passes miles away from it, and says it ought not to be made through the district through which it passes, (which is supposed to require railway accommodation,) because it may incidentally compete with it; then I do not think that is a valid argument against the railway being made.

14,601. (*Mr. Hamilton.*) Then are you prepared to treat all applications, that is, the general mass of them, as *bonâ fide* applications?—Yes; I believe, and I think that practice will show it to be the fact, that the applications for railways will not exceed, generally speaking, the necessities of the case. When I say applications I mean the result of the applications, because, of course, you will have parties coming forward for two or three lines to serve the same purpose. I believe that railways will not be made faster than the wants of the country justify, simply from the fact that men will not as a rule find money for an undertaking which will not prove remunerative.

14,602. The question is not whether railways will not be made faster than the wants of the country justify, but whether applications to Parliament will not be made faster?—They will, because you often have two or three parties applying for the same line.

14,603. Do you think it would be an unfair thing if Parliament were to lay down some different rules to those which now exist, so as to compel parties who have obtained powers for making a new line of railway to carry those powers out?—They do lay down rules to compel parties to carry them out, that is to say, they make them deposit a certain sum of money in the Bank of England; and with regard to old companies, they make them forfeit their dividends if they do not make the line.

14,604. That deposit in the Bank of England is released at a certain stage of the transaction, is it not?—Yes.

14,605. Would you think it a hardship if Parliament were to impound that deposit until the railway were completed?—I do not see any advantage that would be gained by it; it would be locking up a sum of money for no useful purpose, because when a railway company has made considerable progress with its works I do not see why the money should be impounded.

14,606. As soon as that deposit has been released, has not Parliament taken the guarantee of a contractor who has evaded his liability when it suited him?—Such a case is not within my experience; it may have been so.

14,607. You do not think it is a usual thing?—I hope not. I am not aware of any case of the kind myself.

14,608. But it must be within your experience that railways which have been authorized by Parliament have frequently not been made?—I am trying to recollect a case of the kind, and I cannot do so. No railway with which I have been concerned has failed of being made, and I am not aware of any railways for which bills have been passed which have not been constructed ultimately. They have been delayed, and have had to ask for an extension of time, but I am not aware of any railway for which a bill has been passed which has not ultimately been constructed, although it may have been delayed more or less. I have known several cases where a railway company, having had a certain time to construct their line, have come to Parliament and asked for an extension of time. It has frequently happened that they have obtained an extension of time, but I have known of none that have not been ultimately made. I am not speaking of the year 1846, which was the time of the panic, during that time there were many railways authorized which were not made. I am speaking of the period since.

14,609. There are no means of compelling the promoters to complete the line after they have got facilities for doing so from Parliament?—They would forfeit their deposit if they did not complete it.

14,610. Not after the deposit was released?—They do not release the deposit until after they have expended a large portion of their capital; they ought not to release it unless they get something as good as the deposit. If the Government get something not so good as the deposit, that must be the fault of the Government.

14,611. You think there would be no hardship in proper measures being taken to have the conditions fulfilled?—If Government say that there shall be a deposit of a sum of money, which is to remain deposited until a certain event occurs, then I think they ought to keep the money unless they got something which is quite as good as money.

14,612. (*Chairman.*) Do you think amalgamation in England has nearly reached its limit?—I think in some cases the concerns are large enough; I think that perhaps they are as large as can well be managed.

14,613. Do you think that the amalgamations which have been effected have been of advantage to the public?—I think they have.

14,614. You think the public are not as well served by a number of small railways as they are by a few large ones?—I think not. I think railways thrown into large groups are better for the public in every respect than a number of small railways.

14,615. You are aware that in Ireland there are a vast number of small companies?—Yes.

14,616. Do you think it would be better for Ireland if many of these small companies were amalgamated?—I think it would; it has been beneficial in England, and I think it would be equally beneficial in Ireland.

14,617. Have you considered what has prevented the disposition to amalgamation in Ireland; do you know whether amalgamation has been proposed to such an extent as in England?—I do not know that I have, there is the reason which I alluded to previously, that in England the origin of amalgamations arose from the fact that those companies thought that by amalgamating they would prevent competing lines being formed. In Ireland there is no such apprehension.

14,618. (*Mr. Horsfall.*) Have you considered the question of the more safe conveyance of passengers by means of establishing a communication between the passengers and the guard?—I have considered that a great deal. It is a very old question, and it is a very difficult question. Of course railway companies can have no interest in preventing passengers from communicating with the guard if it would be beneficial; they could easily do it; but it is a complex question. In the first place, all you could do would be, if you made a communication from the passenger to the guard, to authorize the guard in case of being signalled to find out or to ascertain the motive of the person who had called him. He could take no other action upon it. To that extent I see no great objection to it.

14,619. (*Mr. Hamilton.*) You mean he would have to find it out without stopping the train?—You could not, I think, put it in the power of a passenger to stop a train; if you did it would lead to accidents.

14,620. That would lead to a great many accidents and irregularities?—Yes, it would be like giving power to passengers on board a steamer to interfere with the helmsman.

14,621. (*Sir R. Hill.*) It would be not only inconvenient, but very unsafe?—It would be very dangerous. You ought not to give passengers control over the motion of the train; that would be dangerous The circumstances under which it is supposed that it would be an advantage to enable a communication to be established between the passengers and the guard are not very numerous. No doubt in the case of a carriage getting on fire it would be useful. A case of

that kind has happened, and if a carriage were to get on fire it would be useful to be able to communicate with the guard and call his attention to it.

14,622. That is a question which is now being considered by the committee of the clearing house, is it not?—Yes; there are some cases in which it would be advantageous to have a communication between the passengers and the guard. I do not see any insuperable objection to it; I think you would require another guard. I think in every case it would entail upon companies the necessity of having an additional guard, because the guard's duty is to attend to the break, and it would not be safe to allow a passenger to call him away from that break in order that he might listen to some unfounded rumour or gossip, therefore you must have a second guard, but that is a matter of cost only.

14,623. But still, with carriages constructed as ours are would it be possible for the guard to communicate with the passengers without stopping the train?—He would have to walk along the side.

14,624. Is not that considered to be very unsafe?—It is dangerous; it is done a great deal on the continent, and used to be done here.

14,625. Was not the practice abandoned on account of its being so dangerous?—You would be risking the guard's life.

14,626. (*Mr. Hamilton.*) The great object is to attract the guard's attention, in case of the carriage being on fire, for instance?—If you once establish that rule it must have some signification; his attention may easily be attracted to the train to see that it is not on fire. If you want the guard to come to the carriage from which the communication is made, you require an additional guard to do it. I do not see any great objection to it, except the risk of the guard's life, which, undoubtedly, is a great objection.

14,627. (*Sir R. Hill.*) You think that the guard might travel along the foot-boards without extreme danger?—There are some cases in which it would not be safe, because there are some railways on which the tunnels, &c. are very narrow, which would render it dangerous.

14,628. (*Lord Stanley.*) It used to be done in that way?—Yes, and on the continent it is done in that way still.

14,629. (*Earl of Belmore.*) Would it be possible to have on narrow-gauge lines in England the same sort of carriages that they have in use on some of the continental lines?—I think that would be a more effectual mode of meeting the case. On our large railways I do not see why they should not make use of carriages similar to some I have seen in Russia. I do not mean the large American carriages, which are 80 feet long, and in which the passengers can walk from end to end; but they have carriages now in use in Russia, which have been lately made, which are not much larger than our ordinary first-class carriages. They have a compartment at each end; there is then a narrow passage running from the two compartments. They have four compartments, two on each side of this passage, and between two of these compartments there is a small door which leads to the water-closet, and between the other two a passage to the side of the carriage. You can walk along this narrow passage and get to this water-closet or look out at the door, so that you have a great deal of freedom and a great deal of convenience. I can see no reason why a carriage of that sort should not be adopted on our long lines, like the London and North-western. In fact I sent a drawing of this carriage to the Lancashire and Yorkshire Railway Company, hoping that they would make one as a specimen; they have not done so yet, because the circumstances of that line are such that it is not required so much as upon other lines. I will send a copy of the drawing with my corrected evidence. (*See* Appendix CI.)

14,630. (*Sir R. Hill.*) Is the gauge in Russia the same as ours?—Yes, it is practically the same. It is five feet.

14,631. You think there would be no difficulty in widening the carriages?—You could put this carriage on the North-western.

14,632. Would there be any danger of their touching the sides of the tunnels?—Not at all. They are little wider and larger than our ordinary first-class carriages, not so wide I think as some of the first-class carriages which we have on the North Kent line, or the South-eastern. In width and length they could be made compatible with our gauge, and might be put on our leading lines with safety. They would not be very expensive. I think if the long lines which go to Scotland, or Manchester, were to adopt carriages of that sort they would be useful, and I see no reason why they should not be adopted.

14,633. (*Earl of Belmore.*) Is the door of this carriage at the end or at the sides?—The door is at the side.

14,634. If the door is at the side, how would that assist the guard in getting from one to the other?—It would not assist the guard; but then the necessity for communication with the guard would in many cases be removed. Such a carriage would give the passengers many advantages which they cannot have in our present carriages. They are carriages which I think could be used with advantage in this country.

14,635. (*Mr. Hamilton.*) More on the side of comfort than safety?—On the side of comfort more particularly, but safety in some respects, as in the case of outrage and robbery.

14,636. (*Sir R. Hill.*) You were speaking some time ago of the gains which ensued from the construction of railways. Have you had occasion at any time to consider to what extent the value of land and other property has been enhanced by the construction of railways?—I have considered it as matter of general observation and general knowledge as being connected with railways. Land has improved in value by having railway communication. It is very difficult indeed to form an opinion as to the extent of improvement, but that it has greatly improved I have no doubt.

14,637. Can you give any idea of the extent to which that improvement reaches on each side of the railway?—It is very difficult to give any rule as to the extent to which the improvement has reached, because that question depends very much upon the previous modes of communication which existed in the particular district; for instance, a large agricultural district which had bad roads, no canals, and so on, would be improved to a much wider and greater extent by a railway passing through it than a country which happened to have a canal and good turnpike roads. It is almost impossible to lay down any rule upon the point.

14,638. You can give some rough estimate of it?—It depends so much upon the produce and the communication which the country possesses before that I cannot do so.

14,639. (*Mr. Hamilton.*) And also the distance that the land will be from the station?—Yes, and also on the special characteristics of the land, whether it is a mountainous district or not. For instance, if it went through a flat agricultural district, a railway might benefit the country for many miles; but if it passed through a mountainous district, it would benefit it to a smaller extent.

14,640. (*Sir R. Hill.*) But still all these matters are reducible to an average; can you not give some idea of what that average is?—I should not like to commit myself to figures upon such a point, because it requires an amount of investigation which I have had scarcely time to make.

14,641. But a considerable addition has been made to the value of land, quarries, and buildings in many instances?—No doubt, a very large addition.

14,642. Have you ever seen any attempts made to estimate that increased value?—I have heard it put at 10 per cent., 12 per cent., and 15 per cent.

14,643. (*Earl of Belmore.*) Every case must stand upon its own merits?—Yes.

14,644. (*Mr. Horsfall.*) Of course there have been cases where property has been injured, and the com-

J. Hawkshaw, Esq.

13 Mar. 1866.

pany has had to pay compensation ?—There are cases in which building ground has been damaged ; and on the other hand there are cases where land has been converted into four times its value by enabling it to be laid out as villa property. That has occurred frequently in the suburbs of London.

14,645. (*Sir R. Hill.*) Suppose the line to run through purely agricultural land, what do you say would be the probable addition which would be made to the value of that land ?—It depends on the nature of the district. As I have stated, five or six miles in a purely agricultural district might be increased in value. Of course the further off the line the less would be the benefit.

14,646. (*Chairman.*) You can suggest no point on which you think it would be desirable for Parliament to interfere with respect to railways by any general measures ?—There is nothing that occurs to me where they could do good by interfering ; I have heard various plans suggested, but I must confess none of them appear to me to lead to any good result.

14,647. (*Mr. Horsfall.*) Did you see the Railway Companies' Bill of last session, which was withdrawn by the Government ?—No. I do not remember that I did.

14,648. (*Mr. Hamilton.*) Do you think the time has arrived for altering the maximum rates, which is a power reserved by Parliament ?—No. My impression is that if you struck out all the maximum rates altogether it would not affect the question in the slightest degree. I do not think they are of any use.

14,649. It has also been suggested, in order to remove the complaints made in particular localities, that a minimum rate should be fixed as well as a maximum ?—I think a minimum rate would be absurd. In fact, it is my opinion, that if you struck out the rate clauses altogether it would not affect the question. I think a maximum rate signifies nothing, nor that the tables of tolls signify much ; as to providing a minimum rate, it would be positively mischievous. If I were to recommend Parliament to do anything, I would recommend it to do this. I would strike out all rate clauses. But with a plain intimation that railways would be sanctioned wherever found necessary. I believe if that were done, it would be a better safeguard as respects the public than anything else which could be done.

14,650. You say wherever they were found necessary ; do you mean wherever the present lines did not afford sufficient accommodation ? — Wherever there was a want of accommodation. If it were to be understood that parties who were willing to afford it, if they came to Parliament, should get permission, provided they did not do any wanton damage to property, or any damage that could be avoided by some other mode of dealing with it, I should say let them have their Bill.

14,651. What would be the effect of such a change as that on railway property ; would it be to enhance it or lower it ?—I am not sure that it would affect its value. It would not affect its value in my judgment. I should hold railway property then with as much faith in its security as I hold it at present. I think that companies have rested on having as they thought a monopoly, and in many cases that has led them to neglect doing what they ought to do, such as making branches, or attending to complaints which they would have done had they been aware that they had not such a monopoly. As regards the public, I think it would have a salutary effect. I do not put money into railways on the supposition that if some other district wants a railway, and can get anybody to make it, that they will not be allowed to make it. I am one of those who believe that all the existing railways in the course of a few years will be so choked with traffic that before long you will be compelled to authorize railways to be made on some of the leading lines for the carriage of passengers only, and that the public will not be content to run the gauntlet through goods trains, coal trains, and cattle trains. I think we shall be compelled to make railways to carry passengers only.

14,652. (*Chairman.*) You think an enactment as to the scale of tolls and maximum charges is of very little benefit to the public ?—I say, if it were an understood principle that railways were like manufactures, and that if any person who chose to find the money, and could show that a district wanted railway accommodation, were allowed to make it, then I do not think that a scale of tolls would signify ; you must take both propositions together.

14,653. (*Mr. Hamilton.*) That not being the case, you would not think it desirable that the maximum should remain ?—I mean to put it in this way ; if you treat railways as you treat mills.

14,654. (*Chairman.*) Did you ever hear of a person building a mill and not intending to work it, but merely for the sake of making himself troublesome to his neighbours, and with a view of compelling them to buy it ?—Never.

14,655. Is not that the case with lines of railway that there are projectors who have no intention of working the railways, only intending to make them troublesome to their neighbours in order to compel them to purchase them ?—But still the people who do that must take care that the thing they make is worth buying.

14,656. Have they not considerable confidence that old established companies would be so afraid of the possible effects that they would give more than the new concern is really worth ?—I do not think that often happens in practice, because I have known many cases where companies have sold their lines, and have lost half their money ; they have sold them to pay 2 per cent. or $2\frac{1}{2}$ per cent.

14,657. (*Sir R. Hill.*) Has not the company which purchased often lost a good deal ?—In many cases, no doubt. There are few persons who would make a railway unless there is some probability of the railway paying. There are exceptions, but the exceptions are not very numerous.

14,658. (*Mr. Hamilton.*) You would not like to see any increased restraint put upon the extension of railways ?—I should not.

14,659. You would sooner leave that question to adjust itself ?—I think it will not be for the public interest to place restrictions upon the construction of railways. In the first place, it would have the effect of causing money to be invested in other countries which had better be invested here. I know of no greater mistake than to suppose, as I believe is supposed by a great many members of the Legislature, that by stopping railways they can prevent money being expended in works of that class. The fact is, that there are gentlemen who will expend their money in things of this sort, and if they do not expend it in this country will expend it elsewhere. They have a fancy for railroads and public works, and therefore if you will not let them invest their money here in public works in England they will invest it abroad.

14,660. That only applies to *bonâ fide* schemes, does it not ?—I think so, as a rule ; I do not think many will find money for schemes that are not *bonâ fide*.

14,661. They may see their way to an immediate return by exercising pressure on other parties ?—I have no doubt that applies to some, but not as a general rule. It is a dangerous thing to rely upon pressure upon other parties, because other parties can generally wait longer than the applicants. I do not think, as a rule, that that is the motive.

The witness withdrew.

Adjourned till Thursday next at 12 o'clock.

Thursday, 15th March 1866.

PRESENT:

The Right Hon. The Earl of Belmore.	Sir Rowland Hill, K.C.B., F.R.S.
The Right Hon. Lord Stanley, M.P., F.R.S.	T. B. Horsfall, Esq., M.P.
The Hon. E. F. Leveson Gower, M.P.	William Pole, F.R.S., *Secretary.*

His Grace THE DUKE OF DEVONSHIRE, K.G., F.R.S., in the Chair.

Charles Edward Stewart, Esq., examined.

C. E. Stewart, Esq.

15 Mar. 1866.

14,662. (*Chairman.*) I believe you were secretary to the London and North-western Railway Company for near 20 years?—I was.

14,663. You have never been connected with other railway companies?—That is the only railway company I have ever been connected with. I may state that I ceased to be secretary to the North-western from the commencement of this year.

14,664. You have paid some attention to French railways?—I accompanied a deputation from the North-western Board in the latter end of 1863, for the purpose of inspecting some of the principal stations in Paris and Marseilles. The visit was a very hurried one, but we were received very courteously and frankly by the railway authorities, and everything was freely thrown open to us.

14,665. Will you be so good as to state the results you arrived at from your examination of the French railways?—With respect to the passenger question, the conclusion at which I arrived was that first and second-class passengers in England, availing themselves of the through fast trains for long distances, are carried at a higher speed and at about the same fares (regard being had to the charge for luggage which is made in France, and the fact that return tickets are not generally issued there); but in France, persons travelling by the ordinary second and third-class trains are carried at a lower rate than in England, and by more frequent trains, especially the third class.

14,666. With respect to the first class, what are the disadvantages under which they labour in France?—The trains are much slower than they are in England; for instance, the speed of the French express trains, by which we travelled to Paris, was 33 miles per hour, making good about 29 miles as against the ordinary speed of express trains of this country, which is about 38 miles. We, of course, have faster express trains to Scotland and Ireland, but, taking the ordinary speed of express trains in this country, it is about 40 miles per hour, as against 33 miles in France.

14,667. (*Earl of Belmore.*) Does the speed of 33 miles include all the stoppages?—No.

14,668. Between Paris and Marseilles?—No; including the stoppages, we made good there about 33 miles per hour.

14,669. (*Mr. Horsfall.*) The express trains of this country make good about 38 miles per hour?—The average speed of our express trains is 38 miles per hour, say from London to Manchester; but to Scotland it is more, it is 42 miles per hour to Scotland, and 41½ per hour to Ireland, excluding stoppages.

14,670. (*Sir R. Hill.*) Are the stoppages as frequent upon the French railways as upon ours?—More frequent, especially on the Marseilles railway.

14,671. Perhaps on some of them the stoppages are more numerous?—Yes; but there was only one stoppage of unusual length between Paris and Marseilles, which is a distance of 500 and odd miles, of about 20 minutes or half an hour.

14,672. Then if the stoppages are more frequent that would account for the less total speed?—Yes, it reduces it by nearly four miles an hour.

14,673. (*Chairman.*) I understand you to state that the actual speed, when the train is in motion, is considerably less?—Yes.

14,674. (*Mr. Horsfall.*) What amount of luggage do they allow a passenger in France as compared with a passenger in England?—In England they allow 112 lbs. to a first-class passenger, 100 lbs. to a second-class passenger, and 56 lbs. to a third-class passenger. In France they allow 60 lbs. irrespective of class.

14,675. (*Chairman.*) In France the second and third class passengers are considerably better off than in England, are they not?—Yes, I consider so as respects short distances and single journeys.

14,676. Will you state the particulars in which those classes possess advantages in France as compared with England?—I have taken two of the French railways and two of the English railways as specimens, the North-western and the Manchester, Sheffield, and Lincolnshire, and I find that this would be the result:—Passengers travelling by the London and North-western from London to Leighton, and by the Manchester, Sheffield, and Lincolnshire railway from Manchester to Sheffield, or by the Paris and Mediterranean from Lyons to St. Rambert, or Lyons to Macon, are supplied with train accommodation and charge as follows:—From London to Leighton, which is a distance of 40½ miles, there were 10 first-class trains, allowing 112 lbs. of luggage, at 7*s.* 2*d.*; 10 second-class trains, allowing 100 lbs. of luggage, at 4*s.* 8*d.*; and one third-class train, allowing 56 lbs. of luggage, at 3*s.* 5½*d.* On the Manchester, Sheffield, and Lincolnshire line, from Manchester to Sheffield, which is a distance of 41¼ miles, there were seven first-class trains, allowing 112 lbs. of luggage, at a fare of 9*s.*; seven second-class trains, allowing 100 lbs. of luggage, at a fare of 6*s.* 3*d.*; two third-class trains, allowing 56 lbs. of luggage, at a fare of 4*s.* 6*d.*; and one Parliamentary train at a fare of 3*s.* 5½*d.* From Lyons to St. Rambert, which is a distance of 37½ miles, there are four first-class trains, allowing 112 lbs. of luggage, at a fare of 6*s.* 6½*d.*; four second-class trains, allowing 100 lbs. of luggage, at a fare of 4*s.* 11¼*d.*; and four third-class trains, allowing 60 lbs. of luggage, at a fare of 3*s.* 3*d.* I have assumed the distances equal, and have added the charge for luggage, bringing them up to the English standard. They can travel, therefore, in France four times by third-class for 3*s.* 3*d.*, as against once by the North-western for 3*s.* 5½*d.*, and three times by the Manchester, Sheffield, and Lincolnshire for 4*s.* 6*d.* and 3*s.* 5½*d.*, as against 3*s.* 3½*d.*; so that, compared with the fares on the English lines, and adding the charge for extra luggage (52 lbs.), the first-class passenger in France pays 7½*d.* less for the 41¼ miles than on the London and North-western, and 2*s.* 5½*d.* less than on the Manchester, Sheffield, and Lincolnshire line. The second-class passenger in France, adding the charge for extra luggage (40 lbs.), pays 3¼*d.* more than on the London and North-western, but 1*s.* 3¼*d.* less than on the Manchester, Sheffield, and Lincolnshire. The third-class passenger in France, with the right of carrying 60 lbs. of luggage as against 56 lbs. on the English lines, may travel from Lyons to St. Rambert by four trains per day, and from Lyons to Macon by eight trains per day, for 3*s.* 3*d.*, or 2½*d.* less than the Parliamentary fare on the English lines, and 1*s.* 3*d.* less than the ordinary third-class on the Manchester, Sheffield, and Lincolnshire line.

14,677. (*Sir R. Hill.*) That represented the state of things at the time of your visit?—That was the state of things at the time of my visit. I have not looked to see what change has taken place.

14,678. Have you looked to see whether there has been any material change since, either in France or here?—I do not think there has been any material change.

14,679. That was in 1863, was it not?—Yes, the latter end of 1863.

14,680. (*Mr. Horsfall.*) The second-class carriages are also more commodious, are they not, that is, better fitted up?—I do not think they are better than our more recent carriages. I think the new second-class

C. E. Stewart, Esq.

15 Mar. 1866.

carriages on the Great Northern and North-western are quite equal to those of France.

14,681. Are they equal in the internal arrangements?—I think so. I got out of the first-class carriage and travelled in a second class, and I did not find that there was much superiority in the French second-class carriages over the English.

14,682. (*Chairman.*) How are the third-class carriages in France as compared with those in England?—I did not observe the third-class carriages.

14,683. (*Sir R. Hill.*) When you compare the fares, you say they are lower in France than in England for the second and third class, do you take into account our return tickets?—No; my remarks apply to single journeys.

14,684. Have they any similar arrangement in France?—Not generally.

14,685. Taking all matters into account, should you say their fares are lower in France than the English fares?—No, I should not, to those people who can avail themselves of a return ticket, but I add the extra charge for luggage to the French charge.

14,686. (*Mr. Gower.*) What is the extra charge for luggage on the continent?—They charge according to distance. For 41 miles it amounts on the first class to 7½*d.* and on the second class to 6*d.*

14,687. (*Sir R. Hill.*) I think, if I followed you correctly, that you have taken in each class the maximum amount of luggage?—Yes.

14,688. That would be rather unfair towards the French railways, would it not?—Very little; it is not a material item. Then I have compared the number of trains between some of the points. In England of course there are duplicate lines of railway, but I have taken one route only, London to Glasgow, London to Aberdeen, Tring to Rugby, London to Leighton, Paris to Marseilles, Melun to Larache, Lyons to Macon, and Lyons to St. Rambert. There are four communications from London to Glasgow, which is a distance of 406½ miles. The third-class passengers are carried by a fast train at 9 p.m. There is no third-class train goes through. There are three fast trains advertised from London to Aberdeen, which is a distance of 542¼ miles. The third class are conveyed by one of those. From Tring to Rugby, which is a distance of 51 miles, there are seven communications a day. From London to Leighton, which is a distance of 40½ miles, there are 11 communications per day. From Peterborough to Doncaster, which is a distance of 80 miles, there are eight communications, of which three are third class, four are fast, and one is ordinary. From Paris to Marseilles, which is a distance of 538 miles, there are six trains, namely, three fast, one ordinary, and two third class per day. From Melun to Larache, a distance of 70 miles, there are eight trains per day. From Lyons to Macon, a distance of 45 miles, there are 12 trains per day, consisting of three fast, one ordinary, and eight third class. From Lyons to St. Rambert, a distance of 37½ miles, there are eight trains per day, consisting of three fast, one ordinary, and four third class. These facts lead me to the conclusion that the French, as a rule, give more frequent means of intercommunication to the third class between the stations upon their railways than we do.

14,689. (*Mr. Horsfall.*) Do you know at what speed the second and third class carriages travel in this country, as compared with those of France?—I have endeavoured to draw a fair comparison, but it is very difficult to do so. The average speed of the express train from Boulogne to Paris, including stoppages, is 28⅔ miles per hour; while the speed of the third-class trains, including stoppages, is 21¾ miles per hour. From Paris to Marseilles the speed of the express train, including stoppages, is 33 miles per hour; the speed of the ordinary trains, including stoppages, is 22 miles per hour; and the speed of the third-class trains, including stoppages, is 20 miles per hour. From Paris to Montereau the average speed of the third-class train, including stoppages, is 18⅓ miles per hour, and from Paris to Macon 18¼ miles per hour. From Lyons to Tarascon the average speed of the third-class trains, including stoppages, is 18¼ miles per hour. From Lyons to St. Rambert the average speed of the third-class trains is 16¼ miles per hour. From London to Manchester the average speed of the express train, including stoppages, is 38¼ miles per hour, as against 28⅔ miles per hour from Boulogne to Paris, and 33 miles per hour from Paris to Marseilles. The speed between Calais and Paris is somewhat higher, 35 miles per hour. The speed of the ordinary train, including stoppages, between London and Manchester is 32½ miles per hour, as against 22 miles per hour between Paris and Marseilles. The speed of the third-class trains, including stoppages, between London and Manchester is 22½ miles per hour, as against 21¾ miles per hour between Boulogne and Paris. The speed of the third-class train, including stoppages, from Rugby to London on the North-western is 21½ miles per hour; from Chester to Holyhead 22 miles per hour; from London to Watford 20 miles per hour; from Stafford to Crewe 20¾ miles per hour; and between Crewe and Manchester 20¾ miles per hour. The speed of the third-class trains seems to be about the same in both countries; but we are far in advance of them with respect to the first and second.

14,690. (*Sir R. Hill.*) I think you gave the speed of the quick trains between Boulogne and Paris at 28¾ miles per hour?—Yes.

14,691. Are you aware of the speed of the quick trains between London and Dover?—It is about 40 miles per hour.

14,692. Do you know the speed of the night mail, including stoppages?—No; my impression is that it travels about 44 miles per hour. We are far in advance of France, especially with the express and exceptional trains.

14,693. (*Chairman.*) I did not clearly understand what you stated about third-class passengers between Glasgow and Aberdeen. Do I understand you to say that they are obliged to travel in second-class carriages? No; they are carried at third-class fares by the fast train at 9 o'clock.

14,694. At low rates?—Yes; there is no third-class train that professes to go through. They are booked through by the 9 o'clock train.

14,695. Though it may not be by way of being a third-class train, they do carry third-class passengers if they wish to travel by it?—Yes, and in that respect they have a great advantage over third-class passengers in France travelling a long distance. On the continent I do not suppose they would allow a third-class passenger to travel by their express trains.

14,696. (*Sir R. Hill.*) Does the 9 o'clock train carry third-class passengers?—Yes.

14,697. That is a night train?—Yes.

14,698. Do they carry the third-class passengers by that train at the same fares every night?—Yes. "Third-" class passengers are conveyed by the 9 p.m. fast " train " is the note that I have made.

14,699. (*Chairman.*) Do I gather correctly from your evidence that there is, in fact, a greater amount of accommodation on French railways than there is on the English by reason of there being a larger number of trains?—Between intermediate stations, and stations which are a short distance from each other, certainly. With regard to stations a long distance apart perhaps we may afford equal, if not superior, accommodation in the way that has just been described, by allowing passengers to travel by fast trains at third-class rates.

14,700. (*Mr. Gower.*) Do you know if there is any fast train between Lyons and Marseilles that leaves Marseilles later than half-past 5 o'clock in the morning?—I cannot say.

14,701. (*Chairman.*) Did you make any observations with respect to the goods traffic in France?—They are far longer than us in delivery. We found they were allowed, and I believe they availed themselves of the power, a day for collection, a day for loading, and a day for travelling each 100 miles. They then had a day for unloading and a day for delivery, and in the case of heavy or bulky and troublesome articles, they

had two days. So that from London to Birmingham, according to that system, the time allowed for goods traffic would be about five days, and from Liverpool to London six days.

14,702. (*Sir R. Hill.*) Do they actually take that time?—Yes.

14,703. Do you happen to recollect what time the broad-wheeled waggons took between London and Birmingham?—About three days.

14,704. (*Chairman.*) How are the charges in France compared with those of England?—I do not feel competent to speak on that point, but they have a different mode of carrying the lighter goods; they carry them by the passenger trains; but they are quite the exception.

14,705. (*Mr. Horsfall.*) Do they make terminal charges?—That I do not know.

14,706. (*Mr. Gower.*) Is there not a distinction made between certain articles, some of which are carried by the passenger trains and some by the regular goods trains?—Yes.

14,707. Do you not think that that distinction ought to be introduced into the English railways?—It is practically; there are van rates. Light goods are carried by passenger trains now.

14,708. (*Sir R. Hill.*) At a higher rate of charge?—At a higher rate of charge. Those charges must be regulated from time to time by the managers. You cannot lay down any rule. What the traffic will bear the manager will put upon it.

14,709. (*Chairman.*) Have you any information respecting the mineral traffic in France?—No. We were informed generally that they carry at a low rate of speed very heavy train loads with large engines; and we thought their charges moderate; but it is very difficult to compare the charges made. Certain items are included under one head in France, but the railway companies in this country make up their accounts so different that it is very difficult to form a comparison of their charges.

14,710. (*Sir R. Hill.*) The Government have lent great aid to the French railways, have they not?—Yes.

14,711. Do you know whether their charges for goods are more uniform for a certain number of miles than in England?—I do not know. We found that the conditions under which railways are established and worked in France differ so materially from those that exist in this country that it was not possible, generally speaking, to form any comparison with advantage between the two systems. They were totally different. One represents a system of unrestricted competition, leading occasionally to very great inconvenience and injustice to individuals; carried on, as respects current transactions, without regard to commercial principle, and too often with a view only to effect a settlement with a competitor; producing disturbance and much inconvenience to the general traffic, and also serious injury to individuals, localities, and ports. In France they have a system based on monopoly, regulated by the State with a view to the general interest and to the avoidance of those evils; a system, in fact, under which practical effect is given to the intentions of Cardwell's Act. It would not be possible, I believe, even it were thought desirable in the interest of railway proprietors, to apply to the railways of this country the stringent regulations which obtain in France, but it appears to me deserving of serious consideration whether it would not be for the public advantage that some check should be placed upon the great evils that result from those reckless competitions that take place in this country between railway companies.

14,712. (*Mr. Horsfall.*) That competition is sometimes attended with advantage to the public, is it not?—Certainly. No doubt, amidst all the evils of our system, a great deal of good has in many respects resulted from violent competition.

14,713. (*Earl of Belmore.*) Does not the State exercise a direct control over railway companies in France?—Yes; we put this question to one of the managing directors, that, supposing upon the occasion of a *fête* in Paris, and they wanted to make very low rates, could they do so? The answer was that they would have no difficulty, because they would get by return of post the permission of the minister to make any necessary alteration whatever. But when we put the question to him, supposing a difficulty arose at Lyons, or beyond Lyons, between two companies, and they were to quote very low rates, say from Paris, he told us that the minister would not sanction that proceeding, because he would not think it for the public good that there should be such a disturbance, for instance, that there should be a 5*s.* rate to a point, say 200 miles from Paris, and a 30*s.* rate to a point 150 miles from Paris. The minister would not sanction that; it would lead to a temporary competition, which would end of course in loss to all parties and disturbance, and an ultimate combination and impoverishment of both.

14,714. (*Lord Stanley.*) Do you mean that he would prevent a railway company reducing its fares below a certain amount in order to compete with another company?—Yes.

14,715. (*Sir R. Hill.*) Are all the railway fares regulated by the minister in France?—I think they are, especially on those lines for which the Government are responsible in any way. There are several railways for which they are not responsible, but we were told that the minister had used his good offices to prevent their quarrelling and getting into a state of war with one another; and in fact on one occasion they owed it to the minister's good offices that they had not reached that unfortunate result.

14,716. Then in case of any difference they submit their differences to the minister?—Yes; but they are so much under the management of the State that the points of difference are very unfrequent. They do not come in contact with another railway, as they do here, every 20 miles.

14,717. (*Mr. Gower.*) Does the water competition lower the rates of the French railways?—We did not inquire into that. We had only four or five days altogether to visit Paris and Marseilles, and therefore it was a very hasty visit.

14,718. (*Chairman.*) Do any of the French railways belong to the Government?—They guarantee them.

14,719. (*Sir R. Hill.*) They have a reversionary interest in all of them, have they not?—In nearly all.

14,720. (*Earl of Belmore.*) Are there any railways in France over which the Government do not exercise any control?—Yes, they told us of several, giving us instances of the intervention of the minister, in which, although he had not the power of preventing their quarrelling, he lent his good offices to endeavour to do so.

14,721. (*Sir R. Hill.*) I believe the French railways pay, on the whole, very much better than ours do?—The original railways do; but those that have been constructed recently, we were informed were likely to be a very great burden on the Government.

14,722. (*Lord Stanley.*) They are very long, are they not?—Yes, some of them are very long, but they are not main trunk lines like the original railways.

14,723. (*Chairman.*) Those that have been more recently constructed go through less populous and wealthy districts than the original railways?—Yes.

14,724. (*Sir R. Hill.*) Those are the railways which have been guaranteed by the Government?—Yes, and the trunk lines too.

14,725. (*Mr. Horsfall.*) Are any of the railways entirely in the possession of the Government?—No, they do not work them; they merely exercise a control over them. The boards of management are very similar to the boards of the great railways in this country. Their internal arrangements are much upon the same model as the internal arrangements of the railways in this country. In fact it is quite clear from their forms that they had taken those of the Grand Junction and the London and Birmingham.

14,726. (*Chairman.*) What is your opinion on the question of railway monopoly, do you think that the establishment of railway monopoly, if it were practicable, would be desirable?—No, I do not think it would be

C. E. Stewart, Esq.

15 Mar. 1866.

desirable, either in the interest of the public or in the interest of the shareholders. I believe that a certain amount of competition is very desirable in this country in railways as well as other things, but to maintain that competition, and make it at all permanent, it must be moderated. Where it is so direct and intense as it must be between two railways having a reasonably good communication between A. and B., they will not go on competing in that intense way. They will come together and say, that the time has arrived for putting their horses together.

14,727. What is the course that matters practically take when two railway companies have competing lines between two different points?—They meet to endeavour to divide the traffic, and they very often differ about that; certainly they always did in the early days. The first effect of violent competition used to be to lessen the accommodation at the intermediate points. The number of express trains between the important points increased, to the sacrifice of intermediate stations. The rates were quoted very low from the more important points, and after a time the parties agreed to a restoration of the rates, and then, after both becoming impoverished, they reverted very much to the state of things that existed before.

14,728. When fares are ultimately settled, are they generally fixed at a higher or a lower point than those which previously existed?—In some cases the fares are even a little higher; between Manchester and London the first and second class fares I think are lower than they previously were. But between Birmingham and London they are the same, and I believe the only deviation that has taken place was to raise them slightly.

14,729. (*Sir R. Hill.*) The same as before the competition commenced?—Yes. The passenger fares between Staffordshire and London were never lowered. I had occasion to give evidence upon that point; I have referred to the minutes, and I have ascertained that they were in one or two classes actually a little higher than before the competition commenced.

14,730. Did not competition lead to the abandonment of the higher charges by the express trains?—No. The North-western have abandoned the express charge throughout their whole system. It was not in reference to any particular point, but they simplified their charges, they found it so inconvenient. People re-booked, and it was so inconvenient that we abandoned it entirely. I think Chester is almost the only place to which we have an express fare, and that is by the Irish mail. The object of that really is to keep it as select as possible.

14,731. In abandoning the additional charge by the express trains, did you adopt a mean between the two, or did you lower all the charges to those previously made by the ordinary trains?—I believe it was simply an abandonment of the express fares.

14,732. Has the company been satisfied with the results of that partial lowering of their charges?—It is difficult to answer that. I think that is a mixed question. It has rendered the express trains less select and less punctual than they otherwise would be. I think there is a large class of people who might very fairly complain of the alteration, who say they would be very willing to pay a higher fare for a better service. In some cases it has rendered the express trains unwieldy. Delay takes place at the stations and junctions; but, on the whole, I should say the public have derived advantage, and the railway company has not suffered damage.

14,733. You continued the higher charge in respect of some of the mail trains?—Yes; I think to Chester by the Irish express.

14,734. Do not the higher fares apply to the Scotch mails?—No; my impression was that they had, but some months ago I had occasion to inquire into this question, and I was rather surprised to find that it was not so.

14,735. (*Mr. Horsfall.*) You spoke just now of the fares from Staffordshire to London never being lower than they are at present?—Yes.

14,736. Is that the case with regard to goods traffic?—I do not know; I do not feel competent to speak on the goods question. That has not come within my cognizance.

14,737. (*Chairman.*) What advantage has the public derived from having two lines between two important points, if the fares are the same as they were when there was only one line?—If the trains started at different hours, there is a certain convenience to the public, especially in a great city like London; but I think it will be found that, as a rule, they start at the same hour, and therefore that advantage is to a great extent obliterated. The Great Northern train for Manchester starts at five o'clock, and so does the North-western train.

14,738. But you consider that the public does derive advantages from having two different lines between those points?—Yes, in some respects, although I doubt whether, on the balance, they do; but they derive a certain advantage where the trains start at different hours.

14,739. But otherwise you confine the advantages that they derive simply to that point?—Yes; and there is a certain competition in accommodation.

14,740. (*Mr. Horsfall.*) Of course those lines pass through different localities, and therefore they must be of great advantage to the intermediate stations?—Yes; but if they were not competing for those more valuable distant points, they would accommodate those intermediate stations better. Of course it is very difficult to analyse it, but I believe if you were to inquire you will find that there are very many points between Birmingham and London, and between Manchester and London, both on the North-western and the Great Northern, and the Manchester, Sheffield, and Lincolnshire lines, that probably were better accommodated before the violent competition between Manchester and London than during that violent competition.

14,741. You confine those remarks to extreme distances?—Yes, and the intermediate points. So long as those valuable points like Birmingham, Manchester, Liverpool, and London are objects of contention between railway companies, they sacrifice the intermediate points. They have got them in their hands. Perhaps they lose a little, but they gain more by struggling for the most distant points.

14,742. Do you think the intermediate traffic is developed as much as it might be if greater accommodation were given?—No, I think not. I think the intermediate traffic would be developed to a much greater extent if there were less violent competition between the extreme points.

14,743. (*Sir R. Hill.*) The convenience of the intermediate places is sacrificed for the sake of competing as regards remote places?—I think that is the tendency, and the more intense the competition the more does that tendency show itself.

14,744. Does that sacrifice of the convenience of intermediate places continue after companies have come to an understanding as to the charges which are to be made to the more remote places?—The effect, I believe, is to mitigate it, but still they never feel entire confidence in those "honourable understandings" into which they enter.

14,745. (*Chairman.*) Do you not suppose that railway companies consult their own interests in making their arrangements merely for the traffic between the important points, rather than consult the interests of the intermediate places?—The railway companies consult what they conceive to be their interests in that and in all other cases, and when witnesses come to Parliament and say they do not, and are consulting the public interests, I never believe them. That leads me to say that I believe if Parliament were to legislate with reference to what railway companies have done for the public requirements, rather than what promoters promise to do if they get their powers, that the public would be better off than they are now.

14,746. Are you of opinion that free trade, in the ordinary sense of the word, is practicable as applied to the railway system?—No, for it is impossible that all the railway companies should have their separate stations, or their separate entrances, or even their separate lines

into large towns, and yet it is a very desirable thing that railway companies, especially the large systems, should be universal, and that they should have communication from all points on their line to all other important places. That can only be done by duplicating the lines or making arrangements among themselves. If they were encouraged to make those arrangements in a friendly spirit, I believe very great advantages would result to the public. You cannot compel them to trade with one another on commercial principles by hostile legislation; they will not do it. There is a feeling of doubt engendered which prevents that free intercommunication and co-operation which is very desirable in the public interests. The state of antagonism into which the railway system has been thrown, and the distrust they have of each other, and especially of Parliament, is, I believe, a great misfortune.

14,747. (*Sir R. Hill.*) When did that feeling of mistrust commence?—I cannot say; it has been in existence as long as I can recollect.

14,748. In the early history of railways there was not that competition to which you refer, because Parliament discouraged competition, did it not?—Yes; but my connexion with railways has not extended beyond 1847, at which time competition was in existence and very freely discussed. On that subject I may state that, fifteen years ago, having had occasion to consider this question, I advised a revision of rates upon the North-western line at all points, irrespective of the existence of competing railways. I have continued to advocate that view; but people who took a different view, asked, What advantage is there; Parliament does not take that into consideration; Parliament will show us no more consideration for this than if we keep up the high rates and get them as long as we can.

14,749. (*Chairman.*) Can you state to what extent you advised a revision of rates?—It was in 1851 I advised a revision of rates generally. In the same document I pointed out that competition between railways was an inevitable condition, and recommended that we should make "a general revision of the rates upon our "own line, not with a view to a panic, but to the "removal of cause of complaint at those towns "where, owing to the absence of competition, the rates "had been maintained at a high scale as compared "with neighbouring places."

14,750. (*Sir R. Hill.*) Then you desired to deal with the public in the absence of competition very much as you would be obliged to deal with the public in consequence of competition?—Yes; that was my view.

14,751. (*Chairman.*) That was because you apprehended competition of all sorts to arise?—I apprehended that competition would ultimately be introduced.

14,752. (*Mr. Horsfall.*) Can you state what percentage of reduction you proposed?—No.

14,753. (*Chairman.*) Did you advise a very large reduction both in the passenger fares and in the charges for goods?—I advised the removal of all anomalies, where there were anomalies.

14,754. (*Sir R. Hill.*) Did you advise something like an uniform mileage rate?—No; that I never should have advised.

14,755. You appear not to think that the public has derived any considerable permanent advantage from competition, taking into account the convenience of the smaller towns as well as the convenience of the larger?—The smaller towns I believe have suffered, as I said before, but on the whole advantage has I think resulted from competition. It has called forth the energies of the men engaged in the conduct of our railways in a way that I do not think they would have been called forth under any other system. It has cost a great deal of money, probably 100,000,000*l.* You cannot recal the 100,000,000*l.* or whatever has been the amount spent beyond what was necessary to give an equal amount of accommodation to what you have got now; but there is an evil going on now of equal magnitude, and that is the enhanced expense at which the traffic of the country is worked by reason of the want of co-operation between the railway companies in the running of unnecessary and in many cases duplicate trains without any corresponding advantage to the public; in fact, on the contrary, as I endeavoured to explain before, I believe that, on the whole, the balance is against both the public and the shareholders, for although the terminal points may appear to get an increase of accommodation, the intermediate points have suffered in a greater degree.

14,756. Suppose competition had not been allowed by the Legislature, one result, I presume, would have been that a much larger amount of traffic would have been enjoyed by the old lines, the North-western for instance?—No doubt the North-western and the other old lines would have been in a very much better position than they are now, and their shareholders would have been anxious to have had an extended railway system, instead of being, as they too frequently have been, averse to doing so, as was the case with the Midland shareholders when their dividends were small. All shareholders, when their dividends fall, get dissatisfied. Their first cry is to stop the expenditure, and then there come in contractors who supply the accommodation required by the public, but in a much more costly, and, I believe, a less beneficial manner than would have been provided by the same amount of capital if expended by one of the old companies, especially in co-operation with their neighbours. Two of the great companies expending a few hundred thousand pounds can give the public much more accommodation than ten times that amount of money spent independently and in a state of hostility to the existing companies.

14,757. If the old companies had enjoyed that amount of traffic which they now have to share with new companies, it would have been in the power of those companies, would it not, to have reduced their charges very considerably?—If Parliament had adopted this policy, for instance, that with an increase of dividend there should be a reduction in the tariff of charges, it would I believe have been very beneficial. A company receives its Act with a certain set of tolls, but with its advancing prosperity, I think those tolls might be reduced.

14,758. By "tolls" you mean fares?—By tolls I mean their power of charge to the public.

14,759. But setting aside for a moment the question of interference on the part of the Legislature, if the old companies had enjoyed the whole traffic instead of having to divide it with competing lines, would they not have had the power of making a considerable reduction in their rates?—They would have been in a position to do so.

14,760. Then as regards motive, have not the companies found by experience that moderate charges are more profitable than the high rates which were charged 20 or 30 years ago?—Under certain circumstances, yes. When there is a large mass of traffic to be dealt with, we have found that a very low rate of charge induces a great development of traffic; in the manufacturing districts, for instance, where the population is dense. Then, again, we tried a very low rate of charge in Buckinghamshire, but you cannot move agricultural labourers, and indeed if you offered to carry them for nothing they will not go.

14,761. But under certain circumstances favourable to traffic the company have found by experience that moderate charges are more profitable than high charges?—Yes.

14,762. You are aware, are you not, that in nearly all the Railway Companies Acts there is a provision which authorizes Parliament at any time to reduce the rates irrespective of dividend?—I am not aware of that.

14,763. Is there not in the North-western Act a clause under which Parliament reserves to itself the right of revising the rates at any time?—After payment of a dividend of 10 per cent.?

14,764. Irrespective of dividend?—I am not aware of it, unless the Government elect to purchase the railway on the basis of 25 years purchase.

14,765. (*Mr. Horsfall.*) The principle was laid down in the first Liverpool and Manchester Act, was it not,

C. E. Stewart, Esq.

15 Mar. 1866.

that when the dividend amounted to 10 per cent. a corresponding reduction should take place in the rate? —I have heard of it, but I never saw it.

14,766. That principle has been evaded, has it not? —No. I cannot admit that. Lawyers differ about that, and therefore I would rather not express any opinion.

14,767. (*Sir R. Hill.*) But assuming for a moment that Parliament has the power of revising the rates, then if the old railways had enjoyed the traffic which they now have to divide with the new railways, would it not have been practicable, without reducing the dividends of the old lines below a fair amount, for Parliament to have enacted that they must carry for lower fares?—Yes, it would; but I think the sounder basis would have been to have made it contingent on an increase of dividend.

14,768. Then it does appear, assuming that power to have existed, that the advantage of lower rates might have been given to the public without competition?—I doubt whether there would have been the economy that there now is in working railways if you had not given the railway company a direct and immediate interest in economising its working expenses.

14,769. Are you aware of the existence of this clause in Standing Order No. 167:—"The following clause "shall be inserted in all railway bills passing through "this house: And be it further enacted, that nothing "herein contained shall be deemed or construed to "exempt any railway by this or the said recited Acts, "authorized to be made, from the provisions of any "General Act relating to railways now in force, or "which may hereafter pass during this or any future "Session of Parliament, or from any future revision "or alteration, under the authority of Parliament, of "the maximum rates of fares and charges authorized "by the said Act [or by the said recited Acts]"?—I certainly never understood that there was any power on the part of Parliament to alter the tolls, rates, and charges upon which a railway was originally sanctioned, and upon which the shareholders agreed to subscribe their money, except in the case either of the dividend exceeding 10 per cent., or of the Government electing to purchase the railway.

14,770. It did not, I believe, exist in the older Acts, but was introduced, I think, in 1846?—Yes; but of course the main lines, such as the North-western and others, were sanctioned before that.

14,771. But the North-western has been repeatedly before Parliament since 1846 for modifications of its Act, has it not?—Yes.

14,772. You see then Parliament has reserved a power to reduce the rates of certain lines accordingly? —Yes.

14,773. But it has obtained Acts since 1846 irrespective of the dividends obtained?—Yes.

14,774. Do you not think that Parliament might have exercised that power so as to have afforded to the public all the advantages of low rates without competition?—I come back to the point that I believe the sounder basis would have been to establish an identity of interests between the workers of railways and the public. I do not think you would ever have had the economy that is now exercised in the conduct of the traffic unless you had given the shareholders of the several companies a direct and immediate interest. If you had said, when you get an increase of 1 or 2 per cent. dividend that there should be a reduction of your rates, you would have made it their interest to have economised and gone on decreasing their charges to the public.

14,775. But if the reduction were to depend upon the dividend to the shareholders, would not the effect of such an arrangement be to make it the interest of the shareholders and directors not to bring the dividend up to the maximum?—They would bring it up to the maximum, but they would not exceed it. I understood you to put the case of there being no maximum; but I admit with the maximum of 10 per cent. the Government have the power of purchasing certain railways.

14,776. This clause does not speak of any maximum. I understood you to express an opinion to the effect that it would be better if the Legislature had retained and exercised the power of reducing the rates and charges when the maximum dividend was reached? —Instead of a maximum I would have made the reduction progressive and dependent upon the dividend. I think it was not desirable to say that they should go to a very high maximum without any advantage to the public, but rather that there should be an immediate advantage to the public, and that the identity of interest and contingent reduction of charge should commence, say, about 5 or 6 per cent.

14,777. With such a provision as that, you think it would be better that there should be no competition? —Yes; I very much prefer a mitigated competition to that which has existed. It would have economised capital, and prevented, what is going on now to a frightful extent, waste in the working the traffic.

14,778. Can you now suggest any means by which the further waste of capital would be avoided?—If confidence could be restored between railway companies; when they enter into an agreement for the exchange of specific rights and powers, and exchange of property, on terms which would satisfy a public board as fair and consistent with the public interests, Parliament should respect those agreements. At present the companies find when they come before Parliamentary committees those agreements are looked upon not only with suspicion, but as *primâ facie* evidence that they must be injurious to the public, because they are between two railway companies. One of those parties is permitted to come to Parliament and have agreements made under their seals broken upon no other ground than the allegation that a public advantage would result from the agreement being broken.

14,779. Then you appear to be of opinion that what is wanted is an intermediate authority between Parliament and the companies, a court of appeal, as it were? —You cannot have a court of appeal from Parliament, I am afraid.

14,780. You recollect the measure that was adopted in 1844, I think, of referring all Bills to the Board of Trade?—Yes, that failed.

14,781. Is that the kind of arrangement that you would recommend?—No; I wish for a court of much higher rank. It has appeared to me that a fluctuating tribunal like a Parliamentary committee is a very uncertain and unsatisfactory one, and that you want a much more permanent tribunal. I do not think that the cost of such a permanent tribunal ought to interpose the slightest difficulty. I believe the best tribunal for the management of railways would be in the end the cheapest. There has been a good deal of discussion about the cost of Parliamentary legislation, and suggestions for reducing the hearing from two to one. I believe it would be a great misfortune to reduce the two committees to one. I believe the second hearing generally arrives at a much more correct judgment than the first, and that the cost ought to be a very secondary consideration to obtaining the best judgment that can be obtained. With regard to railway legislation, I would very much prefer seeing a permanent tribunal of the very highest character irrespective of cost.

14,782. To be appointed by Parliament or by the Crown?—By either, but not necessarily to be members of Parliament.

14,783. (*Mr. Horsfall.*) I think you stated just now that you had recommended the North-western Company to make a reduction in their fares?—To anticipate the effects of competition, no specific reduction.

14,784. Do you think that could be done with advantage to the public and without any loss to the company?—I believe so. I believe it would have been done years ago if the company could have had confidence that Parliament would have taken that course into consideration and dealt with them in an equitable spirit; but, on the contrary, there was a total distrust of Parliament. We were met by this unanswerable argument, that Parliament has never given any con-

sideration to what has been done for the public. They have rather taken the promise of some aggressive speculator as to what he would do, and have overlooked everything that had been done before.

14,785. Your opinion then remains the same?—Yes.

14,786. (*Chairman.*) You have stated it as your opinion that there might be a considerable reduction in the cost of working; by what means do you think that reduction could be effected?—I think the number of trains which are run now between the points of competition are greater than are necessary for the public convenience or necessity. I may mention that about five years ago I had to look into this question by the desire of the then chairman of the North-western Company, Admiral Moorsom, and I will now state the conclusions which that inquiry led me to form. I found that of the total working expenses, (49 per cent. of the gross receipts,) 27 per cent. arose under three heads, viz., 9 per cent. under the head of permanent way, 14½ per cent. under the head of locomotive power, and 3½ per cent. under the head of maintenance of coaches and waggons. Any unnecessary running of trains of course had a direct bearing upon the working expenses through those three items. There had existed, and I believe there still exists, in the minds of railway shareholders and even directors an impression that we are suffering from unduly low rates, especially on the heavier description of traffic, and that the greatest benefit would be derived from an advance of rates. I had expressed my belief that the result aimed at was not practicable. I found that the rates were moderate, and the conclusion that I arrived at was that railways were suffering not so much from the lowness of the rates as from the undue cost of working. The attempt to obtain high rates led to a loss of traffic, to the working of what was carried at an excessive cost in the train mileage, to the running of duplicate and empty rolling stock, and of course to wear of way; and I believe that the present and ultimate welfare of railways will depend not so much upon an advance of the rates as upon a saving in the working expenses.

14,787. Do you think that unnecessary goods trains are run as well as passenger trains?—Yes. The general managers will tell you that very often a waggon is sent off with a quarter of a ton or half a ton which is capable of carrying four or five tons. I believe the general average which is sent off in a waggon is not more than from 1½ to 1¾ tons.

14,788. (*Lord Stanley.*) Is that because the persons who send goods by railway are impatient of delay?—Yes; the cost of transferring goods at junctions is so very great, and it is so troublesome, and they are so liable to get wrong and lead to claims, that companies prefer sending off waggons capable of holding four or five tons to small stations with a few hundredweights rather than sending it to a junction to be transferred.

14,789. (*Mr. Gower.*) What is the average capacity of the waggons?—They are capable of carrying four or five tons.

14,790. (*Sir R. Hill.*) Then the waggons are only one-third full on the average?—Yes.

14,791. Is not that arrangement a necessary one to enable the railways to have competition with canal companies, who deliver at small wharves as they go along?—It may be at points which are well accommodated by canals; but I believe the economy to be obtained from the development of all descriptions of traffic in full waggons and full carriages and full train loads at moderate speeds where practicable is enormous.

14,792. (*Chairman.*) Under the present state of circumstances do you think that is attainable?—Not without much more co-operation between railway companies than at present exists. As long as they are in a state of violent competition there will be this absence of co-operation. Whether the advantages which they gain by that are not outweighed by the disadvantages, it is for them to consider.

14,793. (*Sir R. Hill.*) Have the extended amalgamations which have taken place tended at all to reduce that competition?—I have no doubt that they have tended to produce great convenience.

14,794. Suppose all the railway companies in the country were to belong to one company, would you have this system then?—No; but I doubt whether the people would have their goods quite so soon; I quite admit that.

14,795. If all the railways were to belong to one proprietor, whether to a company or the Crown, there would be a tendency to prevent that waste of which you have spoken, would there not?—Certainly; and it appears to me that it is not now so much the competition between railways as a competition between markets, by means of railways, which should be aimed at.

14,796. Causing impatience on the part of the consumer, I suppose?—No. I am speaking now of using railways as a means of bringing markets into competition with each other, rather than making two railways compete, which is a very costly thing, and necessarily only temporary. The quantity of traffic which will bear a high rate of carriage is very limited, viewed in connexion with the enormous capital invested in the railways of this country. The coarser descriptions of merchandise, the cattle and mineral traffic, offer the only field which is capable of great development. The published statistics of passenger traffic show that the third and second class passengers are the only sources which admit of great development. In 10 years, with an addition of 420 miles or 88 per cent. to the line worked by the London and North-western Company, we find an increase in the receipts from first-class passengers of 71,000*l.*, or only 13½ per cent.; from second-class passengers, 202,000*l.*, or 46¼ per cent.; from third-class passengers, 226,000*l.*, or 88¼ per cent., equal, in fact, to the increase in mileage. These broad features have shown themselves year after year. The result is not accidental. Any arrangement tending to stimulate the first-class traffic by inconveniencing and impeding the development of the third must result in a diminution of profit. Then, making the comparison over a more extended period, namely from 1850 to 1864, the result is found to be as follows:—With an increase of mileage of 791 miles, or 166 per cent., there have been an increase of the number of miles run with passenger trains to 5,735,799, or 152 per cent. The total increase of receipt is 952,173*l.*, or only 78 per cent., in the following proportions:—first-class, 210,099*l.*, or 40 per cent.; second-class, 326,355*l.*, or 74 per cent.; third-class, 415,719*l.*, or 162 per cent., again the third-class keeping pace both with the additional mileage worked and with the miles run.

14,797. Do you think the increase upon the third-class is capable of being still further enlarged?—I think so.

14,798. Should you recommend a reduction of second and third class fares?—I think you must leave that to the judgment of the managers of the various railways. Any general reduction I think would not be judicious. The rates are very moderate I think now, and a sweeping general reduction would be attended with great loss at many points, whereas judicious reduction might be attended, as I believe it would be, with compensation and profit, but that would have to be dealt with by the managers.

14,799. (*Mr. Gower.*) The effect of a reduction of fares must depend on local circumstances?—Entirely; we tried the experiment at various places, I recollect, between Shrewsbury and Wellington. Through the violent competition between the North-western and the Great Western, passengers were carried for a penny. The consequence was that everybody travelled, even the boys coming out of school for an hour used to have a pennyworth of railway. The North-western Company's proportion of the receipts increased from 20*l.* or 30*l.* a week to 283*l.* We tried very low rates in Buckinghamshire, but it proved an entire failure, it had not the slightest effect.

14,800. (*Sir R. Hill.*) Do you mean that these penny fares between Wellington and Shrewsbury were very profitable?—No, on the contrary, it developed a large amount of traffic, because people there were disposed

C. E. Stewart, Esq.

15 Mar. 1866.

to travel, and availed themselves of it, but the increased cost exceeded the increased receipt, while in other parts of the country no amount of reduction would induce them to travel.

14,801. But even between Wellington and Shrewsbury, notwithstanding the vast increase of traffic, the net receipts diminished?—Yes, because it had been carried to an extreme, in fact to an absurdity; supposing that you were to reduce the fare between Edinburgh and London, you cannot induce the people to travel more frequently, on account of the time and labour necessary for such a journey.

14,802. (*Mr. Horsfall.*) There have been considerable reductions made in the station masters' salaries on the North-western line, have there not?—Not that I am aware of; some changes have been made no doubt.

14,803. Have they not been charged rent for the station houses?—In many districts the station master lived in the house free, and in another district he was paying rent. In order to simplify the matter in the accounts they have all been charged rent, but as a rule the amount of the rent was added to the salary.

14,804. (*Sir R. Hill.*) You appear to be of opinion that as between places remote from one another a reduction in the charges does not do much to increase the traffic?—Reduction is advantageous at particular seasons of the year, as, for instance, during the summer holidays. You can only induce people to travel in large numbers by very low rates, but that should be done by excursion tickets or special tickets. A general reduction of fares between London and Edinburgh, irrespective of season and circumstances, would mean nothing more nor less than a loss to the railway company.

14,805. Do you think permanent low fares in an agricultural district would be beneficial to railway companies or not?—I think not.

14,806. Do you think the fares at present are as low as can be expected?—I think so; because, as a rule, our experience has shown us that we cannot induce agriculturists to travel more by low fares than they otherwise would.

14,807. Do you think, if matters are left to themselves, that there will be a large increase gradually of the second and third class traffic?—Yes.

14,808. Without any intervention on the part of Parliament?—I think so. I think the managers of railways are becoming alive to the necessity, and must be left as they feel their way to make a reduction wherever they think they will increase their profits by doing so.

14,809. You have spoken of the evils arising from the want of co-operation between railway companies; do you apprehend any evils which are likely to arise from a want of proper arrangement between the companies in forwarding goods and passengers?—I think they arise from a distrust of each other, and a fear of the consequences that would probably follow any concession that they might make to each other, such as admitting people to the use of station and to the use of a line, who are, perhaps, not their competitors, but who may become their competitors from a change of circumstances, and then the very fact of having admitted them once is brought to Parliament and made the groundwork of a hostile application for a compulsory admission to the station for all purposes, involving the company in great inconvenience and increase of expense.

14,810. Does the public suffer any inconvenience from the want of proper arrangements at junctions between two railway companies; is there delay in the forwarding of goods and passengers?—I cannot say that there is more delay than could be justified under the circumstances.

14,811. Does one railway company ever make its arrangements on purpose to inconvenience another?—No doubt that has been the case; but I think it is much less frequent than it was; in fact, I should say it is quite the exception.

14,812. Is there any unwillingness on the part of railway companies to make, among themselves, arrangements for through booking?—I think not. It is very generally adopted now; but there would be very great jealousy to making it compulsory. The North-western, for instance, book through very generally even with competitors; but they would look with great jealousy at being compelled by law to book through under all circumstances. Their protection now is, that if they are treated unfairly by any company with whom they are carrying on a voluntary co-partnership they can cease to book through, and that keeps companies reasonably honest towards each other. I can mention a case which illustrates that. I recollect some 15 years ago we booked through, to a small line, some goods, I think it was cheese, to Cheshire. It so happened that they were not delivered. We wrote to the company. They were in a state of antagonism to us. They would not reply to our letter. An action was brought against us as having made the contract. Fortunately we were able to trace the goods; and when that was discovered by our co-partners they paid the money, but they put the onus upon us. They would not reply to a single communication. That showed us what might be the consequences if by law we were compelled to book through, at the instance of the public, on to the line of a company who were disposed to treat us in that way. We might be involved in very serious inconvenience and loss.

14,813. That was an occurrence which took place some years ago?—Yes.

14,814. Has not the feeling of cordiality between different companies rather improved?—Yes, very much so, and as amalgamations take place, and as companies extend their communications to points of competition and divide the traffic, that feeling will become better.

14,815. (*Earl of Belmore.*) May not the difficulty of compulsory through booking be met by extending liability to the companies with whom you were booking through, in case you were compelled by law to adopt that course?—I am afraid there would be a great difficulty in that. The public only know the company who makes the contract, they take that company to a court of law, and know nothing about anybody else.

14,816. (*Chairman.*) Do you think amalgamation has been carried as far as is desirable for the public advantage?—No, I think not. I think it might with great advantage be carried farther, but it would be well that, where it is ultimately desirable, it should be done while railway companies are in a tolerably prosperous condition, and when Parliament might make terms with them. Hitherto too often they have postponed it until it has become a necessity, for instance, the Shrewsbury lines, after carrying on a violent competition for years, to the great injury of their own system and the adjoining ones, came to Parliament and said, Now we are upon the verge of ruin, you must hand us over to one of the large companies, or we cannot accommodate the district. Parliament sanctioned the amalgamation because they were not in a condition to make terms. It was the same with the West Midland; for years they carried on a contest with the Great Western about their gauge and other things; they projected new lines all over the country to compel the Great Western to buy them, in fact, if I recollect rightly, one of their witnesses described the Oxford and London line very candidly as a "lever" line, a lever to compel the Great Western to buy them. For years this went on, and at last they came to Parliament and said, the time has now arrived, our line is in bad order, we cannot buy any more rolling stock, and unless you hand us over to the Great Western we cannot carry on the traffic. Parliament had no option but to sanction that arrangement. It is true they inserted a clause with reference to the reduction of rates when the profits reached 8 per cent., but that was no advantage to the public. If these amalgamations had taken place before that impoverishment had occurred, Parliament might have made lower rates a condition to their giving their sanction to the arrangement.

14,817. You mean Parliamentary sanction to amalgamation; you do not mean consent?—No, sanction; but Parliament might have withheld its sanction unless

they got reasonable conditions under the circumstances. It is a favour that these companies come to ask at the hands of Parliament.

14,818. (*Sir R. Hill.*) The Great Western Company were willing to purchase the West Midland, and did, in point of fact, purchase it, did they not?—They refused to purchase on certain terms, and then finally, as the least of two evils, they agreed to an amalgamation.

14,819. I suppose the Great Western were influenced in the purchase of the line by the desire of arresting the further mischief of competition?—Clearly; they had stood it session after session, and as the least of the two evils they purchased the West Midland at a price, that is to say, they amalgamated with them, they receiving a certain proportion of the united earnings.

14,820. (*Chairman.*) Those instances which you have mentioned were instances of mistaken judgment on the part of the boards of directors or the shareholders of those lines?—Clearly; but they were not discouraged by Parliament when they came to Parliament with hostile Bills.

14,821. Had they attempted in those cases to amalgamate previously, and had their amalgamation bills been rejected?—Yes, the Shrewsbury and Chester and Shrewsbury and Birmingham endeavoured to amalgamate both with the Great Western and the North-western. The North-western opposed the Great Western amalgamating with them, and the Great Western opposed the North-western amalgamating with them. Parliament rather gave credit to the theory that competition would ultimately result in good to the public. We, on the part of the North-western, took the contrary view. In connexion with the expense of working the traffic, and in order to show what even now, without any compulsion on the part of Parliament, is done by a great railway company for the passenger traffic, I will state the number of passengers booked during two days from Euston. On the 12th and 13th of September 1861, which I believe may be taken as a fair average, there were booked 4,482 passengers, and for the accommodation of those passengers there were sent away trains containing seats for 13,512 passengers.

14,822. (*Sir R. Hill.*) That is about three seats for every passenger?—Yes; that is what they do now without any compulsion. If there was further pressure put on these companies to book through and send their carriages on, as has from time to time been proposed, that evil, which I hold to be a very great one, would be increased.

14,823. Were their reserved seats intended for any expected access of traffic after the train left Euston?—No; it arose from the attempt to send through carriages to so many towns. Then, with regard to the up traffic on those two days, 4,336½ passengers arrived at Euston, and there was space provided in those trains for 13,333 passengers.

14,824. Was there anything peculiar in those days which rendered that an unusual proportion of passengers to seats?—No, that is a fair average.

14,825. (*Mr. Horsfall.*) But those carriages do get some intermediate traffic?—No, it is very small; it is a very troublesome thing to ascertain with any correctness, but I did it with 15 principal up trains. The number of people accommodated by putting on and taking off through carriages from those trains was 179, and to accommodate those 179 persons there were additional seats for 1,274 put on. Now, granting it was an accommodation to the 179, it had the effect of inconveniencing the 4,000; I believe the attempt to further convenience a few people produces a much larger amount of inconvenience to the many, and that we are doing too much in the direction of attempting to send through carriages.

14,826. (*Earl of Belmore.*) Is it not found in practice that an express train which stops at only a few stations has generally fewer unoccupied seats than an ordinary train which stops at many stations?—Yes, at certain seasons of the year the express trains fill well; for instance, in July and August the express trains to Scotland are quite full, and there is scarcely a seat to be got during certain seasons.

14,827. Does not that rather show that in sending out an ordinary train you do, to a certain extent, take into consideration traffic which you may pick up on the way?—No; for it is the case that on approaching a large town a larger number of passengers get in than get out, and in coming away from a large town you discharge a larger number of people than you take in. No doubt that is so.

14,828. (*Mr. Horsfall.*) Is it not the case that at certain periods of the year, such, for instance, as the time of assembling of Parliament, there is a great influx of passengers to London, which renders it necessary to send back comparatively empty the carriages which conveyed them?—That is the case at certain periods of the year, but about September the up and down traffic balances as nearly as possible; on the two days which I have already given there were 4,482 down passengers and 4,336½ up passengers. I endeavoured to take it at a season of the year when there were not those disturbing elements.

14,829. (*Sir R. Hill.*) What are the means which you would suggest for avoiding this waste of room in the trains?—In fact it comes back to this, that railway companies should be allowed to divide the traffic to competing places, and encouraged to make friendly arrangements, by which that intense competition might be mitigated.

14,830. It is a competition for convenience rather than for cheapness, is it not?—Yes; the price of course must be the same, they would both quote the same rates.

14,831. Can you suggest the *modus operandi* by which that can be effected? Would you propose that the Legislature should interfere? Of course it is open to the companies to make such arrangements now if they choose so to do?—But they are looked upon with great disfavour; they go on for a time, then they quarrel and come to Parliament, and they cannot have a better point against their opponent than to say, "They agreed with us not to compete." The breach of such an agreement is not regarded as a crime.

14,832. Then it would appear as though you were of opinion that if the trains can be made proportionate to the number of passengers, so that there should be little or no waste of room, the cost of conveying passengers might be very largely reduced?—I think that the cost of conveying passengers would be very largely reduced, and also the punctuality of the trains would be increased, if some mode of that kind could be adopted. For instance, you set off now with an unwieldy train, consisting of 25 or 30 carriages, when 10 or 15 would suffice.

14,833. I suppose, in point of fact, that the cost of conveying empty carriages is nearly as great as the cost of conveying full carriages?—Very nearly.

14,834. And therefore the cost of running the trains of which you speak would not have been very materially enhanced had the number of passengers been three times as great as it really was?—Not much; of course if passengers have a quantity of luggage that makes a difference.

14,835. But by no means a proportionate difference?—No, only mail bags.

14,836. (*Chairman.*) Would not the public grumble very much if almost every place in the carriages was filled?—I would not suggest anything like the filling up of the carriages as some of the Southern companies do; I think if you attempted to get four or five passengers in one compartment that would be quite enough. But the extent to which the public go is very unreasonable; they fee porters to keep places; they fill up the seats with coats, and say they are occupied; they will not say they are engaged, but they say they are occupied, which is true.

14,837. (*Lord Stanley.*) In fact it comes to this, does it not, that a passenger who has taken a first-class place, unless there is a very unusual number of passengers, thinks himself aggrieved if he has only his own seat?—Yes; and then if he wishes to smoke he fees the porter to lock him up.

C. E. Stewart, Esq.

15 Mar. 1866.

14,838. (*Mr. Gower.*) At whose discretion is the number of carriages put on?—The station master's. But the evil arises very much from having to send through carriages to so many points. There must be a carriage put on for the Buckinghamshire line, another for the Bedford line, another for the Northampton line, another for Leamington, and so on, so that apart altogether from the feeing of the porters there is a great waste, and that must necessarily be, because although when there are three or four passengers only for a place a through carriage must be provided for them.

14,839. (*Sir R. Hill.*) But that waste would be avoided if the passengers were willing to leave the carriages on the main line, and step into carriages on the branch line?—Yes.

14,840. (*Chairman.*) Do you find an unwillingness on the part of passengers to changing carriages?—Yes; the public have been spoilt, but I believe, if they really consulted their own interest with regard to punctuality, that they had better submit to a little inconvenience at the junctions than suffer the delay which necessarily arises from the present system, first of all having their carriage taken off and added to another train, and then if they are in a heavy train of 25 or 26 carriages it does not keep its time.

14,841. (*Earl of Belmore.*) Are carriages ever dropped with slip couplings on the North-western railway?—Yes.

14,842. Does that tend to increase the expense?—It obviates the delay of pulling up at the station, and it also saves carrying on that carriage from that point to, perhaps, the next important station. We drop carriages at Leighton and Watford.

14,843. With a view of sending them down branch lines and leaving them?—With a view of accommodating those two places.

14,844. (*Sir R. Hill.*) I believe you have never been able to devise means for taking up a carriage?—No, only mail bags.

14,845. (*Chairman.*) You think companies are prevented from making arrangements between one another from a fear that all arrangements of the kind are looked upon with suspicion by Parliament?—Yes.

14,846. Can you suggest any general regulation that Parliament might lay down for the guidance of committees?—No; Parliament from time to time have pronounced their opinions, but the committees are not guided by them. The committees are a fluctuating body and disregard instructions. Nothing can be clearer or better than the reports that have been made from time to time by Mr. Gladstone and Mr. Cardwell and the highest authorities in the House with regard to competition in relation to railways, and the countenance or otherwise that ought to be shown to speculators, but committees after a very short time ceased to pay the slightest regard to them.

14,847. (*Sir R. Hill.*) You appear to be of opinion that the difficulties under which railway companies are labouring, and much of the inconvenience which is suffered by the public, are the result of mistaken legislation?—Yes; the evil has its root in the tribunal.

14,848. (*Mr Horsfall.*) Are you prepared to suggest any other tribunal which you consider better?—Nothing beyond this, that there should be established a permanent tribunal of the very highest order and regardless of cost, a tribunal to which we could look with the same confidence and respect that we look to the judges of the land, not a political tribunal, and where everything should be done openly.

14,849. (*Lord Stanley.*) Do you refer to a tribunal having the power of sanctioning the making of new lines?—Yes; Parliament reserving to itself a veto.

14,850. Has it ever struck you that one of the difficulties of creating such a tribunal is that the question to be decided is not a judicial one, but one of administration, that there are no fixed rules of law by which you can decide whether a company should or should not be permitted to take private property for the purpose of constructing a new line?—No doubt, but a tribunal such as I contemplate, sitting permanently and having all the facts before them, would, I think, establish a uniformity of practice.

14,851. (*Sir R. Hill.*) If their decisions were subject to the revision of Parliament, would not that again probably lead to the destruction of the advantage of such a tribunal?—No, I should think not. I should think Parliament would be much more likely to respect the advice and the deliberate decision of such a tribunal. Parliamentary committees are exceedingly jealous of the Board of Trade. They have never treated the reports of the Board of Trade with the slightest respect. They have never been guided by the reports of the Board of Trade.

14,852. (*Earl of Belmore.*) Do you think they would be guided any more by the reports of this tribunal which you propose?—I think they would if it were a tribunal of the mark I contemplate.

14,853. (*Mr. Horsfall.*) Do you think that the system of canvassing on the part of railway managers and railway directors, which we have now in the House, would be diminished?—I think so. I think that Parliamentary committees are not influenced even now by canvassing in the way in which they used to be.

14,854. I am not referring to Parliamentary committees, but when a bill having passed this judicial tribunal comes before the House for a third reading, do you think the members of the House would not be canvassed in the same way as they are now by railway managers?—I think with such a tribunal it would be quite hopeless for them to do so.

14,855. (*Earl of Belmore.*) If you gave Parliament a veto upon the decisions of this new tribunal, would you not, in all very important cases, put the parties to the expense of two hearings instead of one?—If you give a party the right of appeal at the risk of paying costs, I do not see why he should not have it. The matters are very important, and the amounts at stake are enormous, and the rights of parties are liable to be changed to a great extent. I do not see why there should not be an appeal at the risk of the penalty of having to pay the costs.

14,856. (*Sir R. Hill.*) There is no appeal to Parliament from the decision of an ordinary court?—There is an appeal in the House of Lords, but this is not strictly a legal question; take the case of dealing with land for instance, that is not a question which a judicial tribunal could be considered to finally settle; it is a mixed question.

14,857. You appear to entertain the opinion that it would be inexpedient to leave the whole decision with such a tribunal as you have in view?—I think Parliament cannot reasonably be asked to do that. They are not disposed to be relieved even of the preliminary inquiry into details, which I believe could be made better by this tribunal to which I refer; I do not think it would be reasonable to ask Parliament to divest themselves of the power of giving their final sanction to the measure.

14,858. Suppose Parliament were to be willing to hand over its power to such a tribunal, do you think, on the whole, that that power would be better exercised by that tribunal than it now is, or not?—I think it would be better exercised; but still I think the fact of there being an appeal to Parliament might have a very wholesome influence upon that tribunal. One of the great advantages that I see in an appeal or second hearing is that the evidence brought before the first is given with much more caution than it would be if there were no appeal. A reckless or unscrupulous witness is aware that if he gives evidence before the House of Commons it is reviewed before the House of Lords, and that there is time to expose him, and therefore he does not mislead the committee to the extent that in all probability he otherwise would do.

14,859. (*Earl of Belmore.*) At present opponents only are able to exercise the right of appeal, because if the promoters lose a bill in the House of Commons they cannot proceed any further that session?—I think that is correct.

14,860. Would you propose that an appeal should be given to either party from the tribunal to which you

refer?—No, I should not allow them to come to Parliament unless they satisfied this tribunal.

14,861. (*Mr. Horsfall.*) Has not considerable advantage arisen from the appointment of the referees before whom bills are now taken?—I think the general opinion is that there has. There was a great difference of opinion last year upon the subject. It was said that in some cases the inquiry before the referees added to the expenses, but those were quite exceptional cases. I believe, on the whole, it has done well.

14,862. (*Mr. Gower.*) Do you think there is a greater disposition to mislead the second tribunal than there is the first, owing to the circumstances you have mentioned?—No, because evidence is looked at with suspicion when brought forward for the first time before the second tribunal. Supposing the first hearing is in the House of Commons, the House of Lords accepts a large proportion of the proof on trust. They inquire into new matters which are raised before them upon questions of principle, but the inquiry befor the House of Lords is generally very much shorter than that before the House of Commons.

14,863. (*Chairman.*) You have stated it to be your opinion that a great many unnecessary lines have been made?—Yes.

14,864. Do you think that no further lines are wanted for the public advantage, or will be required in the course of a few years?—I believe that a very much larger amount of railway accommodation will be required in the country, and that we are now only in our infancy. What I desired to convey was, that lines have been made in a much more costly manner than was necessary. Duplicate lines have been granted. In many cases the same amount of capital expended systematically would have produced a much larger amount of accommodation and convenience than has been afforded by the expenditure which has been made.

14,865. You are of opinion that a great extension of the railway system will be hereafter required for the public advantage?—Certainly; I think it would be very dangerous, indeed, to assume that the limit has been at all reached. I may mention a case, with reference to crossing the Thames. Authority was given to the Great Western and the North-western to cross the Thames, being an extension of the West London railway, but at that time it was considered to be so costly that those two companies abandoned their powers. I am afraid to say how many bridges there are now across the Thames of a much more costly character than the bridge which was proposed for the extension of the West London railway. It is made now; but in those days if anybody had suggested the possibility of there being half the number of communications across the Thames that there are now, he would have been laughed at. I believe many cheap lines of railway will be made between points throughout the country. I do not think there is much room for additional through communications. I think the Great Western, the Midland, the North-western, and the Great Northern, Lancashire and Yorkshire, North-eastern, and other lines, accommodate nearly all the important towns in Lancashire and Yorkshire.

14,866. (*Sir R. Hill.*) What description of lines do you refer to when you speak of cheap lines?—Single lines. They are the only lines that will pay in agricultural districts.

14,867. With sharper curves, steeper gradients, and so forth?—Yes.

14,868. Have you considered the question of the possibility of adopting a narrower gauge?—It has been suggested with reference to some of the very hilly parts of Wales; but there is, of course, great inconvenience from having a break of gauge.

14,869. You are no doubt aware that some have been constructed in Wales?—Yes; they have a gauge of two feet, which does very well for slate railways.

14,870. They have also been constructed in that manner in our Indian empire?—Yes.

14,871. And also in Australia?—Yes. Last year the North-western had it in their contemplation to construct a railway in their mineral districts on a two-feet gauge, but that is quite an exceptional case.

14,872. When you spoke of cheap lines, did you refer to that description of line?—No, I meant cheap lines on the ordinary gauge of 4 feet 8½ inches. Instead of two or three companies coming before Parliamentary committees to obtain the right of making additional lines, and putting forward as a plea that they would make the lines, if granted to them, in the most costly manner, going through towns and valuable property, it will be found that if they are to pay at all they can only be made to pay by pursuing just the opposite course—of making the cheapest lines, less good gradients, less good curves, and avoiding valuable property.

14,873. (*Chairman.*) Have you any reason to think that under the present system all the additional lines of railway that will be required will not be gradually constructed?—Yes, I have that apprehension very strongly. Two years ago, in giving evidence before a Select Committee of the House of Commons, I detailed the particulars connected with the passing of the Stafford and Uttoxeter railway, and stated my belief that the sanction given by Parliament to such schemes was throwing so much doubt on the stability of the four hundred millions of capital expended in the construction of railways in this country, that *bonâ fide* investors can no longer be found to embark capital in new railways. This opinion is fully confirmed by Lord Redesdale, who so lately as the first of the present month, when addressing the House of Lords, stated that the question of railway legislation had become so serious that he thought he should feel himself bound to call attention to the subject. He referred to the fact, that at the present time no capital was fairly found for the promotion of schemes before Parliament, and expressed his opinion to be, that that was one of the causes why so many were not proceeded with after passing through only a few stages; while in some cases they proved abortive, even before they were introduced into Parliament. He went on to state that the system had reached such an excess of abuse that Parliament was bound to interfere. This is, indeed, a very serious question in the interest both of the shareholders and of the public.

14,874. You are of opinion that the present system rather discourages the making of lines which the public convenience really requires?—Yes. I think if the old established railway companies were maintained in a better condition, that it would be their desire, as it would be their interest, to expend capital in giving the necessary accommodation, which at present they are very unwilling to do. I recollect within the last three years there was an agitation among the North-western shareholders of a very serious character, by means of an association respresenting millions of capital; what they desired the directors to do was to close the capital account, and spend no more money. Their dividend had been brought down to 3¾ per cent. for the first half-year, and 4¼ for the second half-year, and they were in a state of panic. I believe it would have been unwise to have done what they desired to do, but they were of opinion that that was essential to their salvation, and they urged very strongly upon the directors that there should be a cessation of all expenditure.

14,875. (*Sir R. Hill.*) Do you think the directors had practically any option, whether to expend or not, what had been expended upon these additional lines?—I do not think that the additional lines were the cause of the reduction of the dividend, but that the cause was competition and the cost of working.

14,876. But have not all the old companies constructed branch lines which have proved unremunerative?—Yes, some of the lines have proved unremunerative, but it really is not a question of the expenditure of capital. The cause of the diminution of the North-western dividend was not the expenditure of capital, but abstraction of traffic, reduction of receipts, and an increase of the working expenses.

14,877. (*Chairman.*) Do the working expenses bear a larger proportion to the receipts now than they did in the early days of the working of railways?—

C. E. Stewart, Esq.
13 Mar. 1866.

Yes, they were at one time as low as 37 or 38 per cent. on the North-western. In 1850 they were 37 per cent. They then rose to 47 per cent., and afterwards to 51 per cent., consequent on the competition between Manchester and London. They are now at 46 or 47 per cent. I may state this, which has pressed very much upon me, that 10 per cent. in the working expenses of the North-western makes a difference of 600,000*l.* a year in their net profits.

14,878. (*Mr. Horsfall.*) And to what extent would that affect the dividend?—About 2½ per cent.

14,879. (*Sir R. Hill.*) Do you think that a saving of 10 per cent. in the working expenses would be practicable if trains could be kept no longer than was necessary for the convenience of passengers?—No, not from that source alone, but I believe if the whole of the traffic of the country were worked harmoniously with reasonable and good accommodation to the public, that you might make a reduction of 10 per cent. upon the general working expenses throughout the kingdom, and that would represent millions per annum.

14,880. (*Chairman.*) Is the cost of the conveyance of mineral traffic capable of being reduced?—Not so much as the passenger and merchandise traffic. I believe that is worked much more economically relatively than other traffic.

14,881. (*Sir R. Hill.*) Is that the case with regard to coal?—Yes, contracts are generally made by which it is sent in full train loads on particular days, and it is so arranged as to avoid much loss with regard to empty waggons. In fact it is worked on commercial principles.

14,882. You would desire to see the same principle extended to the conveyance of passengers and goods?—So far as it can be done consistently with economy and the interests of the public.

14,883. And you think it may be done to a great extent without seriously incommoding the public?—I believe so; I believe that the expense of the whole of the railway system of the country can be reduced 10 per cent. without diminishing as a whole the convenience or the service now rendered to the public.

14,884. I believe the total receipts of the United Kingdom for a year upon all classes of traffic amount to 34,000,000*l.* What is allowed for working expenses is on the gross?—The 10 per cent. is on the gross, that would be 3,400,000*l.* a year.

14,885. (*Chairman.*) I do not understand that you have made any other suggestion for accomplishing a reduction of the working expenses as much as 10 per cent., except that railway companies should go before a different tribunal when they have new schemes to bring forward?—That there should be a different tribunal, and a different mode of dealing with railways by Parliament. If Parliament comes to the conclusion that a state of antagonism between railways and erratic competition is essential for the public interest, there is an end of it. If, on the other hand, they come to the conclusion that such competition has failed to give to the public corresponding advantages to the evils which it has induced, then I say that a permanent tribunal would tend to restore confidence between the railway companies and between the railway companies and the Legislature, and would produce, in time, the results indicated.

14,886. Do you think competition has been on the whole productive of great advantage to the public, and that it should not now be carried any further?—Yes, but I think the evils of erratic and reckless competition have for some time outweighed the further benefits to be derived.

14,887. (*Sir R. Hill.*) Do you think that is the prevailing opinion among people connected with railways?—Amongst those representing the old companies, certainly.

14,888. (*Mr. Horsfall.*) But it is not the prevailing opinion of the public?—I think the public who understand the question agree in deprecating violent and temporary competition.

14,889. (*Sir R. Hill.*) Do you think that the variety of classes is one cause of the excessive length of trains?—In some degree, but that is not material.

14,890. Supposing it were practicable, would a reduction from three to two classes materially affect the amount of waste room in the trains?—No, because that difficulty is met now by composite carriages. Besides I do not think it would be practicable to reduce the three classes to two classes, because there is a clear line of demarkation between first, second, and third class in this country.

14,891. If there were a very large reduction of fares, might it not then be practicable to reduce the classes from three to two?—No; I do not think people would like it; I think they arrange themselves into classes, and that they would be unwilling to reduce themselves from three to two in this country. They do not like a large carriage with many people, which, on the continent, is thought preferable; but the English people do not like it.

14,892. (*Chairman.*) Many complaints have been made before this Commission by many parties of the inequality of rates between different places; was that a point which came under your notice as secretary to the North-western?—No, that would come more immediately under the notice of the manager, who would be able to give you better information on that point than I can.

14,893. Will you state generally whether you think the principle of uniform mileage rates is a good one, or the reverse?—I think it is inadmissible; it would destroy what I think is a great advantage of and to railways, competition between different ports. I think competition must fail between two railway companies from its intensity and directness; but railways may be made very valuable by bringing ports and markets into competition with each other. I illustrated what I mean on a former occasion by taking the case of sugar being sent from Liverpool to an inland part, such as Carlisle. I say you might duplicate or quadruple the railway between Carlisle and Liverpool, and you will not affect the price of sugar at Carlisle; but if you extend, as you have extended, the railway from Carlisle to Greenock, and bring Greenock into competition with Liverpool, then you give the public the benefit of cheaper sugar. That competition is not so direct; numerous merchants and shipowners are parties to it; managers do not come together and say, "We cannot stand this any longer, "let us put an end to it," and they go on competing. I believe you will find at central points of that kind great benefit has resulted to the public from competition obtained by means of railways between those ports and their merchants. But there would be an end to such competition if Liverpool or any other port were placed at a disadvantage or an advantage, as the case might be, by compelling the railway companies to charge an equal mileage rate.

14,894. (*Mr. Horsfall.*) Has not the North-western Railway Company the right of running over the Caledonian to Greenock and Glasgow?—There is, I believe, a bill in Parliament this year for securing them that right by consent.

14,895. Is there a uniform mileage rate contained in that bill?—I cannot state positively. I believe competition by means of the extension of railways to various ports, and allowing the companies to carry on their traffic just as merchants or shipowners carry on their traffic, and get the best rates they can, or the largest amount from any transaction which comes before them, so long as they are within the Parliamentary charge, will be the best.

14,896. You think there would be no injustice in one port charging a very much lower rate per mile than another port?—Certainly not, any more than a shipowner who charges a different rate per mile from one port to another.

14,897. But there is this difference between the shipowner and the railway, that the shipowner has competition and the railway company has none?—There is, I am sorry to say, too much competition between railways, and a very strong competition from Greenock to Carlisle.

14,898. With what?—With the Glasgow and South-western. I have been unable to see why the railway company should be compelled to charge a higher rate per mile to one port than to another. I have got from Liverpool as much as I can, within my Parliamentary powers, but I cannot obtain from Hull, or any more distant point, traffic at an equal mileage rate, and if I attempt it I shut myself out entirely, and in shutting myself out I shut out the town with which I am in communication.

14,899. (*Sir R. Hill.*) Is not the question which they have to consider this, viz., whether it may not be better to carry at a low rate than not to carry at all?—Yes, clearly. They may have outward traffic to some distant point from which the waggons would otherwise come back empty and then it would suit them to carry at a lower rate per mile. There would be no injustice to Liverpool if they acted in that way. It will be found that although it may be a less rate per mile from those distant points compared with Liverpool, that Liverpool happens to be very favourably situated with reference to the most important manufacturing districts.

14,900. You estimate the possible saving of working expenses at 10 per cent. on the gross receipts?—Yes.

14,901. I think you have stated that the working expenses of the North-western railway amount to about 47 per cent.?—Yes; they have been upwards of 51. There are many railways in the kingdom whose working expenses are from 60 to 70 per cent.

14,902. Then it would appear that the practicable saving upon the working expenses would be nearly 40 per cent.?—No; 10 per cent. on the gross receipts.

14,903. Ten per cent. upon the gross receipts would be about 20 per cent. upon the present working expenses?—Yes. *C. E. Stewart, Esq.* 15 Mar. 1866

14,904. You think that a practicable saving?—I believe that that saving might be ultimately effected. I believe that the same amount of service might be rendered to the public by the harmonious working of the railway system which is now rendered, and at the same time a saving of 10 per cent. effected.

14,905. That would of course render it practicable to lower the charges to the public considerably?—Yes.

14,906. Do you think that the companies would lower the charges?—Some of the large companies have a great deal of leeway to make up, such as the Great Eastern and the Great Western. The Great Eastern shares are at a discount of 60, and the Great Western shares at a discount of 40 per cent.

14,907. Then the result would be, either that the charges to the public would be considerably lowered, or the dividends of the shareholders considerably augmented, or that the advantage would be divided between the public and the company?—I should like to divide, and that immediately, the advantage between the company and the public.

14,908. Is not that likely to be the result if such a saving were effected?—If such a saving were effected on that basis.

14,909. Have you anything to do with the question of the rating of railways?—I have not.

14,910. You cannot give any information upon that point?—No.

The witness withdrew.

Adjourned.

Tuesday, 20th March 1866.

PRESENT:

The Right Hon. The Earl of Belmore.	T. B. Horsfall, Esq., M.P.
The Right Hon. Lord Stanley, M.P., F.R.S.	Capt. Douglas Galton, R.E., C.B., F.R.S.
The Hon. E. F. Leveson Gower, M.P.	William Pole, F.R.S., *Secretary.*
Sir Rowland Hill, K.C.B., F.R.S.	

His Grace THE DUKE OF DEVONSHIRE, K.G., F.R.S., in the Chair.

Edward J. Page, Esq., examined. *E. J. Page, Esq.* 20 Mar. 1866

14,911. (*Sir R. Hill.*) What is the appointment you hold in the Post Office?—That of Inspector General of Mails.

14,912. You, I believe, prepared the returns sent by the Post Office to this Commission?—Those for England and Scotland were prepared in my department, those for Ireland were not.

14,913. I think that is shown on the returns themselves?—That is so.

14,914. In the return for Ireland, does the speed given include stops, as it does in Great Britain?—I have very little doubt that it does, because it is the custom of the Post Office always to include stops in such returns, but I cannot say for certain, as I did not prepare the return.

14,915. What is the total cost of the service?—The total cost of the railway mail service for England is about 399,000*l.* a year, for Scotland about 75,000*l.* a year, for Ireland about 83,000*l.* a year, making a total for the United Kingdom of 557,000*l.* a year.

14,916. Which is the quickest of all the mail trains?—The fastest mail train we have is in England; that is the continental mail train from London to Dover by the South-eastern line; the distance, which is 88 miles, is performed in an hour and 55 minutes, which gives a rate of speed within a fraction of 46 miles an hour.

14,917. I observe that certain trains run exclusively for the conveyance of the mails?—We have only one exclusive mail train at present in the kingdom, and that is the night mail train between London and Bristol.

14,918. Others appear to be restricted as regards the number of passenger carriages; which are they?—There is only one mail train restricted, and that is the night mail train from London to Edinburgh and Glasgow, and back.

14,919. What is the object of these limitations?—The object the Post Office had in view, both in the the case of the exclusive train and the limited train, was to get rid of the very serious irregularities in the performance of the service that existed before the adoption of that exclusiveness and limitation. The effect has been very marked indeed. The night mail train upon the Great Western line works with wonderful punctuality, and the limited mail train to and from Scotland, although not so punctual as the exclusive train, is still very fairly worked indeed.

14,920. Then the object which the Post Office had in view has been attained to a great extent?—To a very great extent it has been.

14,921. You appear to send a great many mails by ordinary trains over which the companies retain full control, and which are not, in fact, mail trains; have you the means of comparing the number of miles thus traversed by mails by ordinary trains with the number of miles traversed by mail trains under notice?—I think I have. In England, taking the service for a single week day, I find that the mails were conveyed by railway over a distance of 46,000 miles, of which about 10,000 were trains under legal notice, that is to say, fixed trains, and about 36,000 miles were ordinary trains, over which the Post Office exercised no control. In Scotland the fixed mail trains in one week day travelled over about 2,300 miles, and by ordinary

E.J.Page, Esq.
20 Mar. 1866.

trains mails were conveyed over 5,700. In Ireland the mileage of the fixed trains was about 1,660, and of the ordinary trains about 4,100 in a single week day.

14,922. What would be the total of daily mileage of the several trains carrying mails in the United Kingdom?—As nearly as possible 60,000 miles a day, including trains under notice and ordinary trains.

14,923. You draw a distinction between ordinary trains and trains under notice, will you explain what is meant by trains under notice?—Trains under notice are trains the hours of working of which the Postmaster-General fixes and controls. He derives the power of doing so from an Act of Parliament, which enables him at any time to establish a mail train at any hour of the day or night on giving a certain notice, and enables him also at any time on giving a certain notice to alter the hours. No company can alter the hours of such a train under any circumstances whatever without the concurrence of the Postmaster-General.

14,924. I think the Postmaster-General also fixes the places at which these trains shall stop, does he not?—He does.

14,925. It appears from the Post Office returns that in some cases a separate payment is made for each service, and that in other cases there is a general contract for a lump sum; what has been the general principle as to payment on which these contracts have been made?—Contracts of that description have generally been made after an arbitration has taken place: a certain amount of fixed mail service is ordered by the Postmaster-General, and the railway company and the department being unable to agree as to the rate, the remuneration is settled by an arbitration.

14,926. That is done in accordance with the provision in the Act, is it not?—Precisely. If the result of that arbitration is, on the whole, tolerably satisfactory, and the remuneration is deemed by the Postmaster-General to be not very excessive, the custom has been to apply to the railway company to invite them to make the payment permanent, and enter into a contract for a term of years, the total payment consisting of the total annual sum awarded under the arbitration, and the whole of the ordinary train service being thrown in, as it were, without extra charge. Frequently when the result of the arbitration has gone against the department, as it not unusually does, the companies have been induced to agree to some deduction from that payment, and then to enter into a contract for a term of years, throwing in the ordinary train service.

14,927. The rates of payment made by the Post Office appear to vary very greatly. Is there usually such an amount of difference between different services as to account for such variation?—There frequently is a considerable difference between the different services performed on railways, but it has been found that where the services are very nearly identical, or at any rate very similar, the payments have varied very largely indeed; I mean the payments awarded under an arbitration.

14,928. Will you be kind enough to give some instances of varying payments?—Perhaps the Commissioners will allow me to avoid mentioning the name of the Company, unless it is really necessary, in order not to excite angry feeling by appearing to hold up any particular company to invidious comment. A case occurred in the north of England, where a train which was previously running was placed under legal notice. An arbitration was resorted to, and the payment awarded was 3*s.* per mile, the accommodation required in that train being one whole carriage. In Scotland another case occurred, in which a train was previously running and the Postmaster-General placed it under legal notice, requiring one compartment of the carriage. In that case the payment awarded was only 6*d.* a mile, the difference between 3*s.* and 6*d.* being of course quite inexplicable, looking at the small difference in the accommodation required for the mails.

14,929. The cost to the company being much the same whether it uses a compartment or a whole carriage?—I should imagine there is very little difference indeed.

14,930. Can you cite any other case?—I have two others that are very marked. In two cases, one in England and one in Scotland, a train service was placed under legal notice, the payment awarded by the umpire being in the one case $1\frac{5}{8}d.$ per mile, and in the other case $2\frac{1}{2}d.$, one compartment of the carriage being allotted to the Post Office in each case. Two other instances occurred, one in Ireland and one in England, in which the train service was placed under legal notice. The same amount of accommodation was required, that is to say one compartment, in each cases the payment awarded in Ireland was 1*s.* a mile, and in England 2*s.* a mile. The Post Office has never been able to understand why there should be that extraordinary difference between the payments for service; so nearly similar.

14,931. When an arbitration takes place, I think the decision is generally made by an umpire chosen by the two arbitrators?—Latterly the decision has almost always been given by an umpire; but in the earlier periods of arbitrations, some 15 or 20 years ago, it frequently happened that the arbitrator of the Post Office and the arbitrator of the company were able to agree, without having recourse to the umpire.

14,932. In the cases you have cited, I presume the umpires were different?—In the cases which I have cited of very heavy payments, the umpires were generally different; but it happens that the same umpire awarded nearly all the low payments I have quoted.

14,933. Have you any knowledge of what is the bare additional cost of running a train (say an engine and a single carriage) per mile?—I do not know of my own knowledge the cost, but I find, in an address delivered by Mr. Robert Stephenson some 10 years ago, that he estimated the bare additional cost of running a train at 1*s.* 3*d.* per mile, of which $9\frac{1}{2}d.$ was allotted to locomotive expenses. I am under the impression that the bare cost of running a train has, if anything, somewhat decreased since those days.

14,934. I think he was speaking of an average train, was he not?—I have no doubt that he was speaking of an average train. He uses the term "running a train."

14,935. Can you compare this cost with some of the rates of payment which have at different times been paid under an award for railway mail service under notice?—I can. I will read a short list of payments that have been awarded, commencing as high as 2*s.*:—

	Per Single Mile.	
	s.	*d.*
Chester to Birkenhead	2	0
Dublin to Drogheda	2	0
Leeds to Selby	2	0
London to Bristol and Gloucester	2	$0\frac{1}{4}$
Ipswich to Colchester	2	$0\frac{1}{2}$
Ely to Yarmouth	2	1
Peterborough to Grimsby	2	2
London to Dover	2	3
Londonderry to Strabane	2	4
Arbroath to Aberdeen	2	6
Lancaster to Carlisle	2	6
Southampton to Dorchester	2	$8\frac{1}{4}$
Perth to Dundee	3	0
Dublin to Galway	3	0
York to Berwick	3	0
Dundee to Arbroath	3	1
Preston to Liverpool	3	1
Dundalk to Castleblaney	3	2
Parkside to Preston	3	6
Exeter to Plymouth	3	7
Grange Court (near Gloucester) to Haverfordwest	3	7
Drogheda to Dublin	3	9
Drogheda to Dundalk	4	0
Dublin to Cork	4	6
Limerick Junction to Limerick	4	6

The highest payment, I believe, ever awarded, and that only in Ireland, has been 4*s.* 6*d.* per mile.

14,936. These high rates of charge were not for the whole train, but for a part of the train?—In each case they were for the conveyance of mails by trains, which

also carried a considerable amount of passenger and parcel traffic.

14,937. Was there in any case more than a whole carriage required for Post Office purposes?—In one of the cases only was there, I believe, more than a whole carriage required by the Post Office.

14,938. Which was that mail?—From Preston to Liverpool. In that case I am under the impression that besides a sorting carriage there was a van for mail bags. I am a little doubtful, also, whether there may not have been a van as well as a sorting carriage from Dublin to Cork; but I rather think not.

14,939. In many cases less than a whole carriage was required for Post Office purposes?—In many of them.

14,940. You are speaking of a state of things that existed many years ago, are you not?—I am, because at the present moment, owing to the large number of fixed contracts made in the way I have described, it is very difficult to separate the rate of payment for any particular service from the lump sum.

14,941. The list which you have read I think appears in a report which was made by you to the Postmaster-General some 10 years ago, does it not?—It appears in a report which I made, addressed to the Postmaster-General, 10 years ago, in reply to certain statements made by Mr. Robert Stephenson at the Institution of Civil Engineers.

14,942. And which was published in the report of the Postmaster-General at that time?—It was published in the second report of the Postmaster-General issued in 1856.

14,943. Who was the Postmaster-General then?—The Duke of Argyll.

14,944. Can you give illustrations of wide differences of opinion between the Post Office arbitrator and the company's arbitrator in any arbitrations which have come under your notice?—I may mention two cases which occurred some years ago, and which were much dwelt upon by the Duke of Argyll at the time when attempts were being made to improve the legislation between the Post Office and the railways. A case occurred in Scotland, in which the arbitrators being unable to agree selected their umpire. The mileage first demanded by the railway company was 9*s.* a mile. That which was claimed by their arbitrator in the arbitration was 6*s.* 0½*d.* per mile. That which was proposed by the Post Office arbitrator was 3½*d.* per mile; and the amount which was awarded by the umpire was 3*s.* 3*d.* per mile. A subsequent arbitration occurred with the same company, with results almost as startling. The mileage asked by the company was 8*s.* 6*d.* The mileage proposed by the company's arbitrator was 5*s.* 9¾*d.* The mileage offered by the Post Office arbitrator was 1*s.*; and the award of the umpire, who is a member of this Commission, was 1*s.*

14,945. Will you give the name of the umpire on that occasion?—Lord Stanley.

14,946. (*Lord Stanley.*) In those cases, and especially that case to which you have last referred, is not the secret of the great difference between what the Post Office are willing to pay and what the railway companies ask this, that the railway companies in many cases claim for the whole cost of running a train, which they contend they would not run unless to satisfy the Post Office demands?—That is very frequently the line of argument taken. The railway companies not only claim the whole cost of running the train, that is to say, the whole additional cost, but they claim the whole cost of running the train, assuming that the train bears its full share of the fixed expenses, in other words, the average cost of running a train on that line.

14,947. On the other hand the contention of the Post Office is, that they ought only to pay for such accommodation as they require?—The Post Office view has generally been, that railway companies should be reimbursed the whole additional expenses of every kind which they are put to, and receive in addition a considerable profit.

14,948. (*Sir R. Hill.*) Will you now proceed to state generally in what respect you consider that the relations between the Post Office and the railway companies are unsatisfactory and require amendment?—The view of the Post Office has been, seeing the great want of uniformity in the decisions of umpires, that it is necessary to introduce some specification into an Act of Parliament, which shall in some way guide the umpires to a decision; in other words, that some endeavour should be made to define what is "reasonable "remuneration." The Act of Parliament says, that every railway company shall be entitled to "reasonable "remuneration;" but inasmuch as no attempt has been made to define that "reasonable remuneration," we are left to the individual judgment of every different umpire; and an amount which one umpire may consider very reasonable, another umpire may consider a great deal too high, or a great deal too low; consequently we have had to pay, as I have before stated, for similar services different rates of remuneration, which are altogether irreconcileable with the circumstances of the cases. Perhaps you will allow me to give an illustration of that want of uniformity in the decisions of umpires, in cases where the service arbitrated for has been performed upon the same line. I may mention the case of the North-eastern railway. I select that, partly because I believe the manager of that railway has made certain complaints against the Post Office in the evidence which he has given before this Commission. An arbitration took place with that company in the year 1854. An award was given by the umpire, the result of which gave the railway company a payment at the rate of 31,000*l.* a year, that payment being made up of different rates for different services. Three years afterwards another arbitration took place with the same company. The service had undergone very little change; it had very slightly increased; and the payment awarded by the umpire then amounted to 37,000*l.* a year, being an increase of 6,000*l.* Two years after that, another arbitration took place, the service still remaining very similar to what it was before, and the payment then awarded was 43,000*l.*, being a further addition of 6,000*l.* a year. The second of those arbitrations (that under which 37,000*l.* was awarded) affords another remarkable illustration of the difference of opinion between the Post Office arbitrator and the company's arbitrator. The arbitrator for the company asked for one of the trains 4*s.* a mile. The Post Office arbitrator proposed 7½*d.* The umpire awarded 2*s.* 6*d.* In the case of another train the company's arbitrator proposed 5*s.*; the Post Office arbitrator proposed 1*s.*; the sum awarded was 3*s.* For another train 2*s.* was asked by the company's arbitrator; the Post Office arbitrator proposed 1*d.*; and the umpire awarded 4*d.* For another train 2*s.* was proposed by the company's arbitrator, a halfpenny was offered by the Post Office arbitrator, and the sum awarded was 4*d.*

14,949. Were all these services under notice?—Yes; we have never gone to arbitration except for service under notice.

14,950. To what do you attribute this want of uniformity?—To the cause I stated just now, namely, the total absence of any definite principle of valuation to guide the judgment of the umpires. No attempt has been made to regulate or define the principle upon which the rate of remuneration is to be based.

14,951. What is the next point in which you consider that the relations between the Post Office and the railway companies require amendment?—I have hitherto spoken of trains the hours of which are fixed by the Postmaster-General; but, as I have shown in answer to one of the questions as to the extent of service by fixed and ordinary trains respectively, a very large portion of our service now consists of mails conveyed by trains which are entirely within the companies' own control, which the Postmaster-General does not attempt in any way to control, and, in fact, does not wish to control. We have hitherto failed to discover any means of bringing a service of that kind under arbitration. Our lawyers tell us, that the Postmaster General, if he serves a notice, of necessity fixes the hour, consequently the train ceases to be an ordinary train. We are, therefore, dependent entirely upon

E.J.Page, Esq.

20 Mar. 1866.

the consent of the company to convey bags by ordinary trains. Our difficulty with regard to these ordinary trains is, that we are unable to send our bags at a fixed rate of mileage according to weight; in fact we are unable to send them at all, except after previously negotiating with the company in order to ascertain what they will charge. We are, therefore, worse off than the public at large is with regard to parcels. The public can send a parcel at a fixed rate, advertised by the company, the maximum of which is regulated by the company's Bill; but the Post Office cannot do anything of the kind. The service which the Post Office requires is very much less than that which the public requires with respect to parcels. The parcels of the public have to be collected in the first instance, then conveyed, and finally delivered; whereas the service which the Post Office requires by an ordinary train consists merely in the conveyance of bags; our own porters take them to the station; our own porters meet them at every intermediate station, and at the terminal point; consequently the service we require is very much less costly to the company than the parcels service of the public; and yet many railway companies have persisted in refusing to allow the Post Office to send bags at the full parcel charges made to the public, those full charges being charges for merely occasional service, whereas the Post Office service is daily; and therefore one would imagine it ought to be charged for at a rate considerably below a similar service performed only occasionally.

14,952. That is to say, the Post Office, though sending a parcel, or a bag which may be called a parcel, day after day by the same train, has to pay a rate higher than that which the public pays for an ordinary parcel of the same weight sent once, and only once, and that notwithstanding that the company is relieved of that which is unquestionably the chief expense incurred in respect of parcels, namely, their collection and their delivery?—Precisely. Many companies have refused terms of that kind; but at the same time it is right I should admit, that a few companies have allowed us to send bags at the full parcel charge.

14,953. Then you are of opinion that the Post Office is worse off with regard to sending mail bags by ordinary trains than the public at large is with regard to parcels?—Clearly; because we cannot send bags at all by an ordinary train, without coming to terms with the company, who may ask any rate of payment they think proper.

14,954. The alternative, which is within the power of the Post Office, being either to put the train under notice, and so fix the time, and consequently pay for having fixed the time, on the one hand, or not to send the mail at all on the other; is it not so?—That is so; but I should qualify what I have stated in this way, that the Postmaster-General has the right of sending a mail guard with his bags, paying the fare of a passenger, so that I was not quite right in stating that, failing an agreement, he could not send the bags at all. He can resort to that expedient; but, as I will show presently, there are difficulties attending that course of proceeding which make it practically of very little use to us.

14,955. What in practice has been the effect of this defect in the legislation?—The effect has been a very high rate of charge for the ordinary train service, and, in consequence, often great delay in establishing mail service, and in extending the facilities of the public. A remarkable case occurred some years ago with regard to a service of this description. It was the case of a day mail to the small town of Alton, in Hampshire. Application was made by the inhabitants for that day mail in the year 1852. The Postmaster-General was quite willing to give the accommodation, provided the service could be established on terms which the number of letters to be carried would warrant. He applied to the company to know what they would charge for conveying such a bag to and from Alton, there being already a day mail on that line as far as Farnham. The bag would probably have weighed at the outside about 3 or 4 lbs. The company demanded 4*s.* a day, which would have amounted to 62*l.* a year, whereas the full second-class fare for a passenger and his luggage would only have amounted to 47*l.* a year. The result was that the day mail was not granted. The inhabitants rested content for a period of about four years, when they renewed their application. The Postmaster-General then again applied to the company, and their demand at that time was 1*s.* 3*d.* in each direction, or 39*l.* a year. That was more than the letters warranted, and the company were asked if they would take the bag at the parcels rate; but they declined. Again the question slept for 12 months, when a renewed application was made by the inhabitants, backed up by some influential recommendations, and on our again applying to the company, they said they would carry the bag at the parcels rate, provided the minimum charge was 8*d.* The minimum charge for a parcel would probably have been about half 8*d.*, but the company said they would carry the bag for a minimum charge of 8*d.* for a period of 12 months, at the expiration of which period they should expect the payment to be raised to 1*s.* 3*d.* each way, the amount of their former offer. The cost at 8*d.* would have been 20*l.* a year; the cost at 1*s.* 3*d.* each way would have been 39*l.* a year. The Postmaster-General was again compelled to refuse to grant the day mail, and the inhabitants had to do without it until the year 1861, nine years after they first applied for it, and then they only got it on our entering into a general contract with the South-western Railway Company, which entitled us to send bags by any ordinary train. That of course is an extreme case; but still numberless cases have occurred to my knowledge in which very great delay has occurred in increasing the accommodation of the public, because the companies asked terms which were altogether incompatible with the value of the services proposed to be rendered.

14,956. If I understand you correctly in the instance which you have cited, although the Post Office would have relieved the company of all the expense of collecting and delivering the parcel, the company demanded that the Post Office should pay twice as much as the public pays for a service which includes collection and delivery?—Quite so.

14,957. But in cases where you have succeeded in coming to terms, have those terms been reasonable, or have they varied very widely for nearly similar services?—We have very seldom obtained terms which we considered altogether satisfactory for mail service by ordinary trains. The lowest charge that has ever been made to us has been the full parcel rate, which charge, as has been shown before, is at least twice what it ought to be, considering that the Post Office does its own collection and delivery. But very few companies have been contented with even the full parcel rate. It has been much more usual for companies to demand the second-class fare of a passenger, although the weight of bags conveyed has been only a fraction of the amount of luggage allowed to the passenger, and the Post Office has sent no mail guard to occupy space in the train. Other companies have conveyed bags at the return second-class fare; but, in many cases, we have been unable to agree either on one condition or the other that I have named above; and, after trying to overcome the difficulty for a considerable time, the Postmaster General has adopted the course of serving a notice upon railway companies, in which notice it was specially mentioned that, although the hour was fixed in accordance with the Act of Parliament, he, the Postmaster-General, granted the company full permission to vary the hours from time to time as they thought proper, on giving the Post Office a notice of about 10 days; practically, he left the train quite at the company's own discretion, because it is well known that railway companies usually fix their changes month by month at least 10 days beforehand; and the imposition of that notice therefore subjected them to little, if any inconvenience. Under such a notice as that which I have last described, service by ordinary trains has been performed in different parts of the kingdom, and an arbitration has taken

place for deciding what the payment should be. Although the service was nearly identical with an ordinary train service, in no case has the Post Office succeeded under an arbitration in getting a lower payment than $3\frac{1}{2}d.$ per mile for such a service; and in one case the payment awarded was as high as $7d.$ per mile. I should mention, that even in the case of the high payment I have named, viz., $7d.$ per mile, the aggregate weight of bags conveyed did not exceed that allowed to a passenger for luggage.

14,958. Do you know what a second-class passenger would have paid per mile by the same train for himself and his luggage?—I believe the full fare would have been very little more than $1d.$ per mile, and the return fare something like $\frac{3}{4}d.$ per mile.

14,959. Whereas the Post Office, for a weight less than a passenger's luggage, the mail being unaccompanied by a guard, or any one to take the place of a passenger, had to pay $7d.$ per mile?—Precisely.

14,960. What is the next point with regard to which you consider the relations between the Post Office and the railway companies are unsatisfactory?—I mentioned just now that Parliament had given the Post Office the right of sending a mail guard, paying his fare as a passenger, and subject to the ordinary regulations of the company for any excess in the weight of the bags over that allowed to a passenger; but owing to the opposition of some railway companies that facility has been rendered to a great extent inoperative, because the companies have denied our right to allow the mail guard to exchange bags at intermediate stations, and inasmuch as it very rarely happens that a mail guard sent with bags has *not* got to deliver them at intermediate stations, the questioning of that right has almost entirely negatived the intention, as I believe, of Parliament in giving the facility to the Post Office. Great dispute has arisen on this very point, and it was so important a one to the Post Office, that in the first case that occurred in Scotland, an action was commenced against the company to endeavour to bring the question to an issue. The case was tried in the Court of Session, and the decision given was, that the Post Office had a right to exchange these bags, and that the company had no right to levy any charge at parcel rates, as they had claimed, for the bags taken up and delivered at intermediate stations. At first we thought that this had practically settled the question, but we were mistaken. Very shortly afterwards a similar case occurred in England, and precisely the same objection was raised, and full parcel rates claimed for every bag taken up and delivered at intermediate stations. As the case occurred in England, we were about to bring it before an English court of law, but the solicitor of the Post Office thought it right to consult the law officers of the Crown, before instituting legal proceedings, and the law officers, although they had placed in their hands a copy of the decision of the Court of Session in Scotland, gave a very decided opinion that the Post Office could not claim to take up bags at intermediate stations, and therefore advised us not to institute legal proceedings, and in deference to their judgment no such proceedings were instituted, but the claims of the company were complied with. A third case occurred in Ireland, and there our solicitor, I presume, felt more confident in the justice of his case, and legal proceedings were instituted. But the decision given was a curious one. The company maintained, not that we had no right to exchange bags at intermediate stations, but that it never was contemplated that the power of sending a mail guard at the fare of a passenger should be exercised, except in cases where the Postmaster-General had previously put in force his powers under the General Act of Parliament, that is to say, except in cases where he had previously established a mail train under legal notice, the argument being that it was intended merely as a supplementary power. We have, therefore, had these various conflicting decisions, and the result has been that every successive Postmaster-General has hesitated to attempt to put in force a power which was subject to so much question. Very few cases have occurred lately in which the Post Office has made the attempt to use this power.

14,961. Under the decisions of which you speak, the only mode in which the Postmaster-General could exercise the power would be to send a porter to every station at which the bags were to be given up?—That would be the only mode of carrying it out.

14,962. That is to say, he would have to send almost as many porters as bags?—He would have to send as many porters as there were series of bags. A further case of the following kind has occurred, viz., the Postmaster-General has endeavoured to claim the same privilege which is conceded to the ordinary public; that is to say, he has asked companies to grant a yearly ticket for the guard at the same rate as is charged to the public; but in that case again our right to have the same accommodation as the public has been disputed. It is right I should admit, that one company at least has granted such a season ticket; but at the same time our right to insist upon it is doubtful.

14,963. What is the next point to which you desire to draw the attention of the Commission?—The next point in which I think the powers of the Post Office are deficient is, that we have no right, as we are informed, to *claim* a train devoted exclusively to the mails, nor have we any right to *claim* a train in which the traffic is restricted. This is a very important defect, because on many of the main lines of railway, the traffic is so large by the mail trains, that during a particular season for that traffic, great irregularity takes place entirely owing to the passenger and parcels traffic. Every year during the Scotch season, previous to the establishment of the limited mail train to Scotland, the irregularities in running the mail train to and from London and Edinburgh and Glasgow were very great; indeed sometimes as much as an hour and two hours were lost on the journey. In other cases, where there is an agricultural show, or a race meeting, or anything which brings traffic to the train, our mail trains (I am speaking now of the trains the hours of which are fixed under legal notice), are subjected to very serious delay, because the companies make ordinary return tickets available by the mail trains, and in fact attempt to carry by them a larger amount of traffic than is compatible with regularity. It seems to me, therefore, that it is very important that the Post Office should have the right of requiring, if it is prepared to pay for it, an exclusive train carrying the mails and officers of the Post Office only, and that it should also have the right, if it desires it, to claim a train the traffic of which should be limited either as to the number of carriages or the description of the traffic, such as limiting it to first-class passengers.

14,964. You are of opinion, in the absence of such a right, that it is impossible for the Postmaster-General to secure the punctual arrival of the mails at distant towns?—We can show, from the experience of the last 20 years, that it is quite impossible to secure regularity, so long as the companies can throw into a mail train any amount of traffic that the circumstances of any particular case may render convenient.

14,965. Care is taken, I believe, to report all irregularities; your officers report to you all instances of unpunctuality on the part of the trains, do they not?—Day by day, when irregularities occur, a representation is addressed to the railway company on whose line it occurs, and they are invited to offer any explanation they wish to be submitted to the Postmaster-General. But the explanations are frequently to this effect, that the traffic was so heavy on that day, that although they did their best to secure punctuality, they found it quite impossible to do so.

14,966. An impossibility of being punctual on account of heavy traffic is pleaded frequently, is it not, in cases where the Post Office is paying more than sufficient to cover the whole cost of the train?—In many cases it is so. Perhaps you will allow me to mention a particular case of the train from Edinburgh and Glasgow to London, leaving Edinburgh and Glasgow late in the evening. During the last year, the irregularities of that train were something terrible. The

E.J.Page, Esq.
20 Mar. 1866.

complaints from the public were very loud indeed, especially from the merchants of Liverpool and Manchester, whose letters frequently arrived too late for the morning delivery. I made inquiries into the subject, and found that the train was occasionally started from Edinburgh and Glasgow (or rather from Carstairs where the Edinburgh, Glasgow, and Northern trains join), with as many as 25 carriages, a load which rendered regularity simply impossible, and it was only after considerable negotiation with the companies, and after the traffic for the season had to a great extent subsided, and therefore action was less necessary, that I induced them to divide the train into two, and from that moment the delays very sensibly diminished.

14,967. In the case you have cited, viz., that of the Edinburgh and Glasgow mail, with every effort, and assuming that the mail train arrives punctually, the hour of arrival is necessarily so late as to make the delivery of letters in the morning, in time for business, a matter of extreme difficulty, is it not?—It arrives at Liverpool and Manchester, at which points the train ceases to be a mail train, two or three hours after the arrival of the London night mail; it is only, therefore, in case of tolerable punctuality that the delivery of important London letters can be delayed, so that it may include also those from Scotland.

14,968. I think the Post Office also encounters a difficulty with reference to the speed which it is entitled to demand, does it not?—There again our powers have been disputed, and they are still somewhat uncertain. The Act of Parliament states, that the Post Office shall be entitled to claim the same rate of speed which shall be settled by the railway companies for their own traffic, that is to say, that whatever may be the highest speed any company may adopt voluntarily, the Post Office may insist on the same speed being adopted for mail trains; but in a subsequent Act, provision is made for those cases where the highest speed adopted by the companies is very low, and it is provided that, in those cases where the speed adopted by the companies is *under* 27 miles per hour, the Postmaster-General may require a speed as high as 27 miles per hour, provided the Board of Trade does not certify that it is unsafe. But it has been asserted by railway companies, that the object of the Legislature in this subsequent Act was not to extend the right of the Post Office to claim, in certain cases, a speed of 27 miles an hour, but to limit our right to require any speed over 27 miles an hour. Again, in fixing the rate of speed the stoppages required by the Post Office frequently differ very much from those adopted by the companies for their first-class trains. In many cases, for instance, where a company has six intermediate stops the Post Office would be content with three, and yet it is doubtful whether the department could claim any shorter interval for the entire journey in consideration of that smaller number of stoppages. Again, in one case, an attempt has been made to thwart the Post Office in requiring a rate of speed as high as that of the companies' first-class trains, by altering the speed of the train *after* our notice was served, and before it came into legal operation. This I should state occurred a great many years ago, and it has never been repeated, but at the same time it shows that our right is so vaguely defined that we are subject to disputes. It has also been stated more than once, I think, but it was stated lately in a pamphlet by a very eminent engineer, that the Post Office forced railway companies into high speeds, the real fact being that the Post Office has no power to force any company at all. The Post Office can only follow the lead taken by the companies themselves, as I have shown, the law being that whatever they voluntarily do for themselves, they shall do for the Post Office.

14,969. You have pointed out various difficulties and defects, will you now proceed to state in what way you think that these difficulties and defects may best be met?—The Post Office has more than once endeavoured to deal with all the difficulties that have arisen from time to time. A Bill was prepared in the year 1853 by Lord Hardwicke when he was Postmaster-General, and it was introduced into Parliament, but very shortly withdrawn, owing, I believe, to the opposition made by the railway interest in Parliament.

14,970. The railway interest is very strong in Parliament, I believe, is it not?—Very strong indeed. But a further attempt was made by the Duke of Argyll, when he was Postmaster-General, and a very carefully prepared Bill was introduced. The object of that Bill perhaps may best be explained, if I am allowed to read the remarks made by the Duke of Argyll, in his annual report, on the subject of it.

14,971. What is the date of the report?—It is the fourth report which the Postmaster-General presented to Parliament in 1858, the Bill having been introduced into Parliament in the session of 1857. The Duke states this—"The defective state of the law regulating "the relations between the Post Office and the rail- "way companies has been viewed as a serious obstacle "to postal improvement by my predecessors for many "years past. In this view I entirely concur; indeed "my experience has satisfied me, that as the law now "stands, it is utterly impossible either to secure regu- "larity in the conveyance of the mails, or to have that "full use of the railways for postal purposes which the "public demands, which the department is anxious to "afford, and which would be beneficial even to the "companies themselves. Acting under this conviction, "I caused a Bill to be prepared, which, with your "Lordships' concurrence, was introduced into Parlia- "ment in the course of last session. In this Bill every "provision, however important, which appeared open "to reasonable opposition was carefully avoided. "Some of its clauses would have removed objections "to the present law which have been repeatedly urged "by the railway companies; and, taken as a whole, the "Bill certainly cannot fairly be represented as a measure "opposed to railway interests. Nevertheless, owing, "apparently, to misapprehension on the part of the "railway companies, statements were put forth on "their behalf which were almost wholly erroneous; the "Bill was strongly opposed by the railway interest "generally, and, the close of the session approaching, it "was withdrawn." That was the most carefully considered attempt that the Post Office has ever made to improve the legislation as to railway mail service.

14,972. That Bill is printed *in extenso* in the report from which you have just read, is it not?—It is; the Bill appears at page 46 of the appendix to the fourth report of the Postmaster-General, 1858, and is entitled "A Bill to make further Provision for the Conveyance "of Mails by Railways." The Duke of Argyll took a good deal of trouble and pains, both in the preparation of the Bill and in the proceedings connected with introducing it into Parliament; and, if you will allow me, I will read an extract from a memorandum which he himself prepared, to explain the various provisions of the Bill, the principles upon which they had been framed, and their objects.

"Under the present law (except in the few instances in which a guard is sent as a passenger) there is but one mode of determining the payment due to railways (of course failing agreement) for every kind of service, viz., that of arbitration. The result has been great delay in obtaining awards, diversity to an extent almost inexplicable in the amount of those awards, total uncertainty on the part of the Post Office as to what any given service will be found to cost, and lastly, as we think, an expense to the revenue in many cases not justly proportioned to the service rendered.

"At the time of the first railway legislation, it probably would have been easy to secure the conveyance of the mails at charges which, if not absolutely fixed, would have admitted of very limited variation. This course was actually adopted, and the advantage secured in reference to the conveyance of troops. Railways are compelled by law to render this service to the State at rates below those charged on the average to the general public. It is now, however, I fear, impossible to recover the ground which was lost by negligence at a more favourable time. But as the evils of the present system have been generally felt, and some changes have been recommended by a Committee of the House of Commons, and, indeed, have become

absolutely necessary, it may be as well to try at least a partial remedy.

"The principal features of the proposed Bill are these:—

"1. To enact a fixed tariff of charges in respect to all services performed by ordinary trains, thus avoiding the necessity of arbitration.

"2. To maintain arbitration for all *exclusive* and for all *special* services, but to lay down certain rules of computation for the guidance of the arbiters, and, as far as practicable, to confine them within a fixed maximum and minimum

"In respect to ordinary trains, the principle of substituting a fixed tariff for the present mode of settlement by arbitration, seems to have been approved by the Committee of the House of Commons which sat in 1854. They say, 'There is no great difficulty in fixing the price to be paid 'by the Post Office for any amount of service where the 'mails are carried by one of the ordinary passenger trains.'

"Discussion will of course arise on the figures of the proposed tariff for service performed by ordinary trains. It may be sufficient to explain here, that it is based upon the principle that the Post Office is to have no pecuniary advantage over the general public, that it is to pay at rates calculated upon the actual charges of the public traffic, with no other deduction than that which is due for regularity and continuity of service.

"In respect to all services rendered under the compulsory powers possessed by or to be conferred on the Post Office, we admit that no tariff absolutely fixed can be applied with justice to either party. The compulsory powers of the Postmaster-General may or may not act beneficially to the ordinary service of a railway company. The hours fixed may be unsuitable for general traffic, or, as much more frequently happens, either by their correspondence with other trains, by their speed, or by the undeniable popularity attached to the name of mail trains, they may be highly remunerative trains to the company, and it will be admitted that when the time is convenient, and the company have the full benefit of that convenience, no compensation ought to be paid for compulsory service. The following, therefore, is the principle of computation proposed for the guidance of arbiters.

"They are to start by calculating the additional cost of an *exclusive* train, that is to say, the gross additional expense to which a company would be put in running a train exclusively devoted to the conveyance of the mails. It so happens that although on this, as on every other point, very different estimates have been formed, there seems to be predominant authority for a valuation (assuming the minimum number of carriages), varying from about 1*s.* 1*d.* to 1*s.* 4*d.* per mile. This sum is calculated to include, besides the bare additional cost of running the train, an allowance for interest upon the value of the rolling stock so employed, and an allowance for its depreciation and for the injury done by the train to the permanent way; adding to the above rates 100 per cent. for profit, &c., the result will be a total mileage varying from 2*s.* 2*d.* to 2*s.* 8*d.*, and these are the maximum and minimum rates inserted in the new Bill.

"It is, however, provided that the maximum is not to limit the arbiter where a night police is required for the performance of such service.

"When the service rendered is not exclusive, that is to say, in the case of mail trains under notice, but allowed to carry passengers, the arbiters are to deduct a 'fair allow-'ance' for the traffic of the train. There is no attempt to specify what this allowance shall be. The result may, therefore, vary from the maximum (plus the cost of a night police) allowed for an exclusive train, down to the rates charged for an ordinary train, below which it cannot fall.

"In no case under the proposed Bill, except where a night police is required, would even an exclusive train (with the minimum number of carriages) receive more than 2*s.* 8*d.*, consequently in almost all cases a passenger mail train would receive much less, because such trains always convey some traffic, and for this a deduction would be made; whereas under the present system we pay in one instance as much as 4*s.* 6*d.* per mile for a mail train with a single mail carriage, from which train the company derives the whole traffic revenue in addition. This is the highest rate now paid, but on a great number of lines the rate is from 3*s.* to 3*s.* 9*d.* and 4*s.*"

It will be seen from that memorandum, that the Duke speaks of a maximum and minimum. These limits were introduced into the Bill when first prepared, but, acting under the wishes of the Lords of the Treasury to omit everything that could by any possibility, as they thought, raise an objection on the part of the railway interest, the maximum and minimum were excluded, when the Bill was laid before Parliament. The chief provisions were to this effect:—Powers were taken to demand exclusive mail trains, subject to an ordinary arbitration, without any maximum or minimum; powers were taken to use ordinary trains on giving 14 days' notice from the Post Office, leaving the company the right of altering or discontinuing the trains on giving seven days' notice to the Post Office. In that case payment by ordinary arbitration was retained. A third provision was to entitle the Post Office to send mail bags by any ordinary train at a fixed tariff of $\frac{3}{4}d.$ per mile for any weight not exceeding 1 cwt., and so on, in this latter case the company being at liberty to alter the trains without any notice whatever, but the Post Office to be required not to withdraw any service once established without giving the company seven days' notice. There were other provisions to meet some of the minor difficulties I have before referred to. That Bill was introduced into Parliament in the session of 1857, and after a great deal of opposition from the railway companies, the close of the session approached, and the Bill was withdrawn. It has never since been re-introduced.

E. J. Page, Esq.
20 Mar. 1866.

14,973. In speaking of the case of the North-eastern Railway, you mentioned two successive increases of payment under arbitrations which were not explicable by any corresponding increase of service; can you in any way account for that increase?—Under the second of the three awards I referred to, while the service had not increased in more than an infinitesimal extent as regards the number of miles, the weight of the mail had very greatly diminished, because, since the previous arbitration, an Act had been passed abolishing the compulsory stamp on newspapers, the result of which was to transfer from the mail bags to the trains of the railway companies parcels of a very large weight of newspapers. The extent of this reduction of weight may be illustrated by referring to the fact that the weight of the night mails leaving London after the commencement of that new law was diminished by no less than $2\frac{1}{2}$ tons per night, the whole of which diminution had gone into the traffic of the railway companies. Therefore, so far as regards the weight of the mail, there was a reason for a lower award rather than a higher award; and in looking for a cause for the increase actually awarded, I have not been able to discover any other cause than the following, which probably may help to explain it:—Under that arbitration, it was pleaded by the railway company's arbitrator, that the Post Office had deprived them of much of their parcel traffic, which is a very common plea with railway companies, and that plea was put before the umpire as a reason why he should give them a high rate of payment to compensate them for that supposed loss. That is the only reason that I can imagine why an umpire should have awarded any increase of payment at all; and, in the absence of any other reason, I can only conclude that the argument of the company's arbitrator had with him considerable weight. The umpires seldom give their reasons; and therefore in giving that as my opinion, I am merely making a guess at the probable cause.

14,974. The passing of the Act which abolished the compulsory newspaper stamp was accompanied, I think, by a lowering of the rates charged on book packets?—It was.

14,975. Can you explain to the Commission how it happened that one measure led to the other?—The abolition of the compulsory stamp rendered it necessary to make some provision for sending newspapers through the post office, and it was found that, as a rule, with one or two exceptions, the old red penny stamp on newspapers covered a rate not exceeding four ounces; and it was therefore thought desirable that an unstamped newspaper should pass through the post office at the rate of a penny for four ounces; but inasmuch as the reason for altering the law was that the law officers of the Crown or the Courts of Justice had found it impossible satisfactorily to define a newspaper, it will be evident to the Commission, that when the charge upon an unstamped newspaper of four ounces

E. J. Page, Esq.
20 Mar. 1866.

was fixed at 1*d.*, it became necessary also to reduce the charge on book packets to 1*d.* for four ounces; in point of fact newspapers are not, so far as the Post Office is concerned, distinguished from book packets; the charge is 1*d.* for four ounces of printed matter of whatever description.

14,976. Are you aware that it has been stated by Captain O'Brien, the manager of the North-eastern Railway Company, that the Post Office sends all its parcels by the railway without paying anything for them?—I have seen his evidence to that effect, and after the statement which I have just made with respect to the successive increases of payment to the company under successive awards, the Commissioners can, I think, very readily judge what ground Captain O'Brien has for that sweeping accusation. I may mention, in further refutation of his statement, that after the last of those awards had been given (that under which the company received the payment of 43,000*l.* a year), the Post Office entered into negotiations with the company with a view to a general contract, based on some reduction of that enormous payment, and after some negotiation, Captain O'Brien, on behalf of the company, agreed to reduce the total payment by 5,000*l.* a year, and to enter into a general contract for a term of years. I think that fact ought to be tolerably good proof, that Captain O'Brien did not at that time consider that the company were carrying our parcels for nothing.

14,977. But at the time the contract was made, I presume it was well known that many book parcels were put up with other portions of the mail?—Very well known indeed.

14,978. Then, in brief, you do not concur in the accuracy of Captain O'Brien's statement?—I think it is a sweeping accusation supported by no proof whatever, and I certainly cannot give my assent to it.

14,979. Nevertheless, I presume you are quite ready to admit that railways have been the means of enabling the Post Office very greatly to extend the facilities for the transmission of mails throughout the kingdom?—There is no doubt that railways have afforded very great advantages indeed to the Post Office for the development of correspondence. Perhaps the most important of those advantages has been the increased rapidity of transit, the result of that increased rapidity being, that Edinburgh and Glasgow are now, for postal purposes, as near to London as Birmingham and Bristol were in the mail coach days. That, no doubt, has been a very important benefit which railways have conferred upon the Post Office. Another important benefit is this, that by sorting letters in carriages on a line, which, of course, was impracticable under the coaching system, delays at certain points for sorting letters have been avoided. That has been a further indirect means of the saving of time, and it has also been a means of simplifying the system of the Post Office as regards its accounts. There is no doubt, also, that the Post Office is indebted greatly to railway companies for the facilities of establishing more frequent postal communications, and for the means, therefore, of serving the public more satisfactorily than they could have been served without those facilities; and I have no doubt that the advantages that I have spoken of above have tended very materially to increase the number of letters passing through the Post Office.

14,980. So far as the public are concerned, the facilities afforded by railways have been obtained at a diminished cost as compared with coach conveyance; does the same remark apply to the mail service?—Quite the contrary; the cost to the Post Office of performing its service has very materially increased; and where the public have obtained an accommodation for themselves at a diminution of cost, the Post Office in a similar case has had to pay very much more.

14,981. (*Mr. Horsfall.*) Has the increase of cost been in proportion to the number of letters carried?—The increase of cost has certainly not been proportionate to the number of letters carried; nor is there, I think, any reason why it should be.

14,982. (*Sir R. Hill.*) But do the letters form the bulk of the mail?—The letters form only about 30 per cent. of the whole mail as to weight.

14,983. Then you say that the Post Office has not, in common with the public, obtained the use of railways at a smaller cost, keeping in view the increased weight of the mails as compared with what they were 25 years ago?—Certainly I do.

14,984. Weight for weight, you consider that the Post Office is paying more now than it did under the old system of stage coaches, or at all events if it is not paying more, that its expenditure has not been reduced to the same extent that the expenditure on the part of the public has been reduced for the conveyance of goods, and parcels, and passengers?—I have no doubt whatever that the increase in the charges has fully kept pace with the increase of weight, and I am quite of opinion that the Post Office has not obtained a diminution of cost to the same extent that the public have done under similar circumstances.

14,985. Have you ever given much attention to the subject of conveyance of small parcels by the Post Office?—My attention was given to that point many years ago. In the report which I have already spoken of as having been written by me to the Postmaster-General in reply to the remarks of Mr. Robert Stephenson, the peculiar facilities of the Post Office for the conveyance of small parcels are specially shewn.

14,986. Will you explain to the Commission what is meant in the Post Office by a parcel, as distinguished from a book packet?—At present, anything that does not come under the description of a book packet can only be conveyed by post, provided it pays full letter rates. Therefore, except for books, the charges now made by the Post Office for what the railway companies term *parcels*, are in fact at the rate of 2*s.* 8*d.* per pound, which is the same charge as for letters.

14,987. But it has been the desire sometimes of the authorities of the Post Office to establish if they could in co-operation with the railway companies a parcel post, with a view of affording to the public the means of transmitting any article by the post which could be carried without risk to the general correspondence in enclosed packets, that is what is meant by a parcel post, is it not?—Yes. That is a subject which has often been discussed at different times during the last 10 years in the Post Office.

14,988. It being intended that such parcels should be charged at a lower rate than the letters, but that they should be subject, as the book packets are, to possible delays in their despatch and delivery?—It has generally been considered that something of that sort should be the basis of a parcel post, if established at all; but no definite plan has ever been drawn up.

14,989. Can you state why the measure has been delayed so long?—The question has been ventilated over and over again by the public press, and by discussions at the Society of Arts; but whenever any indication has arisen of the probability of the Post Office taking up the question, serious indications have at the same time been shown of a very strong and combined opposition on the part of the railway companies, and up to the present moment, no negotiations have taken place between the department and the railway companies, with the view of considering whether such a service as a parcel post might not be established to the mutual benefit of both parties. I have always believed, that if such a service as that was established, it might be made as profitable to the railway companies as to the Post Office, and instead of being a loss to the companies, might be a source of considerable increase of revenue.

14,990. You spoke of the Society of Arts discussing the question some years ago. I think a committee was appointed by the Society of Arts to report upon the subject of a parcel post, was there not?—There was.

14,991. And they made a report recommending that a parcel post should be established by the Post Office?—A very elaborate and careful report of that kind was prepared, and in that report the recommendation you speak of was made.

14,992. Can you tell how long this is since?—The report I refer to was published in 1858.

14,993. Do you recollect the reasons assigned by the committee of the Society of Arts for the establishment of a parcel post?—The gentleman by whom that report was prepared adopted many of the reasons which had been given by me in the report to which I have already referred, as well as much of the evidence given before a Select Committee of the House of Commons. It was shown that the service of the Post Office in conveying packets of books, &c., limited as it was, consisted almost entirely of packets for the conveyance of which the arrangements of the railway companies did not make provision, that is to say, parcels going to small villages and over a variety of lines, over which, in many cases, no through booking for small parcels existed; and therefore, that a small parcel service, through the Post Office would be, as it were, supplementary to the parcel service of the railway companies, and instead of interfering with it, would be a sort of auxiliary to it. The reason why the Post Office has thought that peculiar facilities were offered for a parcel post, is the wonderful organization of our machinery, that is to say, the immense facilities we have for the collection and delivery—facilities with which the railway arrangements cannot for one moment compare. I find by a return which has lately been prepared that there are throughout the United Kingdom about 16,000 post office receptacles for letters; and it is well known that there is scarcely a village now without a post office, and even scarcely a hamlet without some organized means of communicating by post with some head post office. It would be almost impossible for any railway company, or the combined railway companies, to perfect an organization so complete as that of the Post Office. It was mentioned some years ago as an illustration of the extraordinary facilities offered by the Post Office that the North-western Railway Company issued a circular to their shareholders, in which a complaint was made of the undue competition of the Post Office with their parcel traffic, and that these very circulars were sent to the company's shareholders through the Post Office, not merely to small villages, but even to Liverpool, to which the company's own trains would have carried them without any cost whatever; the explanation, of course, being that the company could not even deliver them for the same money that the Post Office would charge for conveyance and delivery.

14,994. It was a report of the committee to the company, forming a pamphlet of considerable size, was it not?—It was a small pamphlet. It was called "The "Report of the Committee of Consultation."

14,995. The scheme that many years ago was considered in the Post Office, and that which is recommended by the Society of Arts for a parcel post contemplated a uniform charge irrespective of distance, did it not?—It did.

14,996. The charge increasing only according to the weight of the parcel, upon a principle similar to that which has been applied to letters; was it not so?—It was.

14,997. Then the adoption of such an arrangement would have given the public the advantage of knowing, on the despatch of the parcel, exactly what would be the cost to its destination?—It would.

14,998. The public does not enjoy that advantage now in sending a parcel by a railway company unless it is delivered upon the same railway as that on which it is received?—It does not in all cases. I believe that you can, for instance, by taking a parcel to Euston Square, ascertain what the whole charge for conveyance would be to a town in Scotland; but such a charge could not, I believe, be elicited from the company's books sold to the public, and could only be ascertained by proceeding yourself or sending a servant to the Euston Square station, or to one of the company's receiving houses.

14,999. It depends on whether the companies have what they call through rates for parcels, does it not?—It would depend entirely upon that.

15,000. Now, supposing a parcel to be sent from a town upon a railway addressed to a village remote from a railway, then, though there should be a through rate to the nearest railway station, I presume that it would be impossible to ascertain what would be the total charge for that parcel?—It would be impossible to ascertain the total charge, and it would be equally impossible to pay the total charge. Something must be left for whatever the charge may be of the ordinary carrier to whom the parcel is handed after arrival at the station.

15,001. And that portion of the cost would in many cases be an arbitrary charge?—I believe so.

15,002. Then, if a parcel post were established by the Post Office in co-operation with railway companies, a small parcel dropped into any one of the 15,000 or 16,000 receptacles for parcels would be delivered practically at any house in the kingdom?—It would.

15,003. And judging from what you have observed during your long service in the Post Office, is it your opinion that an arrangement of that kind, which would render it easy for the public to send at a small cost a small parcel from any town or village to any other town or village, would cause a great increase in the number of parcels distributed?—If the charge were not excessive I should be prepared to find that an enormous number of parcels would be sent, which in many cases are not now sent at all.

15,004. Under fair arrangements between the post office and the railway companies, would not that great increase be beneficial to the companies?—It appears to me that it might act very beneficially with regard to their revenue.

15,005. The total charge in such a case should be divided in certain proportions between the railway companies and the post office?—I do not think it would be very difficult to devise means, by which the whole charge levied and collected by the post office should afterwards be divided according to a certain principle which should be equitable to both parties, as well as profitable to both parties.

15,006. The service performed by the post office would be, first, the receipt of the parcel, then its conveyance to the nearest railway station; and after it had been carried by the railway companies as far as their lines extended in the proper direction it would be delivered by the post office, possibly after a further conveyance by a post office cart, or by a post office messenger. I presume that any fair division of the total charge upon the parcel should have reference to the service performed under ordinary circumstances by each party, that is to say, a sort of average estimate of the service performed by the post office, and of the service performed by the railway companies?—No doubt some principle of that kind could be adopted. It would, of course, be a mistake to suppose that the whole conveyance would be performed by the railway company, as many of these parcels would have to be carried by rural post messengers, by mail carts, and by coaches, for which the post office makes payments, and, therefore, the allowance would have to be divided so as to yield a fair profit to the railway companies for their portion of the conveyance, and a fair profit to the post office for that portion of the conveyance which devolved upon them, as well as for collection and delivery.

15,007. As a means of giving the Commissioners some idea of the probable amount of the service to be performed in each case, I would ask you to state the daily mileage of the railway mails, the daily mileage of the post office coaches and carts, and the daily mileage of the post office foot messengers?—I cannot give that for the present year, but the last record, such as you describe, was issued in the Annual Report of the Postmaster-General for the year 1862. In the return which appears in that report the following results are shown as to the mileage; the number of miles per diem over which mails were conveyed by railway in the United Kingdom was 49,700; the number of miles per diem over which mails were conveyed by coaches, omnibuses, mail carts, &c., (not including the rural post messengers, who travel over a very large mileage besides,) was 33,300, being about two-thirds of the mileage over which mails were conveyed by railway.

E.J.Page, Esq.
20 Mar. 1866.

15,008. What is the mileage of the rural messengers?—I have no record of that, but I should not be surprised to find that it was nearly as much as the railways, coaches, and mail carts put together.*

15,009. Then you think that arrangements might be made between the post office and the railway companies which should fairly divide the postage of these parcels without going into a detailed estimate in respect of each?—Unquestionably; I feel confident, if both parties went heartily to work with a sincere wish to arrive at a settlement, that arrangements could be devised which would give satisfaction to the Post Office, would be profitable to the railway companies, and would afford the public a very important accommodation. I wish to state, that I am now giving only my own personal opinion, I am not prepared to say that either the Postmaster-General, or the Secretary to the Post Office concur in my views; I wish it, therefore, to be recorded, that they are only my own views, and that I am not authorized to say that they are the views entertained by the Post Office.

15,010. Do you happen to know whether the establishment of a parcel post formed part of the scheme of the Post Office improvement, which I submitted to the public many years ago?—It did form a part of it.

15,011. (*Lord Stanley.*) The difficulty I understand at present is to get anything like a principle on which to understand what eventually should be paid to the railway companies for mail service?—That is the chief difficulty.

15,012. Hitherto the practice has been to arrange it simply by arbitration, without leaving them any right, but leaving it to arbitrators or to an umpire, if they disagree, to settle it on such terms as they may think fit?—Yes, by arbitration, undefined and unregulated.

15,013. And of course the result has been a very great discrepancy in the decisions which have been given?—The result has been, as I have endeavoured to show, a very great discrepancy between awards and payments for services very nearly, if not quite, similar.

15,014. The substance of what you have come here to tell us is this, that you think an arrangement might be made by which some ground of principle should be laid down so as to prevent those discrepancies in future?—Exactly.

15,015. Do you anticipate any material saving to the Post Office on the whole?—Believing, as I do, that the present system of arbitration has resulted in payments much higher than we ought to make for railway conveyance, I certainly should anticipate that any attempt to define and regulate arbitration would lead to somewhat lower payments for mail trains under legal notice.

15,016. But there have been cases, have there not, in which the railway companies in their turn have complained of not receiving sufficient payment?—I believe there is scarcely a railway company in the kingdom that would not come forward to say that they were insufficiently paid.

15,017. (*Sir R. Hill.*) Have you not always found new railway companies very anxious for the conveyance of the mails?—We frequently find, so great is their desire to obtain the conveyance of the mails, that they use very great efforts through influential parties to secure the conveyance.

15,018. (*Capt. Galton.*) Is not the reason of the great difference of opinion between the Post Office and the railway companies, as to the remuneration for the services performed, owing to the fact that the railway companies consider that they should receive a sum which would pay interest on the capital they have expended in the construction of their railways, and which should cover all their general charges, and give them a fair profit, where as the Post Office has held that the price to be paid should be founded solely upon the cost of the train?—There is no doubt that that is one reason which has led the different umpires to award different sums; they have taken into consideration the very circumstances which you have described.

15,019. Then you would wish that Parliament should lay down the rule, that the companies should only be paid for the cost of the train with a remuneration besides, as I understand you?—The Post Office, as I understand it, would wish in that respect to be treated precisely the same as any large trader would be treated, if he applied to a railway company for a certain special service. I think it is beyond a doubt, that if any large trader went to a railway company, and said, "I want a "train to run every day in the year at a certain time, "what will you run that train for me for, and carry my "goods," the company would be quite satisfied to get, in return for their services, the whole outlay they were subjected to, *plus* a reasonable profit.

15,020. (*Sir R. Hill.*) Are you aware that it has been stated in evidence before this Commission repeatedly by railway managers that when such an application is made their rule is to ascertain the additional cost to the company, and then add 100 per cent. for profit?—I was not aware that that had been stated.

15,021. Have you not stated, in reading the Duke of Argyll's memorandum, that that was precisely what he had in view, namely, that the actual cost should be ascertained, and 100 per cent. added for profit?—That was the Duke of Argyll's view.

15,022. Therefore, the Post Office has not attempted to restrict the payment of the railway companies to the mere cost of running the train?—The Post Office has never wished to be placed on a better footing than the public at large would be, if they entered into arrangements with the railway companies for any amount of service that they might require. We believe that the result of arbitration has been to place us at a great disadvantage as compared with the public at large, and that if we could be left completely unfettered so as to arrange as private individuals with railway companies, that we should get our service performed at rates which are much lower than those that we have been compelled to pay as a public department, under arbitration.

15,023. (*Capt. Galton.*) Is it not because you are not in the same position as the public at large that you have to pay that extra sum? You have the power of ordering the train to run at a certain time, but if a private individual went to a railway company the railway company would fix its own time for the running of the train; therefore, to that extent, you are in a totally different position, are you not?—I think if a private trader went to a railway company, he would specify the particular service that he wanted the railway company to perform, which is, in effect, what the Post Office does. The Post Office say, we require a certain service, naming and describing it fully in the notice. That certain service subjects the company to a certain amount of extra expense, in many cases small, and in many cases large; but in estimating the payment for that service, the cost to which the company have been subjected by the performance of it appears to be thrown aside, as it were, and a general argument is attempted to be used, that the Post Office for its service should renumerate the company for any unsatisfactory state of things as regards the general traffic of the company.

15,024. I think you stated that the highest mileage rate you had to pay was 4*s.* 6*d.* per mile?—The highest mileage we have ever paid as the result of an arbitration, is 4*s.* 6*d.* per mile. But we have paid more than that, and we do at the present time pay more than that, for the service on the Chester and Holyhead line, but that has always been viewed by the Post Office not as mere payment for railway mail conveyance; I believe it is about 4*s.* 10*d.* a mile.

15,025. Was not that arrangement made at the time the Menai bridge was constructed?—It was an arrangement made by the Lords of the Treasury, who, I believe, intentionally gave a very high payment as an inducement to the company to proceed with works which in themselves would not have been profitable.

15,026. (*Sir R. Hill.*) That was for a term of years?—That was for a term of years, certainly.

15, 027. Which term has expired long ago?—Before

* Let me correct myself by saying, that I now observe that, in the same Annual Report, the number of miles travelled daily by rural post messengers is given as 72,600, being very nearly as high as I had roughly guessed.

the expiration of the term, arrangements were made by which, on its expiration, it should be continued and made dependent on the continuance of the Irish mail contract.

15,028. (*Capt. Galton.*) Then it was somewhat in the shape of a subsidy to the company for making a very expensive road to Ireland?—It was, and therefore we have never thought it fair to quote that as being an illustration of a heavy payment for mail service only.

15,029. What is the price which the Post Office now pays for the special train which it runs from London to Bristol, and Bristol to London?—I can give it very nearly indeed. The contract with the Great Western Company was based upon an award fixing the rate of payment for different services. The total sum was calculated, and was adopted as the annual payment under the contract. Under that arbitration, the sum awarded for the night mail train from London to Bristol was 3*s.* 9*d.* a single mile.

15,030. Do you think that any individual who applied to a railway company to run a special train could obtain that train at so low a rate as 3*s.* 9*d.* a mile?—I should be very much astonished if he did not, if he required a service daily, because I believe that that payment gives the railway company a very considerable profit.

15,031. (*Sir R. Hill.*) According to the estimate made by Mr. Robert Stephenson of the actual cost of running a train, what would be the profit on such a train as that which we are speaking of?—The profit would be about 200 per cent.

15,032. (*Chairman.*) Do you know what is included in Mr. Robert Stephenson's estimate; is maintenance of way included in that estimate?—I believe it is.

15,033. Is it not the fact that the average cost of running a train of all the trains in the country is 2*s.* 6*d.* per mile; that is, dividing the expenditure of all the companies per train mile?—I have always understood that 2*s.* 6*d.* represents about the average cost of running a train. Mr. Stephenson's estimate, I believe, was the bare additional cost, supposing a certain state of things exists; say there are six trains running on a certain line during the day, then to add a seventh train would subject the company to an additional expense at the rate of about 1*s.* 3*d.* per mile.

15,034. (*Sir R. Hill.*) But the average cost of running a train would far exceed the cost of running an engine and a single carriage for the Post Office, would it not?—Of course it would very largely exceed that, because the average cost must include the total expenses of the company under all heads of management, and everything else; whereas if six trains are running on the line and a seventh is added, it is more than probable that a large number of the ordinary expenses of the company would in no way be increased.

15,035. (*Capt. Galton.*) Do you not consider that the Post Office should pay any proportion of those ordinary expenses?—I do not, provided a fair sum for profit is added to the bare additional cost.

15,036. (*Sir R. Hill.*) Still, the principle proposed by the Duke of Argyll, of ascertaining the additional expense and adding 100 per cent., would have included, if adopted, a proportion of the fixed expenses?—It would not directly include them. It would have repaid the company all the expenses that they were subjected to, of every kind, under any head that they could show an additional expense to have been incurred, and over and above that, it would have given them 100 per cent. for profit.

15,037. Sometime ago the Post Office obtained an estimate from the Board of Trade of the actual cost of running a train, did it not?—Some years ago, at the time when a tariff of rates for mail service was under consideration, the Post Office wished to be fortified with the opinion of the Board of Trade, as to what should be fairly considered to be the bare additional cost of running a train, and in the report received from the Board of Trade at the time,—I am speaking from recollection,—I believe it was stated, that the bare additional cost of running a train and a carriage would be represented by a rate varying from 1*s.* to 1*s.* 2*d.*

15,038. Among the contracts existing between the Post Office and the railway companies, there are several, are there not, which contain authority on the part of the Post Office to require an additional train at a certain fixed rate?—Nearly all the recent contracts provide not only for the continuance of the then existing service, but for any increase of service that the circumstances of the case may call for during the continuance of the contract.

15,039. Giving the Postmaster-General a right to require an additional train to be run at a fixed time at a speed within the limits prescribed by the Act of Parliament?—They usually give the Postmaster-General a right to require any additional train that he might think proper.

15,040. Can you state what are the rates of payment provided for under these contracts for such special trains?—The exact conditions of the contracts vary considerably. In many cases, it is provided that all additional mail service by trains under fixed notice shall be paid for under arbitration, but it has been found that many companies dislike arbitration. It is dilatory, unsatisfactory, and troublesome; and instead of providing that such additional trains shall be paid for under arbitration, many companies have, at the time of making the contract, agreed upon a fixed rate for additional trains. I may mention a few of the companies who have agreed to contract to run any number of additional mail trains at fixed rates. The London and South-western Company agreed to establish any additional mail trains at a rate of 3*s.* per single mile. That would apply to a train running in one direction only, so that it is quite possible that for that 3*s.* per mile, the company might have to run the distance twice over.

15,041. Is it not more than possible, is it not highly probable—almost certain?—Railway managers generally contrive to utilize a return engine in some way, but in many cases it would be impossible so to utilize the engine, and in these cases the additional payment would, at the rate quoted, be represented by 1*s.* 6*d.* a mile. But on other lines, we have payments very much lower than that. For instance, under the contract with the Highland Company, any additional mail train can be established upon payment of 1*s.* per single mile. Under the contract with the North-eastern Company, which is Captain O'Brien's company, any additional mail train may be established at a payment of 1*s.* 3*d.* per single mile. On the Lancashire and Yorkshire line, under the original contract, any additional mail train might have been established at the cost of 1*s.* per single mile, and even under the renewed contract, made some two or three years ago, that payment has been fixed at only 1*s.* 6*d.* per single mile. On the North British line, an additional mail train may be established at the rate of 1*s.* per single mile. All those rates are for trains running at fixed hours.

15,042. (*Capt. Galton.*) They run at hours named by the Postmaster-General?—Yes; but on the North-eastern line, for instance, the company undertake to run occasionally special trains, if the Postmaster-General shall require them, owing to any mail bags being left behind, or any loss of junctions. An occasional special train may be called for, and the payment for such occasional special train is fixed only at 2*s.* per single mile.

15,043. (*Chairman.*) Do you know what is the usual rate that railway companies charge other parties for special trains?—I believe it varies from about 5*s.* to 8*s.* per single mile; but it is well known, that the rates to the public are purposely fixed at a prohibitory amount, it being desirable that railway companies should not be subjected to the disruption of their service caused by a frequent demand on the part of the public for special trains.

15,044. Have you frequently availed yourself of the power you have in certain cases of calling upon railway companies to run additional trains?—Very seldom indeed, except in the case of the two lines by which

E.J.Page,Esq. 20 Mar. 1866.

the foreign and colonial mails are conveyed to and from London; I speak of the South-western line and the South-eastern line. On the South-western line we use a great number of special trains, dependent on the arrival of the mail packets; and those trains running at any time of the day or night are paid for at the rate of 3*s.* 6*d.* per single mile. On the South-eastern line, we use a special train on the 26th of every month, by which the Australian and Indian mail is conveyed. That train is run always on the 26th of the month, and it is paid for at the rate of 4*s.* per single mile. On the other lines I can mention, the employment of special trains is very rare indeed, probably not more often than once a year.

15,045. (*Sir R. Hill.*) The trains which you are now speaking of are trains in one direction?—They are.

15,046. And occasional trains?—Occasional trains.

15,047. I presume it would make a great difference as to the rate which the company would demand from any private individual, as to whether the trains should be occasional, or whether they should be daily, and whether they should be in one direction or in both directions?—I should imagine that would make a very great difference in the amount of payment which they would claim from the individuals who applied to them.

15,048. All the principal mail trains are in both directions, and run daily. Is that not so?—It is very seldom the case that a mail train under notice is not required to run in both directions. There are some cases, but those cases are exceptional.

15,049. (*Earl of Belmore.*) Is it not the fact, that in the case of certain contracts between the Post Office on the one hand, and railway and steamboat companies on the other, that power is reserved to the Post Office to inflict fines in case of the service not being within the specified limits on any day of the service?—There is no case of a contract with a railway company in which fines are provided for. The mail packet service does not come within my department; but I happen to know, that in the case of the Dover and Calais service, provision is made not only for fines for the time being exceeded, but for premiums when the time is not exceeded.

15,050. Is there no fine in the case of the Irish mail with regard to the contract with the North-western?—The intention of the Treasury, when that contract was negotiated, was that the service should be performed subject to fines, but owing to a dispute between the contractors and the Government, as to whether certain piers which were to be completed at Holyhead have or have not been completed, the Post Office has never felt itself in a position to enforce those fines, and up to the present moment they have been inoperative.

15,051. Would those fines have been enforced against the steamboat company or against the railway company?—Against the two combined. The service was taken as a whole, and the fines would have been levied on the excess of time over the journey as a whole, by land or by sea, from London to Kingstown, and *vice versâ*.

15,052. (*Mr. Horsfall.*) Does the Post Office make any stipulations as to the stations at which these railway companies shall take in passengers?—The Post Office has no power to make any stipulation whatever with regard to the passengers. All that the Post Office can do by notice, is to fix the stations at which the train shall stop, and at any of the stations the company can take in whatever traffic they please.

15,053. (*Mr. Gower.*) What remedy have the Post Office when a train under notice is unpunctual?—Theoretically our remedy is to enforce the penalty of the bond. Every railway company by law is bound to give a bond for the due performance of the service, but the difficulty of enforcing that bond would be so great, on account of the difficulty of proving what the real cause of delay was, and the ease with which the company could dispute the cause assigned, that in no case has any penalty provided for in a bond ever been enforced by the Post Office.

15,054. Then the mere fact of delay would not be sufficient to enforce the penalty of a bond?—It would not.

15,055. (*Chairman.*) Is the form of the bond regulated by Act of Parliament?—I believe not; the form of bond is, I think, settled by the solicitor of the Post Office, but whether the solicitors of the companies are consulted, I do not know.

15,056. (*Capt. Galton.*) Is it the same in all cases?—I am not sure that it is; I believe it is very nearly the same, but of course I need hardly say the amount differs according to the amount of the service and the length of the line.

15,057. (*Sir R. Hill.*) Practically it is a mere form, is it not?—As I have shown, it is a mere form; it is a mere form, because in numberless cases we should have been very glad to have endeavoured to have secured punctuality by enforcing the bond, but we have never been able to see our way to do it successfully.

15,058. With regard to the fines which are provided for in the contract for the Irish mail service, the companies concerned voluntarily entered into an agreement to pay those fines, did they not?—The companies voluntarily entered into an agreement to pay very heavy fines, at the rate of 1*l.* 14*s.* for every minute of delay, and the heavy subsidy paid them under the contract had reference to that contingency, that is, to the possibility of their having to pay the Post Office fines on occasions when, with every exertion on their part, they found themselves unable to avoid a loss of time.

15,059. Is there any doubt whatever that the company received a much larger subsidy in consideration of those fines than they would otherwise have obtained?—I have no doubt whatever in my own mind that the subsidy had a special reference to the heavy amount of penalty; but the contract was negotiated at the Treasury, and not at the Post Office, and therefore I can only express my opinion.

15,060. Then the actual result would appear to be this, that the companies have obtained a large subsidy in consideration of the fines, but owing to peculiar circumstances they have never paid any fines?—That is precisely the state of things.

15,061. As some guide to the determination of the amount paid by the companies in respect of fines, and some other considerations, are you able to state how the actual subsidy compares with that which was stated, on behalf of the companies before a Committee which sat upon the question of special arrangements for Irish mails, to be sufficient for the service?—I have no recollection at the present moment what amount they stated on that head would suffice.

15,062. Are you aware that the sum actually paid is many thousands a year beyond that sum which was stated to the Committee to be sufficient?—I know it is higher than the amount which they originally stated, but I do not know by how much.

15,063. (*Capt. Galton.*) Have you any mode of enforcing greater punctuality to suggest to the Commission?—I have always considered that there would be no difficulty practically in framing a contract, by which the companies should on the one hand obtain a premium whenever the time within which they contracted to perform the service was not exceeded; and on the other hand, pay to the Post Office a penalty whenever it was from any cause exceeded. I believe that such an arrangement as that might be made a very workable arrangement; and that if the company made exertions to maintain regularity, it might also prove to them a very profitable arrangement.

15,064. (*Sir R. Hill.*) Are you aware that an arrangement of that kind was actually offered some years ago to the principal companies conveying the mails?—It was offered to nearly all the principal companies in the kingdom, and it was accepted by only one of them. It was actually put into operation, and during the time it remained in operation, that company did obtain a very considerable amount of profit from the premiums paid to the company.

15,065. From the excess of the premiums over the fines?—Yes; practically they were very seldom fined, and as a rule they obtained the premium.

15,066. Are you aware that when the offer was made to the companies, it was accompanied by an offer to open the award, if any company should desire it to be opened, with a view to the sum to be paid for the service being determined with reference to this arrangement of fines and premiums?—I recollect well, that that condition was specially proposed to the companies as an inducement to them to accede to a system of fines and premiums.

15,067. And all the companies, with a single exception, refused to accept the arrangement?—They did.

15,068. (*Chairman.*) Do you think the principles of the bill that was introduced by the Duke of Argyll in 1857 offered the best remedy that can be found for the grievances which in your opinion the Post Office have to complain of?—No; I do not think they would have provided the best remedy for those grievances, because, as I mentioned, many of the provisions originally intended were struck out at the last moment, in order to disarm the opposition of the railway companies. There is no doubt that that bill, as it was proposed to Parliament, would have afforded a material improvement as regards the law between the Post Office and the companies, but it would not have afforded all the improvement desired, because it provided still for continuing the ordinary arbitrations unrestricted.

15,069. (*Sir R. Hill.*) Do you think there would be any difficulty in framing a tariff which should be applicable to all possible contingencies?—I have never myself thought that it would be quite fair, either to the Post Office or to the railway companies, to provide for the payment of every description of service by a tariff. I have always considered, that as regards mail trains under notice, it would be far more satisfactory to define the principle upon which the arbitrators and umpire shall proceed in making their calculations; but as regards ordinary train service, the service which is in no way controlled by the Post Office, I can see no reason whatever why a tariff of charge should not be fixed, the same as it is fixed for the conveyance of troops or the conveyance of police, that tariff being of course regulated with reference to the weight of mails conveyed.

15,070. There being tariffs for the conveyance of ordinary passengers, for the conveyance of parcels, for the conveyance of goods, and so forth?—Yes; but in the case of parcels and goods, I believe a maximum is fixed, and in the case of the Post Office, I do not see why an absolute rate should not be fixed.

15,071. The Post Office, I presume, would be very glad to pay even at the highest rate required for goods, would it not?—The Post Office would be only too glad to make any payment to the companies, based upon such an estimate as that.

15,072. (*Chairman.*) Do you find that railway companies generally base their claims as to their rate of payment on the fact of the Post Office carrying book post?—That does not generally come out at the time of negotiating with the railway companies; that argument has usually been made use of at the time when the case is being laid before the umpire. The companies know it is useless to plead that in negotiating with the Post Office; but when they have to lay their case before an umpire, his mind may possibly be influenced by the argument, and companies usually endeavour to turn it to the best account.

15,073. (*Mr. Horsfall.*) It is a very legitimate argument, is it not, on behalf of railway companies?—It appears to me to be the most unjustifiable argument that I have ever heard of.

15,074. In what way?—In the first place, I know no reason why railway companies have any special claim to the conveyance of any packets or parcels which the Post Office is able to carry, seeing that the greater number of lines were made long after the introduction of penny postage.

15,075. (*Capt. Galton.*) Have not railway companies always provided for the carriage of parcels in all their Acts of Parliament?—I am not quite conversant with that subject. I have always understood that certain maximum rates were fixed for the conveyance of parcels.

15,076. Therefore that would imply that Parliament intended they should convey parcels?—Clearly; but it does not imply that the Post Office shall not convey parcels also.

15,077. (*Sir R. Hill.*) It does not imply that companies have any monopoly in the conveyance of parcels, does it?—It appears to me that no argument of that kind can be deduced from it at all.

15,078. Do not the Railway Companies Acts fix the maximum and minimum charges for passengers and goods?—Certainly.

15,079. Do the Railway Companies claim the exclusive privilege of carrying passengers and goods?—I believe that even railway companies have never gone to that extent.

15,080. (*Capt. Galton.*) Is that quite a case in point; is it not the fact that the Post Office calls upon railway companies to carry parcels for them, and the railway companies carry those parcels as packed parcels at a very low rate, upon which the Post Office levy a much higher rate when they come to their destination?—The railway companies convey whatever is in the mail bag, so-called parcels included, as a portion of the mail; but inasmuch as the payment made by the Post Office for the conveyance of the mail very far exceeds the rates of payment charged by the companies for newspapers, parcels, or packed parcels, there is no doubt they get a higher payment for carrying them as part of the mail than they would get for carrying them as part of a packed parcel.

15,081. Are you not aware that many railway companies refuse to carry packed parcels?—I have seen from the public press that great disputes have arisen upon that point, but I have heard that the final decision has been against the companies, and in favour of the packed parcels carriers.

15,082. They can charge a much higher rate for their packed parcels than they charge for their goods?—I believe on those packed parcels they can charge the maximum rates allowed for any description of parcels; but the payments made by the Post Office for the mail very far exceed that maximum rate. Therefore I should argue, that the companies get an advantage by carrying the so-called parcels as part of the mail, instead of carrying them as packed parcels.

15,083. Do the railway companies obtain a sum according to the weight of the mail?—There is no doubt that the weight forms a very important element of consideration in fixing the payment. Of course the weight is not the only thing taken into account when an additional mail train is required.

15,084. But when the Post Office runs a mail train it can put any amount of weight it likes into the mail?—The Post Office in that case pays for running a train, and for a certain amount of accommodation in that train. Whatever space is provided, and has been arbitrated upon, that space may be filled with the mail if necessary, but it very seldom is filled.

15,085. (*Sir R. Hill.*) Does not the Post Office in your opinion pay an excessive sum in consequence of that necessarily indefinite advantage that it requires of sending any amount of mail that can be placed within the prescribed limits?—I have no doubt we do practically pay for a much larger space than we use.

15,086. Would not the Post Office be very glad to enter into arrangements with the companies for the conveyance of letters, and letters only, and then pay in addition to that the same charges that the companies make to booksellers and others for the conveyance of their packages and books?—I should think that the Post Office would be very glad to proceed on such a principle as that.

15,087. Would it not in all probability save many thousands a year if you could so arrange matters?—I have no doubt that if our payments were calculated upon such a principle, they would be very largely reduced, probably to the extent of many thousands a year.

E.J.Page, Esq.

20 Mar. 1866.

15,088. (*Capt. Galton.*) Has such a proposal ever been made to the railway companies?—In our negotiations we have always endeavoured to induce the companies to put us on the same footing as the public at large, but as I have mentioned before, we have never made any definite proposal to the railway companies generally for the conveyance of parcels separate from mails.

15,089. (*Mr. Gower.*) How do you account for the companies exacting more from the Post Office than they do from private traders?—Because they find that in practice they can succeed in extracting more from us. We are to a great extent at their mercy; the public service must be performed, and if we cannot get it performed by agreement at rates which we consider fair, we must have the service performed and trust to the mercies of an umpire. But it is well known, at least it is fully believed, at the Post Office, that the arbitrations in most cases go against the department, therefore it is not at all to be wondered at that the railway companies try to force the Post Office into ordering the service, leaving it to be paid for by arbitration.

15,090. (*Capt. Galton.*) Where there is more than one route between different towns, why cannot the Post Office resort to the same means which traders resort to, and make a special agreement with one railway company as against the others?—Because those two routes are not competitive, except so far as regards the terminal point. In most cases the Post Office has to serve the intermediate district also. Take the case of the mail from London to Dover, it goes through the centre of Kent; our mails conveyed on that line are distributed by branch carts in a sort of fish bone fashion on both sides of the line, but if we were to transfer our mail to the London, Chatham, and Dover line, we could, it is true, send the Dover bags by that line, but we should still have to employ the South-eastern line for all the intermediate district, so that practically the Post Office gets no advantage except as regards the bags for a few terminal points at which the competing lines join.

15,091. (*Mr. Horsfall.*) From what you have said it would appear that you are of opinion that the umpires do not decide fairly?—On the contrary, I believe every gentleman who has acted as umpire for us has given a perfectly honest, and in intention at least, fair decision. What I have stated goes to this extent, that the view taken by umpires as to what constitutes "reasonable remuneration" differs materially. I have never for one moment doubted that every umpire who has been called upon to act for us has given a perfectly honest and conscientious decision.

15,092. Then the other inference is that the Post Office were expecting to have the work done upon too low terms?—No, I think there is a third alternative, and that is that the umpire has not taken a dishonest but a mistaken view, and that we have suffered in consequence of that.

15,093. You think in most cases he has taken a mistaken view?—Decidedly.

15,094. (*Lord Stanley.*) Have you not at different times made a great number of different persons umpires in these questions?—A large number of different umpires have acted for us.

15,095. Do you lay down as a general rule, that the umpires are unfavourable to the Post Office?—I think the general leaning of the umpire is towards the railway companies, but we have succeeded in many instances in having cases referred to umpires who have given rates with which the Post Office has been perfectly satisfied.

15,096. Do you think that this alleged bearing against the Post Office goes further than this, that they think you ought to pay liberally for a service which is compulsory, and which is necessarily attended with some inconvenience to the railway companies?—I think that their expectations go beyond that. They expect the Post Office to pay rates very much higher than would be paid for corresponding service by the public, therefore I should say that their expectations are not merely for liberal payment, but for extravagant payment.

15,097. (*Sir R. Hill.*) The system of arbitration is disliked not only by the Post Office, but by the companies, is it not?—I believe it is not at all liked by the companies, not only on account of its uncertainty, but also on account of its dilatoriness.

15,098. There have been instances, have there not, of companies waiting for years for the award of umpires?—Sometimes companies have been kept out of their money, much against our inclination, for many years.

15,099. (*Capt. Galton.*) Is not that a hardship upon the company?—I do not think it is a hardship upon the company, because the delay has in many cases been more their fault than ours, at any rate, as much their fault as ours. The delay has chiefly arisen from the inability of the arbitrators to agree on an umpire.

15,100. Does not the Post Office pay on account in such cases?—Paying on account in some cases would act as an inducement to the companies not to bring the matter to a settlement, but wherever a fair representation has been made to the Post Office, it has been usual for the department to pay a sum of money on account.

15,101. Were not the Great Western Company for several years kept out of their money?—They were.

15,102. To the amount of several hundred thousand pounds?—I believe the amount eventually paid them was as much as 150,000*l.*

15,103. (*Sir R. Hill.*) Did not that delay arise from the neglect of their own arbitrator?—The delay arose, if I recollect rightly, not so much from the neglect of their own arbitrator, as from his unwillingness to agree upon an umpire, notwithstanding that a large variety of names were submitted to him by the Post Office arbitrator. But the case occurred many years ago, and I am speaking from memory.

15,104. Has it not been offered by the Post Office, under such circumstances, that some one of high character, as one of the judges, for instance, should be asked to nominate an umpire?—That has often been proposed, and often been rejected. I may mention that one of the objects of the bill that I have referred to, the Duke of Argyll's bill, was to provide a means of selecting an umpire in cases where the arbitrators were themselves unable to agree.

15,105. (*Chairman.*) When you have not made a contract for a term of years with a railway company, may you have the charges referred to arbitration at frequent intervals?—The Post Office has no right at any time to claim a fresh reference to arbitration unless the service has undergone a change. If the service remained the same for 10 or 20 years, the Post Office could not claim a fresh arbitration, but where the service changes a fresh arbitration can be claimed by either party. On the other hand, the railway company can at the expiration of three years claim a fresh arbitration, even although the service remains perfectly unchanged.

15,106. (*Sir R. Hill.*) There is a reason, I think, for that; it is an equitable arrangement, is it not? Perhaps you will explain why that is so?—The power of opening the award at the end of three years given to the railway company is no doubt given because, practically, the Post Office, having it in its power to change the service whenever it likes, can open the award at any time; but every Postmaster-General that I have known has scrupulously avoided exercising that power for the mere sake of getting rid of a heavy award.

15,107. (*Chairman.*) Do I understand you to say that in your opinion the Post Office has to pay more for its book post than the railway company would be able to charge to individuals for carrying those as separate parcels?—What I said amounted to this, that the railway companies benefited rather than not by the book packets forming part of the mail, because the rates received for them as part of the mail were greatly in excess of the rates they would receive for them if they were sent as booksellers parcels.

15,108. Do you know whether book packets are

carried to a very great extent upon railways ?—I have no knowledge at all upon that subject.

15,109. I think you suggested, that if a parcel post were established, it might be of use to form regulations for dividing the total income into certain proportions between the railway companies and the Post Office ?—I think that if the persons representing the interests of the railway companies and the persons representing the interests of the Post Office were to meet, they would find no great difficulty in putting the proposed arrangement on a basis perfectly satisfactory to both parties.

15,110. Then you think that an arrangement of that kind might be made for ordinary letters and for the book post also ?—No, I do not think that railway companies have anything to do with the conveyance of ordinary letters.

15,111. Do you think the payment of the railway companies might be established on a footing of that kind, that is to say, a certain proportion of the gross sum received by the Post Office ?—I do not think the Post Office would be disposed to negotiate upon such a basis as that.

15,112. (*Sir R. Hill.*) The Post Office has a monopoly by law of the conveyance of letters ?—It has.

15,113. But no monopoly for the conveyance of parcels ?—No.

15,114. (*Chairman.*) It might apply to the book post as well as to the parcel post ?—The book post service at present is performed at a loss by the Post Office.

15,115. Have you the means of distinguishing that separately ?—A very careful inquiry was made a short time ago, at the time when the Postmaster-General was desirous of affording facilities for the transmission of patterns by post, and it was then ascertained, after a somewhat elaborate inquiry, that the newspaper and book post was performed at a loss.

15,116. (*Sir R. Hill.*) Was not that owing mainly to the high charges made by the railway companies ?—It was owing partly to that.

15,117. I believe you have a general knowledge of the arrangements of the clearing house ?—I have not any knowledge of what those arrangements are, but I know the object of them.

15,118. You know that the several companies have an arrangement for the division among one another of the receipts for the conveyance of goods and parcels which pass over a succession of lines ?—I do.

15,119. Probably some extension of that system might be applied to the parcel post ?—I should think that the facility for carrying out a small parcel post, on the basis I have described, would be very materially aided by the arrangements of the clearing house.

E.J.Page, Esq.

20 Mar. 1866.

15,120. Have you not in the Post Office now existing an arrangement with certain companies by which the varying weight of the bags sent by ordinary trains is ascertained roughly, but in a manner sufficiently accurate to satisfy all parties ?—With one of the Companies who have been induced to convey the bags at parcel rates, a composition arrangement has been entered into, by which the average weight of a bag is ascertained at a certain period, and a sum is paid on the assumption that the weight will usually be about the same ; but either party can, at any time it has reason to think that the weight has decreased or increased, claim a reconsideration of the weight which formed the basis of that composition.

15,121. Are you aware of the arrangement which exists between the British Post Office and several foreign countries for dividing the postage of letters passing between this country and such foreign countries ?—I have understood, although it is out of my department, that arrangements have been made by which the necessity for weighing each separate letter has been altogether got rid of ; and an equitable basis formed, by which the postage has been divided between the respective governments, based on certain proportions of weight taken at specific periods.

15,122. Although the rate to be divided is very high, being in some instances at least 1*s.* an ounce on the gross weight of the letters, still the arrangement has proved satisfactory to all parties interested ?—I have heard it stated that the arrangement has worked exceedingly well, but as it is beyond my department, I am not able to speak decidedly upon that point.

Before I leave, I wish again to mention what I stated just now, that in any opinion which I have expressed I have only given my own, and that I wish to guard myself against in any way pledging the Postmaster-General or the Secretary of the Post Office to a concurrence in my views.

15,123. (*Chairman.*) Do you recollect whether the bill that you have referred to met with general approbation from the railway interests ?—There was, I believe, a sort of combination among the railway companies to defeat it, if possible.

15,124. Was it introduced in the House of Lords or the House of Commons ?—It was introduced in the House of Commons.

15,125. Did it pass the second reading ?—It did not. It was withdrawn.

The witness withdrew.

Adjourned till Thursday next at 12 o'clock.

Thursday, 22nd March 1866.

PRESENT :

THE RIGHT HON. THE EARL OF BELMORE.
THE RIGHT HON. LORD STANLEY, M.P., F.R.S.
THE HON. E. F. LEVESON GOWER, M.P.
SIR ROWLAND HILL, K.C.B., F.R.S.
T. B. HORSFALL, ESQ., M.P.
ROBERT DALGLISH, ESQ., M.P.
CAPT. DOUGLAS GALTON, R.E., C.B., F.R.S.
WILLIAM POLE, F.R.S., *Secretary.*

HIS GRACE THE DUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

THOMAS ELLIOT HARRISON, ESQ., examined.

T.E. Harrison, Esq.

22 Mar. 1866.

15,126. (*Chairman.*) You are a civil engineer in extensive practice ?—That is my profession, but circumstances have placed me in the position of also being really a manager of railways for several years.

15,127. What railways have you been the manager of ?—In the year 1834 I constructed almost the first line of railway in the County of Durham. That was the Stanhope and Tyne. Of that I was manager for many years, and afterwards in the year 1848, when the Committee of Investigation broke up the entire system of the York, Newcastle and Berwick Railway, I undertook, for a period of five years, the entire management of that system. I may state that I have been consulted more or less upon matters of policy as affecting Bills before Parliament, as well as engineering, by almost every railway company in the kingdom.

15,128. Are you immediately connected at present with any of the larger railway companies ?—I am engineer-in-chief of the North-eastern Railway Company, and I am also consulting engineer to the London and South-western, but that is confined more to parliamentary practice than anything else.

15,129. Have you been general manager of other railways besides the small railway to which you have alluded ?—To the North-eastern. In fact it was during the period of the difficulties in which they were all

T. E. Harrison, Esq.
20 Mar. 1866.

placed that I became their general manager, and I continued to be their general manager, as well as their engineer, until the time of the amalgamation of the whole of that system which now forms the North-eastern railway.

15,130. The first point upon which I will ask you to give your opinion is with respect to the equality or difference of charges. Do you agree as to the expediency of the rule that charges should be equal under similar circumstances?—In the abstract, most undoubtedly, but in my experience of it there is great difficulty in defining what is strictly meant by "under "similar circumstances." The experience which I have had is that the rule is one which ought not to be read too stringently; and, provided you place all traders and manufacturers upon the same footing, and do not give an advantage to one over the other, I think that the rule requires, if anything, further relaxing instead of being made more stringent.

15,131. Can you give any illustrations of what you mean by traders being placed altogether upon the same footing?—I will take the case of a number of collieries that are situated at different distances upon a line of railway. If you adhere to the stringent rule of making a mileage rate applicable to all, you may, undoubtedly, shut out of the market the more distant collieries; and I think, in a case like that, instead of adopting the rule of a fixed rate per mile, or even a graduated scale per mile diminished according to distances, to give all the advantages to the traders, a little infringement of the rule under "*similar circumstances*" may be necessary. The result of adopting one rate per mile to collieries situated within 10 miles of a shipping port and 20 miles of a shipping port, practically is to shut up the whole of the distant collieries, and I have advised the adoption of a graduated scale, making it higher for those nearer the port of shipment and diminishing as you went farther, still making the gross charge higher for the more distant collieries. Although in adopting that principle we reduced the rates to the nearer collieries, and, on the whole, made a large reduction, yet the result of it was to bring more distant collieries into the market, and as a railway company we derived a much larger benefit from the reduced rate than we before did from the uniform mileage rate, which practically excluded the more distant collieries. One of the points, which was a great deal debated, was, whether within the strict meaning of the words "under similar circumstances," assuming that those collieries were passing for a portion of the distance over the same line of railway, this principle could be adopted. We have adopted it, and the benefit has been so great that we have not had it called in question, but it was suggested that we were transgressing the strict letter of the law.

15,132. I think it appears from some evidence which has been given before us that all railway companies now consider the rule as to equal charges as not to apply to different distances on the same line?—Yes; I think that is what it practically comes to.

15,133. Is your gross charge in all cases higher for longer distances than short distances?—The gross charge in all cases up to a certain point is, but we find by experience that collieries situated at a distance that would make the rate of charge amount to more than 2*s.* per ton would practically be excluded from the market taking coals for shipment. Therefore, with the exception of some few which are at a very long distance, we have adopted 2*s.* per ton as the maximum charge. A colliery which is situated perhaps 20 miles from the port of shipment would be charged 2*s.*, and a colliery situated at 30 miles from the port of shipment would be still charged the same. That can hardly be said within the strict letter of the law, which says "under similar circumstances," to be exactly the same thing; but, in practice, I am quite sure that it is a most beneficial rule to adopt, and that is one of the reasons why I suggest that the rigidity of the rule, if anything, ought to be relaxed rather than otherwise.

15,134. Practically that rule of equal mileage rates, if it ever was compulsory, has been relaxed long ago by the railway companies?—It has often been the subject of threat.

15,135. Have the owners of the collieries that are near the port ever raised the question in a court of law?—They have not raised the question in a court of law, but they frequently have raised the question as one in which they have thought we have treated them unfairly. I believe that is a most legitimate mode of dealing with it. With reference to the North-eastern system, there are some collieries which have three ports open to them, the nearest port, perhaps, may be 50 per cent. in distance nearer to the colliery than the more distant one; but we give the option of going to either port, taking the lowest rate, or the rate upon the shortest distance to the nearest port, as the basis. Having established the basis, we say, Now if you choose to go to any of the other ports you can do so; we give you the option of going to which you like.

15,136. Do those collieries which may consider themselves to be injured by the application of the rate to one port derive a compensating advantage from the opportunity afforded them of shipping their coals at other ports?—Not in all cases; in some cases their situation is such that they cannot avail themselves of it by any possibility.

15,137. What is your rate with respect to coals taken inland?—With regard to coals taken inland, it is a varying rate entirely with the circumstances. Coals to London will bear a limited amount of charge only, or they do not go at all, and the question becomes purely a commercial question. You arrive at the maximum amount which they can pay; having ascertained that amount, then the question arises whether it is worth while, as a question of profit, to carry them at a lower rate. We may make this comparison: take coals which go to London and pass over a certain distance by way of York, they are in all probability charged at a rate per mile 50 per cent. less than coals would be charged going to York, and there stopping. That is exactly similar to the case of a passenger going from London to Edinburgh. The charge from London to Edinburgh is within 2*s.* 6*d.* of the sum charged if you go on to Perth or Aberdeen. There is a limit to the amount which the traffic will bear; and that is much more the question to be decided than the question of any rigid rule as to any rate per mile.

15,138. I presume the railway companies have adopted that system because they thought it the most profitable one to themselves?—Undoubtedly; but I also believe it is the system which is most conducive to promoting the traffic of the country. The basis of establishing a rate is often influenced by matters I may say, totally irrespective of questions of mileage rate. That has been my experience, and I quote as an instance of that a matter which lately came under my consideration. Take the case of a large iron producing district, you have there certain elements for the production of iron; you have coal, coke, ironstone, limestone, and all at hand; but a particular class of ironstone is wanted to enable you to inprove the quality of the iron which you are producing in the district. In the case to which I refer it almost required that, to bring a particular class of hematite stone a very long distance it should be carried at prime cost. I am quite prepared to say that the case might arise in which a railway company would be entirely justified, irrespective of other matters, in carrying that ironstone at the prime cost. I have so advised them, and it became a necessity, for this reason, that looking at it purely as a commercial question, everything that you can do to promote the improvement of the quality brings to the railway indirectly large advantages. If you look at it simply as a question of carrying this iron ore over the line itself it is quite obvious it would not pay, but having all the other raw materials at your command, the advice which I gave in that case was, that if the iron ore were carried at prime cost it might be worth the while of the company to do so in order to promote the interest of an immense producing district. That is

one of the views, which I think is purely a commercial view, which railway companies are under the necessity of taking.

15,139. (*Lord Stanley.*) That is to say you are content to do one business at a losing rate, or at a rate without profit, in order to develop another ?—Clearly.

15,140. (*Sir R. Hill.*) And also in order to promote the interests of the railway company ?—And also the interests of the district, because the interests of the district will be promoted by that course being adopted. Suppose in the first place that by improving the quality of your product you enable the merchants to increase their manufacture and also to increase their sale, every ton of iron that you manufacture indirectly brings with it to the railway company a large traffic in various ways, you increase the population, you increase the consumption of that population, you increase your travelling, and therefore the point that I wish to place before the Commission is that this sort of case often arises, and must be decided on a broad commercial view, and not upon the mere simple question of whether or not the thing will pay.

15,141. Still it would appear that you would arrive at the same result if you altogether disregarded the public interests and thought of the interests of the railway only ?—Clearly so ; but my experience of it is that wherever you improve the manufacture of a district you increase the traffic on the railway. It is equally obvious that in doing so you would confer a public benefit. Railway companies cannot promote their own interests without at the same time, according to my experience, promoting the interests of the district. Then, as to the question of differential rates. There are different qualities of this particular ore used for entirely different purposes. There is the ore which is used in furnaces for smelting ; there is another class of the same ore used for the puddling furnaces ; and the question immediately arose whether under the words "like circumstances" if you reduced the rate of one you must not reduce the rate of the other, the two being carried in the proportion of 20 to 1. There was no necessity for reducing the rate on one. That is a case in which I think that, although it might strictly, according to the letter of the law, be held that if you reduced the rate on one you must also reduce the rate on the other, is one of those cases in which you ought not to act too stringently in determining that question.

15,142. (*Capt. Galton.*) Then you think it undesirable to have a rule as to there being the same rate under similar circumstances ?—I have stated that I think the rule is good, provided it is applied to all traders alike, I think they ought to be placed upon the same footing ; but if you find that under the same name there is iron ore used for one purpose and iron ore used for another purpose, thus varying the circumstances of those two different ores by there being different applications of them, then that is sufficient to justify you in putting a different rate upon it.

15,143. But they are different sorts of ores ?—They are different qualities of the same ore ; but still that is a very small distinction to draw. It is on that ground that I say cases arise in which I think you ought not to read that rule too rigidly, provided you place all manufacturers on an equal footing.

15,144. Whatever the quantities they take ?—That again goes to another point. If you are deciding that the rate for any particular ore of a particular class should be 5*s.* a ton that rate ought to be made applicable to all consumers ; but if there are different variations of the quality of it which could afford to pay 10*s.* per ton, I say that that particular quality ought to pay 10*s.* per ton, provided you make that rate applicable to all consumers.

15,145. Supposing the same ore is to be put to a different use, would you then allow a different charge to be made ?—I think the rule ought not to be held too stringent in that case.

15,146. (*Mr. Horsfall.*) The principle you have laid down is the principle now adopted by railways generally, of a classification of their goods, is it not ?—It is exactly the same. You classify different sorts of goods ; but it is a nice distinction to draw in such a question as is now put. I think a distinct rate should have application to special circumstances.

15,147. (*Chairman.*) Is it your opinion that any alteration of the law respecting equal charges is required, or do you think that railway companies under the present state of the law are at liberty to construe it, if they think fit, sufficiently ?—I am not aware that the question in such a case as I am putting, has been actually raised. Until it has been found to be deficient, I should not suggest any alteration of the law. We have often had the question raised by correspondence, but it has never been actually brought before any court. I certainly think if you are going to alter the law at all, to make it more stringent would be going in the wrong direction.

15,148. Do you think the right policy for railway companies to pursue is to get any traffic they can, if it pays the prime cost of conveying that traffic ?—I doubt that very much.

15,149. Not under all circumstances ?—No. Without there is some further object I should not recommend any one to carry traffic merely at prime cost, but if indirectly it brings a large accession to the traffic of the railway, then, as in the case I have mentioned, I should say at once, carry it at prime cost, if necessary, because for every ton of manufactured iron about seven tons of raw material are carried, and that adds a large amount indirectly to every branch of the service, if you can improve the manufacture and extend it.
